Q. Did each Republican voter take particular pains to let you and the managers see that he had but one ticket?

A. Yes, sir.

Q. In keeping your poll list did you check off the name of every man who voted a Republican ticket?

A. Yes, sir. I checked off on my poll list the names of 462 persons who each put a Republican ticket in the box. Assuming that every man who didn't vote a Republican ticket did vote a Democratic ticket, and there were only the two kinds of tickets voted at that poll, then the number of persons who voted the Democratic ticket was 186.

THE ARGUMENT OF FIGURES.

As I am not a member of the Committee on Elections I am at liberty to say that the committee is entitled to great credit for the faithfulness and pains-taking care with which it has prepared and presented this case. I avail myself of the following tables, which present the condensed argument with more power of conviction than

could the best selected words. I commend them to the careful study of fair-minded men of all parties:

Precincts.	Number of names on poll list.	Number of ballots in the box.	Excess of ballots over votes.

Total, (29 of the polls).....	2,454	383

At seven of the above-named polls it will be perceived that not a single Democratic ticket was drawn out, and at six others only one Democratic ticket at each. It is true that at three polls in Charleston County, not included in the above list, to wit, the City Hall, Washington Engine-house, and Ben Potter's, more Democratic than Republican tickets were drawn out, and that at several other polls the number of Republican tickets drawn out did not greatly exceed the number of Democratic tickets drawn out, but this arose from the fact that at such polls more Democratic ballots had been stuffed into the boxes than were necessary to accomplish the purpose intended, and consequently the excess was almost equal to, and in two instances even greater than, the number of Republican tickets in those boxes, as at the Washington Engine-house, where there were only 245 Republican tickets in the box, while the excess was 379, and at Ben Potter's, where there were only 45 Republican tickets in the box, while the excess was 59.

Every Republican vote drawn out was a loss of one to Mr. Mackey, and a gain of one to Mr. O'Connor. On the other hand, by the drawing out of a Democratic ticket Mr. O'Connor suffered no loss, because the excess being created by placing Democratic tickets in the box, whenever a Democratic ticket lawfully voted was drawn out one of the Democratic tickets illegally voted was counted in its place, so that the contestee's vote was not reduced thereby.

Mackey is elected by 879 majority by the returns of the Democratic managers of the election:

	M. P. O'Connor.	E. W. M. Mackey.
Vote certified and declared by the State board of canvassers.....	17,569	12,297
Deduct the vote fraudulently returned by the county canvassers of Charleston County as the vote of Haut Gap.....	1,052	19
Add the correct vote of Haut Gap, as it was counted and returned by the managers of the election.....	16,517	12,278
Add the vote of the following polls, which the county canvassers of Charleston and Orangeburgh refused to count and canvass, as required by law, to wit:	16,563	13,315
Calamus Pond.....	119	511
Strawberry.....	90	573
Biggin Church.....	63	380
Enterprise.....	161	385
Brick Church.....	16	732
Ten-Mile Hill.....	5	603
Black Oak.....	11	393
Fogle's.....	40	254
Fort Motte.....	85	279
Lewisville.....	236	700
Bookhardt's.....	69	212
Total vote as counted and returned by the managers of the election.....	17,458	18,337
Majority for E. W. M. Mackey upon managers' returns..		879

But the actual majority for Mackey over O'Connor upon the whole case, after purifying the returns made by the managers, stands as follows:

	O'Connor.	Mackey.
Aggregate vote returned by the managers of the election..	17,458	18,337
Deduct vote returned from those polls where the ballots in the boxes exceeded the names on the poll list.....	14,435	9,933
Add the vote of those polls as corrected.....	3,023	8,404
	10,107	14,004
	13,130	22,408
		13,130
Majority for Mackey.....		9,278

THE CONSPIRACY AND ITS EXECUTION.

The proofs in the case cannot fail to convince any unprejudiced mind that the general procedure in carrying on the election was, on

the part of the Democrats, the result of preparation, plotting, and conspiracy. The disregard of law and right evinced a desperate determination, and the care, ingenuity, and variety of the methods used establish the fact that those who plotted and those who performed knew that they were in a minority.

The premature opening of the polls; the refusal to allow to the supervisors an inspection of the boxes; the unusual places at which some polls were held; the inconvenient and uncommon elevation at which boxes were universally placed; the suspiciously large apertures made in the boxes for receiving the ballots; the working into the boxes of a few check-back imitation tickets, to furnish a basis of false representation; the creation and general use of tissue ballots; the surcharging of the poll lists with names of men not voting to fit ballots never voted; the painstaking searching out of Republican ballots honestly voted in withdrawing from the boxes to conform the number of ballots to the poll list and avoid the excess caused by stuffing; the rejection of boxes, returns, and votes, upon petty and unfounded pretenses; the scheming to rob communities of their votes by unfounded allegations of intimidation; the burglary of the box; the stealing of returns and votes and the substitution of votes never polled; the circular of Democratic State executive committee, seven days before election, directing as to the withdrawing of excess ballots and to destroy unseen; the appointing by the Democratic county commissioners of both managers for every poll in the three counties from members of the Democratic party, and the spiteful hatred shown before, at, and after the election toward United States marshals and supervisors, conclusively prove the existence of a conspiracy, involving a whole party, to control the results of the election at all hazards—a conspiracy cunning in its methods and unscrupulous and relentless in its execution.

MR. DIBBLE'S POSITION.

Now, Mr. Speaker, how comes Mr. Dibble into this case? Is he without knowledge and without notice? Is he like an innocent descendant finding himself unconsciously in the possession of property to which his ancestor had no title? Is he unadvised, like an innocent consignee of a ship laden with fever-infected clothing? No, sir; he was chargeable with notice of all of the facts of the case when he sought to succeed O'Connor, and when he accepted the certificate which assumed to assert his own election. He ran on the same ticket with O'Connor. His name was on those tissue ballots. He was voted for as a district elector. His name appears in every report of the managers, supervisors, and canvassers. He cross-examined some of contestant's witnesses as O'Connor's attorney, and examined some of O'Connor's witnesses for him.

Dibble makes an affidavit as to Marshal Wallace's appointments and circular. He files objections to the use of the plaid ticket by Republicans in Orangeburgh County. He protests against the counting of the Lewisville vote and also against the counting of the Fort Motte vote, and again against the counting of the Fogle poll vote.

The four polls rejected in Orangeburgh County by Mr. Dibble's management wrongfully abstracted over one thousand Republican votes from the count. He is chargeable with notice of all of the acts by which his predecessor obtained his certificate.

But O'Connor received but a minority of the votes cast while Mackey received a majority of them.

O'Connor never had a right to a certificate of election.

The assumption of his election was baseless from the beginning.

His claim was without color of right.

It was a fraud in fact and legally never had any existence.

Dibble is but the successor of O'Connor, and as O'Connor had nothing, Dibble succeeds to nothing.

THE EIGHT DAYS FILIBUSTERING.

The clamor made by the opposition in this case upon allegations that the testimony has been tampered with, and that forged depositions were presented, has been examined and shown groundless. It is but the struggle of a defendant who can only avoid judgment and its execution by postponing trial. The reaffirmed and twice-proved depositions show beyond dispute that Mackey was elected. Nothing is left in dispute but the amount of his majority. If it be claimed that Mackey has been guilty of any act during the contest that unfits him to remain a member of this House, that can be presented upon charges after he is seated, and an investigation can be called for. The question now before us is whether Mackey was legally elected in 1880. The claim that the delay and the great and expensive waste of time suffered at the most important part of the session is because of the belief that by forgery or tampering with depositions a serious outrage was being committed is flatly contradicted by the facts developed day by day.

About the time of the disposition of the Lynch-Chalmers case the South Carolina State Democratic organ, the News and Courier, said:

The Northern Democrats hanker after the independent vote in the North, and have a good chance of securing a big part of it next November, but that vote will cost more than it is worth if the price paid for it is the surrender of the Congressional districts in the South which the Republicans claim as their own. Southern Democrats will not consent to be ground to pieces between the upper and nether millstones of national Republicanism and Northern Democracy. The South is the backbone of the national Democracy. Break it, or even weaken it, and there will not be, in our day, another Democratic President.

Here was the lash with the knot at the end of it. The reference is not merely to the Mackey-Dibble case, but it fairly includes all

Southern election cases. It is notice to the "Northern Democrats," and refers to the "Congressional districts of the South." Soon came the response, as follows:

WASHINGTON, May 15.

The indications are that the minority of the House will delay action as much as possible in the contested-election cases which are expected to come up during the week. In conversation on the subject to-day, a prominent member of the minority said that if the contested-election cases were forced ahead of the regular appropriation bills the chances would be that the session would extend into August.

It covers the "contested-election cases."

Then, May 22, we are told—

If a quorum is obtained the result will be the same, but the work of filibustering will be harder. If sixty Democrats hold out they can filibuster against a quorum all the summer. RANDALL, on taking the leadership of the case, had it understood that, once taking it, he was going to fight to the last in every possible way.

May 25, a correspondent gives order No. 1, as follows:

I saw RANDALL's general orders No. 1 this evening. It shows better than my words could how systematic are the Democratic preparations for a siege and how unlikely the party is to fail. Here it is:

"BLACKBURN, KENNA, CARLISLE, and RANDALL will lead the minority in turn, each for six hours. The Democrats will be divided into two squads of fifty men each, or as many less as may be necessary to call the yeas and nays. One squad will be on duty for twelve hours and will be relieved by the other, which will remain on hand for the same time, or until the first relay returns to duty. Messrs. ERMEN-TROUT of Pennsylvania and CLARK of Missouri are intrusted with the charge of these squads, and will see that they are on hand during their turn."

And the State Democratic organ immediately responds:

Not only in South Carolina! The Democrats everywhere in the South will learn from the fight which Mr. RANDALL superbly leads that a *new departure has been taken*, and that the jeers and snarls of the Stalwarts will not deter the Democrats in Congress from cleaving to their friends as the Stalwarts invariably cleave to theirs. It is all that was wanted to secure to the national Democracy a clear majority in the House of Representatives on the 4th of March, 1883.

Here is the record made by the obstructionists themselves.

The origin, development, and expected results of the revolutionary obstruction are laid bare, and it is not needful that a Republican should add comment.

The "filibustering" was purely political in its origin and its objects. Let the people pass judgment upon it!

Let us now see whether Congressional districts North and South will approve and will send men here to repeat it.

THIS CASE.

Mr. Speaker, this is the case before this House. By the Constitution "each House of Congress shall be the judge of the election and returns and qualifications of its own members."

Upon the facts of this case I believe that the laws of the mind as well as the laws of the land require us to "judge" that Edmund W. M. Mackey was elected a member of this House for the second district of South Carolina November 2, 1880. Being personally qualified, he should take the oath of office and occupy the seat which belongs to the constituency which elected him.

Mr. Speaker, it is contrary to nature and to the course of human affairs that the perpetration of offenses like those disclosed in this case can be continued and repeated without the most serious and painful consequences.

The acts degrade the participant while defrauding the opponent, and tend to create disorder and violence. Like other wrongs they will return to torment the wrong-doer. The American people are determined that there shall be, so far as their jurisdiction extends, at all hazards and at every cost, at every voting place upon our soil a fair vote and an honest count. All parties proclaim it, and no party that seeks or consents to profit by a false vote or a dishonest count can escape the consequent disgrace and degradation.

To allow this tangled skein of artifice, cunning, fraud, and crime to hold back the rightful member from his seat would be to disregard the fundamental principles of our Government and trifle falsely with the sacred rights of citizenship.

THE REAL ISSUE.

But the question presented is far broader than this election case. Let no one mistake or belittle the great issue which this case represents. This is no mere local partisan contest that has in a struggle between individuals been forced temporarily into public sight. It is the "old dragon" of State rights appearing again. It is the domination of caste and race. It involves the defeat of majority rule, the nullification of constitutional safeguards, the humiliation of United States officers, the degradation of United States courts and laws, and the dictation of the membership of this House by the canvassers and governors of States.

The colored vote of South Carolina is stated to be at least 120,000, and the white vote less than 80,000, and shrewd observers familiar with the facts doubt that there are 500 colored Democrats in the State. Yet not a Representative generally supported by the colored voters is returned as elected to this House. The fact of the defeat of the majority is not only admitted but is sought to be justified upon the plea of self-protection and self-defense.

Pending this contest the public declarations are open and unequivocal.

Colonel John Cunningham, in "an open letter" to the people, dated May 9, and published in the Charleston News and Courier of May 13, 1882, uses this language:

Hence arose for the whites of South Carolina a life-and-death matter of pure self-defense and of State preservation, a paramount necessity. This consisted in

getting at all hazards in 1876 possession of the State government and of holding it ever since. This possession was their birthright, and this necessity is their fundamental, inexorable duty. I have no right to kill a man wantonly, but if I kill one in defense of my life and its rights it is neither a crime nor a fraud. The life of South Carolina is as dear to her and to civilization as ever "the life of the nation" (God save the mark!) could have been to the sectional, high-wrought, venal corruption which controlled the United States, even to the cruellest war and persecution, from 1860 to the election cases of 1882.

For this sacred heir-loom purpose our whites had to seize and use the very election machinery which the Radicals and their deluded African followers had prepared against them. Necessity is above law, paramount over human affairs, and in compelling our white citizens to "count out" the African votes, it precluded all criminal or fraudulent motives on their part. It was patriotism perforce for their hearthstones! This desperate situation, an outrage upon all enlightened humanity, was forced upon us by bellicose persecution, and in clear conscience we can challenge any American community to a comparison, by any standard however high, in either moral or political sentiment. Since in Congress Thaddeus Stevens and his majority there, seeking to establish Seward's "higher law," proclaimed themselves to be encamped outside of the Federal Constitution and in defiance of it, their Northern followers to-day have no right to point their fingers in scorn at us. They did it in unconstitutional outrage against others; we are better men in only doing it in genuine self-defense.

And in the trial of the managers of the Hope Engine-house poll for offenses committed in this same election involved in contest, Colonel C. R. Miles, one of the counsel for the defense, is reported as using the following language in his address to the jury:

We are all familiar with instances in which the most fundamental principles of civil liberty have been vindicated, and the dearest safeguards of freedom have been preserved, through the instrumentality of popular elections, which have been carried by agencies which no moralist can sanction in the abstract. English liberty has on many occasions been preserved against the encroachments of arbitrary power by the election of unprincipled demagogues, and through corrupt practices.

No gentlemen of the jury, when you hear all this talk about the purity of the ballot box and about purging the people of South Carolina from election crimes, what does it come from, if it exists at all, except from the debasement of the suffrage? And when these offenses, if offenses they are, are to be thrown off, we must go to the bottom and root of the evil. When the franchise itself is redeemed and elevated and purified, the crimes against it will cease, and not until then. We do not justify such practices or desire their perpetuation, but we must as practical men recognize that as long as human nature remains what it is they will be resorted to, where the evil sought to be arrested is regarded as worse than the demoralizing influence of the practices themselves.

To apply these suggestions to our present condition, I say that all the alleged crimes and practices against the suffrage grow out of and are due to the debasement of the elective franchise. The evils which States and communities have suffered from the degraded franchise have been greater, in the estimate of large numbers of good men, than the injurious consequences which they recognize as incident to the employment of the agencies made use of to counteract or prevent them. If the laws for the protection of the franchise have been violated it has been in the efforts of communities to free themselves in their civil life from the intolerable consequences which the degrading of the franchise has brought upon them.

And also the following:

But it is contended that the managers drew out more Republican tickets than they did Democratic, and that they did it by feeling those tickets and drawing out those they knew to be Republican. We submit that there is no power of the State law which prohibits such a mode of drawing, and, that not being expressly prohibited, the managers cannot be convicted under this information, even if the jury believed that they did what they are charged with.

Considering the doctrines thus set forth as the views of those who "are almost exclusively the owners of the soil and other property" it is not strange that the election trials just had in the United States courts but before local juries should have all failed, nor that the local press should have lauded the "just jurors" and denounced the national courts.

Consider this from the before-named paper, May 5, 1882:

In the construction of State laws the decision of the State courts must and should govern the United States courts. Otherwise the United States court becomes more powerful than the State government, and can nullify any State law, or give to that law a construction diametrically different to that which is given by the State courts.

And consider this, from the same source at a later date in an article commending the calling of the Legislature to redistrict the State into Congressional districts:

It is, moreover, for the interest of the State to strengthen the Democratic party. This was demanded by the conduct of the Government in the political trials in Charleston. The State must be Democratic, or pass into the hands of the Independents, who are only Republicans "writ large." The choice is between the rule of the white man and the rule of the negro. If there was ever any middle ground, it was washed away by the juggling and lawlessness in the United States court. It is, also, the sentiment of the State that unqualified support must now be given to the national Democratic party. There will be no lukewarmness in the Congressional elections. The national Democracy and the South Carolina Democracy are shoulder to shoulder again, and will remain so.

And the following from the editor of the Marion Star, under date of May 11, speaking of the present Administration:

The recent proceedings in the United States circuit court in Charleston, when the Government officers attempted to pack negro juries without intelligence or character to try citizens for political offenses, are a sufficient indication of partisan recklessness to unite all honest men against it.

In a letter to the New York Times under date of Orangeburgh, May 18, James L. Sims, editor of the Times and Democrat, says:

In South Carolina there are 600,000 negroes, ignorant and influenced by a race prejudice which amounts to a religious hatred for the whites, to be so controlled that they may not interfere with the material advancement of the State. Their ignorance may be overcome partially by education, but their race prejudice is based upon the color of the skin and texture of hair, and never can be destroyed by human effort. This northern Republicans know, yet they will force them upon the South, not because of love for the negro, but to perpetuate their power over the country. The negro knows the same truth, yet he will blindly obey his Radical masters, not because of any respect for them, but to rule the white man because he envies his complexion, his superior condition, mental capacity, and moral worth. Let Northern Republicans cease their war upon the South, abandon their insane efforts to elevate the negro to a position he can never be made capable of

occupying, and the Southern whites, who really do not hate the negro, can and will care for his race and make him what every good citizen wishes him to be, a free and worthy citizen of this great country. The negro will never rule the South again.

And J. A. Wood, editor of the *Watchman and Southron*, in the same series of letters, says under date of May 26, 1882:

Their party principles are very loosely defined; the issues upon which every political struggle is fought are honesty *versus* vice, ignorance *versus* intelligence, Africanism *versus* Americanism. In such a contest the Democrats have not been excessively particular in the way in which they conquered. The end was sometimes supposed to justify the means, and they have laid themselves liable to the charges of fraud in elections.

A new State registry law will be in force at the next election. A quotation from a recent editorial commending it is painfully suggestive:

But the Democrats will gain in other ways. They will know in advance where the heaviest opposition vote must be cast, and they can adjust their canvassing to the strength of that opposition, putting in the hardest work where most converts are required.

And a lurid light is reflected by the following:

[From the *Anderson Intelligencer*.]

When our people understand that the good of the State requires the registration law, we have no doubt that the men who have given weeks and even months of their time in red-shirt companies to the redemption of South Carolina, will cheerfully give the few hours necessary to the retention of the government which has done so much for the State. Wherever the registration law has been tried it has worked like a charm throughout the South. The men who have rescued South Carolina from her oppressors will not hesitate to submit to the laws which have been tried successfully in Mississippi, Alabama, and many cities, and are now deemed necessary to the welfare of our own State.

These extracts from leaders of public opinion prove conclusively that it has been and is the determination of the Democrats of the section in question to override and overturn the majority whenever that majority is Republican, regardless of right or justice, voters or votes, constitutions or laws.

CONCLUSION.

Now, shall this lawlessness continue and become the permanent custom of a portion of our country, the defrauded colored men to be counted in adding to the number of the Representatives they are cheated in attempting to vote for? Or shall the Constitution be amended so as to exclude colored men from voting and colored people from being counted in making up the number of Representatives? Or shall equal rights and the Constitution as it is be maintained? These are the questions underlying the contest of to-day.

How will our fifty millions answer them? District Attorney Melton, an honored South Carolinian, to the manner born, said a few days ago to the jury in the Hope Engine poll case:

It is impossible that you can do better for the people of South Carolina than to go with me heartily and honestly in endeavoring to restore the old time-honored honesty and integrity of the ballot-box. Do that and I know the God of justice and good government will smile upon us all alike. Refuse to do it, (and there is my right to speak for South Carolina,) refuse to do it and the grand old State for whose record and history it is my birthright to feel loving reverence—the grand old State will keep its track in sackcloth and ashes forever.

The fifty millions will say: "Let us restore the old time-honored honesty and integrity of the ballot-box."

The colored man is a citizen and a voter by the Constitution of the nation. He must remain a citizen or become a serf. Let him be protected by law in all his rights, and let him be assured that in all civilized nations protection by law includes, if necessary, the employment of treasure and of arms. Let him know that in this nation protection by law comprehends the organized will and power and force of the nation.

Mackey vs. O'Connor.

SPEECH

OF

HON. JOHN H. EVINS,

OF SOUTH CAROLINA,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, May 31, 1882.

The House having under consideration the South Carolina contested-election case of Mackey vs. O'Connor—

Mr. EVINS said:

Mr. SPEAKER: I regret that I will not have the opportunity to discuss this case as I desired. I know it seems like taking part in a solemn farce to address a jury after they have rendered their verdict, but there are some things I desire to state, and will avail myself of the few moments given me to do so.

The lofty disdain with which the gentleman from Massachusetts [Mr. RANNEY] and the distinguished gentleman from Texas [Mr. JONES] treated the law of this case is equaled only by the contempt they displayed for the facts. [Applause on the Democratic side.]

I have no doubt they are good lawyers, that they are able men, but it seems to me it was arrogating somewhat to themselves to say

that our friends on this side who have discussed the legal questions with so much ability [Mr. ATHERTON and Mr. MOULTON] did not know what they were talking about. Why, the gentleman from Massachusetts went so far as to say he did not have patience even to listen to the legal argument of Mr. Dibble's counsel before the committee. I appeal to any fair-minded member on this floor who has read the able and convincing argument of General Paine in this case, whether anything said by the gentleman or by any one else who has spoken in the interest of the contestant has disturbed its logic or weakened its force.

I do not pretend to know much of law, but I have some just appreciation of what a legal argument is when I read it or hear it. But that which has struck me with most amazement in this case from the beginning to the end—and I speak not as a partisan, but as one whose blood runs cold—and whose feelings revolt at the fraud, corruption, and perjury which meets us at the very threshold of this discussion, that members on that side of the Chamber can talk of it as if it were an ordinary contest, brought in the regular and ordinary way into this House. [Applause on the Democratic side.] [Mr. RANNEY rose.] My distinguished friend I hope will not interrupt me, because I have only a few minutes' time allowed me.

My friend from Massachusetts, in almost tragic style, gathered his robes about him as in lofty strains he spoke of the outrages and corruptions in elections at the South, while at the same time he looked complacently down into the upturned and smiling face of Mr. Mackey (who sat at his side) with an air that said, "As to this immaculate gentleman, I find nothing in his case or in his conduct to condemn!" [Laughter.]

Mr. Speaker, as I listened to the plain, convincing, unanswerable statement of the facts of this case made by the gentleman who opened the argument on this side, [Mr. DAVIS, of Missouri,] I remarked to some one by my side at its conclusion that if Mackey had been indicted for corrupting this testimony, with such a speech as that made to the jury, the penitentiary would have opened to him instead of the doors of Congress. [Applause on the Democratic side.] I say there is no escape from the logic of that argument.

It carries conviction in every line and in every word to those who are willing to listen and desire to come to an honest conclusion. If he had been so arraigned, I am sure neither the ingenuity of the learned gentleman from Massachusetts, nor the legal acumen of my friend from Texas, nor the eloquence of my Readjuster friend [Mr. PAUL] of Virginia could have saved him from conviction.

What are the simple facts found in the history of this record, and what do they show? I put it to you as honest men, as honorable men, even though your verdict is virtually made up. Let us see. In the generous and noble impulses of his nature, Mr. O'Connor made an agreement with the contestant to take this testimony; one which waived many of the safeguards of the law. He committed his case, so far as the integrity of the contestant's testimony was concerned, to the hands of his opponent; and while his friends were keeping watch around his dying bed, what was Mackey doing? Manufacturing a record by which he could get the seat in Congress to which the dying man was justly entitled. But gentlemen have told us that "there is nothing wrong in these pages;" that this record shows enough to seat Mackey, and that should end all further inquiry; that it matters not that the testimony was committed to Mackey's tender care and keeping, instead of being sent here directly by the stenographer. "There is nothing," says the gentleman from Massachusetts, "in the charges made against the conduct of Mr. Mackey;" and he dismisses them as "trifling" and "trivial;" and the gentleman from Texas says, "We are blind and cannot see anything." Why, in the first place, Mr. Speaker, this testimony is shown to have been taken by Hogarth, the notary of Mackey. It is turned over to Mackey; Mackey himself admits this, and furnishes the proof of the conspiracy between himself and Hogarth. He says that he entered into an agreement with Hogarth to violate the law; to have Hogarth turn over the testimony to him to be recopied; testimony which it was the duty of the notary, under the law, to certify to the Clerk of this House under his own hand and seal without permitting it to leave his possession. He furnishes himself the evidence of the conspiracy with Hogarth. Can there be any question that this was a conspiracy? Why, Mr. Speaker, this agreement contains the very definition of a conspiracy. It was an agreement to do an unlawful act. What evidence is there that it was carried out? This man Smith—this man whom the gentleman from Virginia loaded down with epithets, and when he could not find any strong enough to express his indignation, resorted to the ponderous volume he held in his hand which contains so much of infamy and villainy, the report of the committee on the frauds in the South Carolina Republican Legislature, to find language sufficient to describe this monster in human shape; and yet this man Smith, who they say is such a rascal and bribe-taker, is the man chosen by Mackey to take the custody of his testimony; chosen by him and taken into his own house; employed by him to copy the testimony, some of it being transcribed at Mackey's house, some at the United States court-house, and some at the room of Smith. Now, Mr. Speaker, if Mackey had been looking for a man to do this job, to do it successfully, to keep it a secret, as it was kept for more than a year, could he have found a man more suited to his purpose than such a man as this Smith is shown to be by those who defend the

claims of the contestant? This same man Smith and others employed by Mackey copy this testimony and it is sent in the name of Hogarth to the Clerk of this House. Mr. Dibble accidentally finds out after the manuscript has been sent to the Printer that not a syllable of it, except the signature of Hogarth, is in his handwriting.

The distinguished gentleman from Massachusetts talks about "pretense;" he had a great deal to say about the pretense of this side of the House, and yet he sees no pretense in the thin guise of pretended haste with which Mackey attempts to cover up the real motive he had in recopying Hogarth's "rough copy" of the depositions.

What an excuse! Will any gentleman look me in the face and say in his heart and conscience he believes any such thing; that Mackey's sole object was to put a clean copy of the testimony here for the use and information of the House? Why, you have seen Hogarth's handwriting—

The SPEAKER. The gentleman's time has expired.

Mr. EVINS. I ask the House to indulge me for five minutes longer. Several members objected.

The SPEAKER. The Chair understands objection is made to extending the time.

Mr. DIBBLE. I will yield, if the gentleman desires it, five minutes of my time.

The SPEAKER. Does the Chair understand the gentleman from South Carolina to yield any portion of his time?

Mr. DIBBLE. If my friend wants five minutes, I will gladly yield it.

Mr. EVINS. I cannot take the time of my friend. I know that he will want all the time that has been allotted him. But as the House has extended the time of other gentlemen, I hope there will be no objection to extending mine.

The SPEAKER. It can only be done by unanimous consent.

Mr. McLANE. I ask leave that the gentleman from South Carolina have the privilege of extending his remarks in the RECORD.

There was no objection.

Mr. EVINS. When interrupted by the fall of the Speaker's hammer, I had endeavored in a very hasty manner to show how diligently and skillfully the members of the committee who support the claims of the contestant had avoided the real issue in the case, and was proceeding (as I was forced to do for want of time) to glance very hurriedly at some of the facts which display in a striking light the corrupt action of the contestant in procuring a false and fraudulent record to be substituted for the genuine one. Hogarth's bad handwriting and Mackey's haste to have a neat copy of the testimony ready for an expected extra session of Congress is the excuse given by Mackey for inducing Hogarth to turn over the depositions to him to be recopied. Notwithstanding this haste, however, the agreement with Hogarth was to write out his notes in a "rough hand," so that it would be necessary to have them rewritten.

If the only motive for this agreement was to save time, why did he not say to his stenographer, I want you to translate your notes into long hand as soon as possible, but you must be careful to write them out in a plain and distinct hand so that no time may be lost in recopying any portion of them? I think it will require more than the oath of the contestant to convince honest men that his story about this matter states the whole truth, if indeed there is any truth whatever in it. He knew perfectly well in the first place that it was a plain and palpable violation of the law for him to take this testimony into his keeping.

No man knew better than the contestant that it was not only a violation of law but a gross breach of faith toward the contestee to enter into any such an agreement. The instincts of an honorable man would have revolted at the bare suggestion of such an arrangement. Such a man would have suffered the loss of a right eye or a right arm before he would have subjected himself to the just suspicion of fraud and treachery involved in such a transaction. But what of Hogarth's part in it?

I am not sure that I ever saw him in my life, but it is easy to imagine how one occupying the responsible position held by him in this contest, after entering into such an understanding in flagrant violation of his duty, should afterward be anxious to make it appear that Mackey was guilty of no wrong, and had gained no advantage from this corrupt bargain. As he put it into Mackey's power to corrupt the record, every charge of fraud or forgery made against Mackey reflects upon him, and whether he intended any wrong or not when he permitted Mackey to take possession of the record and rewrite it, he is now compelled by the logic of his own action to make common cause with him and to fight on his side.

His subsequent conduct in certifying to the sheets copied by Mackey and his agents, without knowing whether they agreed in any respect with the original draft made by himself, shows, too, either an incredible amount of faith in the integrity of the man who had induced him to consent to so gross a violation of his duty, or an utter indifference as to what might be the character of the testimony to which he affixed his name and official seal. It probably would not be hard to surmise the reason why Mackey did not insist, with Mr. Dibble, that Hogarth should be immediately summoned before the Committee on Elections with his original stenographic notes, to set at rest in the speediest and most satisfactory manner to every one the grave charges made against the purity of the record; but why did Hogarth, who is so deeply involved in this disreputable transaction,

not feel called upon to claim his right to be examined for his own vindication?

He knew that by the terms of the agreement between the contestant and the contestee under which the testimony was taken the signatures of witnesses to their depositions were waived, and that the genuineness and purity of the record depended entirely upon his honesty and good faith. When, therefore, allegations were made under oath by Smith that Mackey had altered it in many instances, and had destroyed whole pages of the translation which he (Hogarth) had made of his stenographic notes, it seems to me he would not, if guiltless himself, have voluntarily furnished Mackey a certificate that certain depositions which Mackey chose to designate "corresponded" with his notes, but would have demanded that he should be summoned with all his notes to testify before the committee. Such a course of conduct would have relieved him from the just suspicion of having acted corruptly in turning over the testimony to Mackey in the first instance and afterward allowing him to deal with it as he chose.

Neither he nor Mackey, however, seem concerned in the least about the foul blot which the admitted facts fasten upon their names. When Mackey is charged with having "willfully, surreptitiously, fraudulently, and corruptly altered and perverted the testimony" upon the oath of one of his political friends, the man he had employed to recopy Hogarth's "rough" manuscript, he does not ask to have his character vindicated from false aspersions by having the stenographer to produce his original notes, but, intent only upon securing a seat in this Hall upon the record as he had made it, he hunts through the by-ways and swamps of three counties in South Carolina to find seventy or eighty witnesses who are willing to sign machine-made affidavits in identically the same words (except as to the pages on which their depositions are found in the volume of printed evidence) that they "have carefully read in the volume of printed testimony in the case of Mackey vs. O'Connor" the depositions made by them, and that deponents "are sure that there has been no garbling of or alteration of their testimony," &c.

The getting up of all these affidavits in the short space of three days was a wonderful achievement and must have been attended with a vast amount of inconvenience, trouble, and no little expense. But why go to all this trouble and expense? Mr. Dibble asked that Hogarth be summoned before the committee, and was willing to rest the truth of his charges on Hogarth's original notes. Why was the contestant unwilling to risk the testimony of his own stenographer on a cross-examination before the committee? Perhaps he was in a hurry again and could not wait until Hogarth could, in answer to a telegraphic summons, travel from Augusta to Washington. It is perhaps natural for a man who thought the quickest way to get the testimony ready to send to the Clerk of this House was to have it so written out in the first place that it would be necessary to rewrite it to come to the conclusion that the speediest way of meeting the charges against his rewritten copy was to employ men to hunt up these ready witnesses.

Most men would have thought otherwise, and some I have no doubt will be uncharitable enough to conclude that these numerous affidavits were gotten up to relieve the strain on Hogarth's conscience; that Mackey came to the conclusion that the fourteen depositions which Hogarth was to fix up were about all he could stand. However this may be, the facts show conclusively that Mackey was unwilling to have the record he had presented in this case tested by the original notes; and Hogarth has been content to rest under the odium which attaches to him for his part in the transaction. Whether Hogarth has or has not actively aided the contestant in preventing the truth from being fully revealed might have been much more satisfactorily shown if the committee had granted Mr. Dibble's request to have the witnesses examined and cross-examined in the presence of the committee. In this connection a very singular fact, and one which seems inexplicable except upon the hypothesis that there was a perfect understanding between Mackey and Hogarth, was mentioned by my friend from Missouri, [Mr. DAVIS.] I beg leave to quote what he said in regard to it:

Mr. DAVIS, of Missouri. Mr. Mackey also presented the affidavit of Mr. Hogarth as to certain depositions, and I will have the Clerk to read the following letter written by Mr. Mackey to Mr. Hogarth, and I hope the House will give its attention to the letter, which has not been heretofore read in this connection.

The Clerk read as follows:

WASHINGTON, D. C., February 23, 1882.

DEAR SIR: In view of the affidavits made by yourself and C. Smith, you will oblige me by reading and comparing the depositions of S. W. McKinlay, J. G. Smalls, J. J. Lessene, G. H. F. Graham, St. Cyprian Delaney, F. H. Carmand, Robert Simmons, J. H. Ostendorf, M. Canfield, George E. Hart, Benjamin Moultrie, Nestor Curry, J. J. Moore, A. Lathrop, E. A. Webster, W. N. Taft, C. Smith, T. A. Haguenin, T. C. Albergetti, and W. A. Zimmerman with your original stenographic notes and forward to me by Monday's mail, if possible, an affidavit as to the result of your comparison.

A copy of the testimony and the affidavits recently filed by Mr. Dibble have been forwarded to you.

Although this request may put you to considerable trouble and perhaps inconvenience, yet, in justice to me, you should not hesitate to do as I have requested. Any reasonable charge for the services performed will be paid by me upon receipt of your bill.

Yours, respectfully,

E. W. M. MACKEY.

E. H. HOGARTH, Esq., Augusta, Georgia.

Mr. DAVIS, of Missouri. It will be observed, Mr. Speaker, that this is a letter addressed by Mr. Mackey to Mr. Hogarth, asking him to compare the depositions

of twenty witnesses with his stenographic notes, to see whether they are correct, or whether they correspond with the printed documents in the case or not. Here is Mr. Hogarth's reply, which I will ask the Clerk to read, and which is given in the shape of an affidavit.

The Clerk read as follows:

STATE OF GEORGIA, Richmond County:

Personally appeared E. H. Hogarth, who, being duly sworn, says: That at the request of Colonel E. W. M. Mackey, as appears by the letter herewith annexed, he has during the past twenty-four hours examined and compared the depositions of S. W. McKinlay, J. G. Smalls, J. J. Lessene, G. H. F. Graham, St. Cyprian Delaney, F. H. Carrand, George E. Hart, Benjamin Moultrie, J. J. Moore, M. Caulfield, Nestor Curry, E. A. Webster, T. C. Albergetti, and T. A. Huguenin, as contained in the printed volume of the testimony in the case of Mackey vs. O'Connor, with the original stenographic notes of the said depositions, and that the depositions as printed correspond in every particular with the original stenographic notes of such depositions.

Deponent further says that the printed depositions of the other witnesses named in the communication of Colonel Mackey have not been compared with the original stenographic notes because of the want of time on the part of deponent.

E. H. HOGARTH.

Sworn to before me this 27th of February, 1882.
[SEAL.]

WM. K. MILLER,
Notary Public, Richmond County, Georgia.

Mr. DAVIS, of Missouri. Now, it will be observed from this reply that Mr. Hogarth compared fourteen of these depositions, as he states—the depositions of fourteen witnesses—with his short-hand notes, and he says he found them to correspond in every particular. Recollect that when this affidavit was presented to the Committee on Elections, Mr. Mackey stated to the sub-committee having the matter in charge, and if I am not correct in this I hope I will be set right by some member of the committee, that on these fourteen depositions he was willing to rest his case; that he was willing to disregard all the balance of the testimony, and that these fourteen depositions, attested by Mr. Hogarth, would prove his case. I believe that was his statement; am I not correct? [After a pause.] Nobody denies it, and I take it for granted, therefore, that that is the fact.

Is there anything remarkable in that circumstance that Mr. Hogarth picked out the fourteen depositions, the very ones upon which this man Mackey, the contestant, said that he was willing to rest his case? I think there is. Now, let us see. We have here a letter which I have had read, from Mr. Mackey to Mr. Hogarth, giving him the names of twenty witnesses who had testified in the case, whose testimony he wanted to corroborate by his short-hand notes. Of course he gave them in a certain order, A, B, C, and so on, and I ask if it would not be entirely natural that the party comparing the names or the depositions with his stenographic notes would have taken them in the order in which Mr. Mackey put them down? Would it not seem reasonable that he should have done so? It certainly would to me. Has he done so? No. He takes the first six names of the list; skips Simmons and Ostendorf and Caulfield; takes the next five in their order; skips Lathrop, the next in order; takes Webster; skips Taft and Smith; takes Huguenin and Albergetti.

In other words, by skipping two names in the first place, one in the next, and two in the next, by accident, he selects the very fourteen depositions upon which Mackey is willing to rest his case. That is a small circumstance, I know; but these are the kind of things that have influenced me in this case; that have excited doubt in my mind as to whether we can rely upon the testimony in this case or not, and as to whether there is a sufficient reason to excite the suspicion that there has been a conspiracy between Hogarth and Mackey to count in Mackey and count O'Connor out.

How can this perfect understanding between the two be explained? There is nothing in Mackey's letter to which Hogarth's affidavit pretends to be responsive, to explain it, and no one can believe that these fourteen depositions were selected by mere chance. Do not these facts so well stated by my friend add force to the charge made by Mr. Dibble a short time since, through the columns of the National Republican, of this city, that there was a secret interview between the contestant and his stenographer in the city of Augusta, Georgia, about the time Hogarth's affidavit was made; and that in reality it was not made, as it purports to be, in response to Mackey's letter, but after a personal conference with Mackey?

Mr. Speaker, I have felt justified in devoting so much time to the character of Mr. Hogarth, and the part he has played in this case, because upon the fourteen depositions which he says "correspond in every particular with the original stenographic notes of such depositions" the majority of the committee base Mackey's claim to a seat on this floor. I believe I have shown pretty clearly to all fair-minded men that the agreement which Mackey says he made with Hogarth was a conspiracy, and that it has been fully carried out. And yet upon the sole testimony of one of these conspirators the other is to be made a member of this House. This is what this side of the Chamber has fought against.

We have asked that the man who had that testimony in his keeping, and who took it from the lips of the witnesses, should be required to bring it here. For this simple act of justice, denied to us by the committee, we have contended in vain with the majority of this House, and are now forced to trial upon a false and fraudulent record. No Democrat has cause to regret the part he has taken to defeat so great an outrage upon truth and justice. Our friends on the other side are welcome to all the glory they have gained as the champions of such a cause. Gentlemen who have refused a proper investigation of these charges of forgery and fraud plant themselves upon the fourteen depositions, and with an air of triumph ask us to point out in what respect these so-called depositions have been changed or garbled. We say they come to us in such a way as to justify us in pronouncing them utterly unreliable.

It is very evident that the stenographer was not free from the powerful influence which the contestant seems to exercise over him when he penned the affidavit which purports to be a response to Mackey's letter. All the circumstances attending the alleged verification of these depositions by Hogarth discredit them. The chairman of the committee [Mr. CALKINS] has been good enough to give us some information about this verification which we never had before. Several days ago, when he occupied the floor upon a question of privilege touching the action of the majority of the committee in this

case, he used the following language in replying to a question propounded by Mr. KENNA:

Now, it stands undenied and confessed that the original notes of the stenographer never were out of his possession, and before the committee would look at the evidence after it had been questioned they required that the depositions should be compared with the original notes. They were compared, and only those that were compared and stated by the stenographer (as the affidavit will soon show) to be the exact evidence; those and none else were used by the committee. The rest were rejected.

This startling disclosure was something entirely new not only to the sitting member but to the members of the minority of the committee. It seems from this statement that the majority of the sub-committee had a private conference with the contestant either before or after he had been put upon time to file "affidavits in reply" to those filed by Mr. Dibble, in which they informed him that "before they would look at the evidence after it had been questioned they required that the depositions should be compared with the original notes." Let us examine the facts as they then stood before the sub-committee, and see if this statement of the chairman of the full committee will not strike members as a very remarkable one.

On the 21st day of February last Mr. Dibble filed a communication with the committee, in which he charged "that Mr. Mackey had willfully, surreptitiously, fraudulently, and corruptly altered and perverted the testimony;" and after stating that "these matters had come to his knowledge very recently," wound up his communication as follows:

I therefore request this committee to make an investigation of these matters, and to ask leave of the House of Representatives to summon the witnesses whose depositions accompany this communication, together with such other witnesses as may be named by the said contestant and myself, respectively, to testify touching the truth of the charges aforesaid, in case the contestant deny the said charges, or to take such other means as may be just, fair, and lawful to ascertain the same; and that the testimony on file in the said case of E. W. M. Mackey against M. P. O'Connor be stricken out, and declared to be fictitious, unreliable, and void.

A number of affidavits accompanied this paper, among them those of Hogarth and C. Smith. Mr. Dibble's counsel had also filed a motion to suppress the depositions because the notary had not certified that they were written out in his presence. A meeting of the sub-committee on these two matters was called for February 26, and on Thursday, February 23, Mr. Dibble was notified by letter that the meeting of the sub-committee had been postponed by the chairman until Wednesday, March 1.

Wednesday, March 1, the sub-committee met. Mr. Dibble stated to the sub-committee that he had presented affidavits in support of his application for an investigation to show that he had foundation for making the charge; that he could not ask the sub-committee to determine so grave a charge on *ex parte* statements, but hoped they would give full opportunity on both sides for cross-examination of witnesses; that in addition to the witnesses who had made affidavits there were other material witnesses who would not testify because they were party friends of Mr. Mackey, and he was satisfied he could not procure their testimony without the power of the House. Mr. Dibble asked them to inspect the manuscript, which they declined to do, and after a private consultation the following resolution was announced:

Resolved, That all affidavits on the part of Samuel Dibble in support of his two motions be ordered filed to-day with the clerk, if not already filed, and that Mr. Mackey be allowed until the 3d of March, 1882, to file with the clerk affidavits in reply thereto, and the same be printed; and that these motions be continued until next Monday at 10 a. m., and at that time these motions shall be determined by this sub-committee, after allowing one-half hour for argument on each side.

Thus matters stood when, according to the gentleman from Indiana, [Mr. CALKINS,] the Republican majority, without the knowledge of Mr. Dibble or the minority members, gave their instructions to Mr. Mackey as to what he should do, and agreed among themselves what sort of testimony should be received and what should be rejected. We had supposed, until we were enlightened by the gentleman from Indiana, that the action of the sub-committee was fully set forth in the resolution we have quoted.

Mr. Dibble had just asked that Hogarth and other witnesses whom he could name, as well as those named by the contestant, should be examined before the committee. He had stated that they were political friends of Mr. Mackey and he could not "procure their testimony without the power of the House." Instead of asking the House to compel the attendance of witnesses the Republican majority, without a hint to their brethren of the minority or to Mr. Dibble as to what they were about to do, inform Mackey that he is "required" to obtain a reverification of depositions from his friend Hogarth, and that they will regard no other evidence but the depositions thus verified.

This, too, was done while the committee had before them the admissions of Hogarth that he had already been guilty of the grossest violation of the law governing his action as notary and the duty he owed to the contestee. What a travesty on a "full and fair investigation!" What a mockery of justice to send Mackey privately to his coconspirator to have him say the false record which he aided in palming off as the genuine one "corresponded in every particular with the original stenographic notes!" But this is not all. The fourteen depositions to be verified are selected by Mackey and Hogarth, and the majority of the committee now say that their finding was based entirely on these, and that all else in the record was rejected.

This, too, is done while the resolution of the committee refusing Mr. Dibble's motion to strike out the depositions as spurious still remains as the deliberate action of the committee. But the gentleman from Massachusetts says "there is no pretense that any of the evidence which proves that Mackey was elected according to the original returns is not now before us as it was given." Mr. Dibble made out such a *prima facie* case against the whole record as to entitle him to expect with confidence an opportunity to prove by competent witnesses what was false and what was genuine; and when the door to investigation is shut in his face it does not well become any member of the committee to say anything in that record is "incontrovertibly proven."

The gentleman himself a moment later, apparently aware that the assertion just quoted was a little too broad, proceeds as follows:

The proof lies in the shape of returns made by the district managers, which alone needed to be proved, and they were proved by the originals when they could be had, and by their contents when any of them had been destroyed, as they had been, some of them, in the office of the county commissioners of election.

But granting that there was before the committee satisfactory proof that according to the managers' returns Mackey did receive more votes than O'Connor, it does not necessarily follow that Mackey is entitled to the seat he claims.

The gentleman admits that a number of boxes, seven in one county and four in another, sufficient to give Mr. O'Connor a large majority, were thrown out by the county board of canvassers. But he says that this was done on mere "pretenses," that there was no intimidation of voters, that "no one was even frightened from their property," and that the action of these canvassers was illegal. The truth is, they did not proceed illegally as the law was then construed by the supreme court of the State, and even this garbled record shows they had before them sufficient proof to exclude some at least of these boxes; and if the whole testimony as delivered by the witnesses in this contest had been allowed to reach the committee of which the gentleman is a distinguished member, who knows but he might have voted to legalize their action? We say that the "trail of the serpent" is all over and all through this record, that none of it is entitled to full credit, and not a syllable of it comes here in the manner or through the channel prescribed by United States statutes.

In the case of Stolbrand *vs.* Aiken, recently reported to the House, my learned friend, supported by the unanimous voice of his committee, took ground which he as well as the gentleman from Texas [Mr. JONES] have entirely abandoned in this contest. In that contest the committee very properly refused to examine the testimony because it was taken by an officer (a United States commissioner) not authorized to take it by the United States statutes, but after quoting the law applicable to the case, the unanimous report concludes as follows:

It would be worse than idle to prescribe rules if they may be willfully and unnecessarily disregarded.

This is sound doctrine, but we have asked in vain to have it applied to the case now pending. It is true the notary appointed by Mackey was authorized by the United States statutes relating to election contests to take testimony, but if he has failed, as he did in this case, to comply with any of the provisions of the statutes which required him to properly certify the testimony, to keep it in his own possession, and to seal it up and send it without unnecessary delay to the Clerk of this House, why should he not stand precisely in the same category with the unauthorized commissioner in the Stolbrand-Aiken case? But the law gathers tenfold force against the consideration of the testimony presented by this contestant when the real facts are stated—that the notary did not seal up said testimony; that he did not send it to the Clerk of this House without unnecessary delay; that he did not send it at all, but turned it over to the contestant to be rewritten by him and kept by him for months in his possession and finally to be sent by him or his agents to the Clerk.

If law is worth anything, if established "rules" are to be regarded, it would be hard to find an instance in which they have been so flagrantly set at defiance and trampled under foot. It is said, however, that Hogarth makes Mackey's transcript evidence by certifying to it as it was brought to him from time to time through the many months during which it was being copied by Mackey, Smith, and others. But, unfortunately for those who take this position, Hogarth himself does not certify, as required by law, that the depositions were reduced to writing in his presence, but, on the contrary, swears that after he delivered the testimony to Mackey, "at various times he (deponent) signed certificates which were tendered to deponent by E. W. M. Mackey, esq., and also jurats at the foot of depositions; these deponent signed without comparison with his said stenographic notes, taking it for granted that said testimony was the same as furnished by deponent to said E. W. M. Mackey, esq.; * * * that said deponent did not have his stenographic notes at hand when he so certified said testimony." This is the certification which the gentleman from Massachusetts says "imports verity." Further comment is unnecessary.

I beg pardon, Mr. Speaker, for again reverting to Smith—C. Smith—about whom the gentleman from Virginia [Mr. PAUL] grew so facetious. He declared that this case "began with Smith," and will "end with Smith;" that Smith was "the political Jumbo of the day," and without Smith there is no case at all. He then proceeded to show him up as a bribe-taker and villain of the deepest dye. The gentle-

man from Massachusetts also speaks of him as "venal and corrupt and unworthy of credit." I am not surprised that they are so worried about Smith. Instead of being a "political Jumbo," he is more like a "Banquo," who will not down at their bidding, but continues to confront them at every step with his charges of fraud and forgery.

After all their efforts to demolish him he remains a living and important factor in this case. If he was a bribe-taker, he took the bribe as a Republican Senator, in a Republican Legislature, in company with a hundred other bribe-takers of the political party of which the contestant was at the time a distinguished and influential leader. If he was a "bribe-taker," if he was "venal and corrupt and unworthy of credit," Mackey knew all about it when he put Hogarth's "rough draft" of the testimony in his hands to be fixed up for the use of the Elections Committee of this House. He knew it when he made him one of his supervisors, when he examined him as the first witness in his case, and certainly knew he was a villain of the blackest hue when he dared to charge him (Mackey) with fraud and forgery; and yet he deems Smith's testimony so important and trustworthy that he goes to him, even after these charges are put on file before the committee, and has him to make another affidavit. The blacker he is painted the darker grows the suspicions that he was selected for the very purpose which he swears was accomplished.

In making these grave attacks, therefore, on Smith, it seems to me these gentlemen have not proved themselves very judicious friends of the contestant. But they say that Smith is contradicted by other witnesses worthy of credit, and, therefore, he should not be believed. I assert that he is uncontradicted by any one except the contestant, and by him only as to the alteration and destruction of the testimony. It is alleged that Major Hagenin, a Democratic witness, contradicts him, and the gentleman from Indiana [Mr. CALKINS] had his affidavit read and printed in the RECORD a day or two ago, as he said, to prove this allegation. Let us examine the two affidavits, and we will see that there is no contradiction whatever, and that Hagenin supports Smith.

In the first place, Major Hagenin's testimony was of such a character as to afford no inducement to the contestant to alter it, and Smith says after it was copied he presented it to Major Hagenin for his signature and "he glanced over it and said, 'I suppose it is all right,' and signed it." Smith does not intimate that there was any change in it, and Major Hagenin in his affidavit now presented by the contestant says, "that there has been no garbling or alterations in or additions" to his deposition. It was to be expected that Mackey would contradict him as to charges which if admitted would send him to the penitentiary, but as to everything else he corroborates Smith's statements.

Hogarth sustains him in very minute particulars as to his own action. Zimmerman fully agrees with him touching what is said with reference to his deposition, and Horsey's affidavit, which was excluded because it came a few hours too late, supports the charges of alteration and destruction. But this is not all. Mr. Dibble in his affidavit swore (and Mackey has not denied it) that the return of the Republican supervisor (one Henry W. Hendricks) at Hope Engine-house precinct, in the city of Charleston, was filled out in the handwriting of Mackey, and this is verified during the progress of a recent trial in the United States court of the managers of this precinct, who were charged with illegal conduct at said election in the following manner. Said Hendricks was called as a witness by the prosecution, and being asked the question, "How did you come to make a report that on the poll list kept by Supervisor Lacoste there were 1,214 names?" answered as follows:

I made no such report; that entry has been made there since I turned it in.

Mr. Levin, another of the witnesses in this contest, likewise testified during said trial that the testimony as printed was not his testimony, and "he knew it had been tampered with since he gave it." During the trial of said managers Mr. Robert Chisolm, chief counsel for Mr. O'Connor, was also called as a witness, and testified that the testimony in the contest between Mackey and O'Connor "was taken down by a stenographer, but he was not at all prepared to say that the printed testimony was what was testified. In fact he knew it was not."

Supported by Democratic and Republican witnesses in every essential particular, and contradicted only by Mackey as to certain criminal acts on Mackey's part, whatever may be Smith's character, he cannot be facetiously put aside as a "political Jumbo," or gravely denounced as a perjurer by my distinguished friends, in the interest of the man who made him his agent, who made him his chief witness, who took him into his own house, who intrusted him with his secrets, who has again and again indorsed his character for truth, and even now presents an affidavit from him upon which the ink is scarcely dry.

While, Mr. Speaker, there are very many other facts and circumstances to which I have not alluded going to sustain the view I have taken of this contest, I feel that I have been speaking long enough to deaf ears, and forbear. We on this side have made a conscientious and determined fight for justice and for the right as we understood it, and as I believe the country will understand it. To unseat my colleague and seat Mackey upon this fraudulent record you have felt justified in abrogating certain rules of this House which are

held sacred in every deliberative assembly in the world where the rights of the minority are respected.

You have prepared the way for Mr. Dibble's speedy exit. He has borne himself here, as elsewhere, like a true gentleman, and will go out without a shadow upon his good name. The door will soon open to Mr. Mackey. Take him to your bosoms and let the country judge between us.

You cannot prove frauds by forgeries. If there were frauds at the ballot-box let the proof which establishes them be brought here in a direct and proper manner, and under the safeguards prescribed by law, and I will be as ready to denounce them as any gentleman on this floor.

Before taking my seat, I beg to say in all kindness to my friends across the aisle, when you have consummated the great wrong you are about to perpetrate, you should forever discard the new catch-words, "a free ballot and a fair count," which you have attempted to appropriate as a party shibboleth, and upon which you have hung so many eloquent utterances during this debate, and never mention them again; should you repeat them the good people of this prosperous land will not credit your sincerity. You will not be able to make them understand the difference between counting a man in here upon forged evidence, and counting him out at the ballot-box by tissue ballots, or any other illegal means.

Mackey vs. O'Connor.

SPEECH

OF

HON. AMBROSE A. RANNEY.

OF MASSACHUSETTS.

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, May 31, 1882.

The House having under consideration the South Carolina contested-election case of Mackey vs. O'Connor—

Mr. RANNEY said:

Mr. SPEAKER: I am at a loss to know whether we are trying an indictment against Mr. Mackey and the majority of the Committee on Elections or determining an election case. We have heard here for two days a discussion of everything but this case. We have heard attacks upon the majority of the committee, and attacks upon Mr. Mackey; but what is this House to determine? Simply whether Mr. Mackey or Mr. O'Connor was elected to the Forty-seventh Congress at the November election in 1880. Now, I propose to discuss the case and not to discuss politics. If I know myself and my associates upon the committee, we have had an eye single only to the truth in every case considered. Without indulging in any general remarks myself, I beg leave to send to the Clerk's desk to be read an utterance of that eminent lawyer and orator, (Colonel Ingersoll,) who has addressed us in another case. It contains sentiments which I endorse most heartily and have adopted as the guiding thought of my action in all cases.

The Clerk read as follows:

The mere personal controversy between the contestants for a seat in Congress is not worth talking about. That, of itself, is not of such vital consequence. The principle involved is. It is a question as to whether or not the republican system is a failure. Unless the will of the majority can be ascertained, and surely ascertained, through the medium of the ballot, the foundation of this Government rests upon nothing—the Government ceases to be. I had a thousand times rather a Democrat should come to Congress from this district, or from any district, than that a Republican should come who was not honestly elected. I had a thousand times rather that this country should honestly go to destruction, than dishonestly and fraudulently go anywhere. We want it settled whether this form of government is or is not a failure. That is the real question, and it is the question at issue in every one of these cases. Has Congress the power, and has Congress the sense, to say to-day that no man shall sit as a maker of laws for the people who has not been honestly elected? Whenever you admit a man to Congress, and allow him to vote and make laws, and there is any doubt as to his title, you poison the source of justice; you poison the source of power; and the moment the people begin to think that any members of Congress are there through fraud, that moment they cease to have respect for the legislative department of this Government—that moment they cease to have respect for the sovereignty of the people represented by fraud.

Now, as I have said, I care nothing about the personal part of it, and may be you will not believe me, but I care nothing about the political part of it. The question is—who has the right on his side; who is honestly entitled to this seat? That is infinitely more important than any personal or party question.

My doctrine is, that a majority of the people must control—that we have in this country a king, that we have in this country a sovereign, just as truly as they can have in any other; and as a matter of fact, a republic is the only country that does in truth have a sovereign, and that sovereign is the legally expressed will of the people. So that any man that puts in a fraudulent vote is a traitor to that sovereign; any man that knowingly counts an illegal vote is a traitor to that sovereign, and is not fit to be a citizen of the great Republic; any man who fraudulently throws out a vote knowing it to be a legal vote tampers with the source of power, and is, in fact, false to our institutions.

Now, these are the questions to be decided, and I want them decided, not because this case happens to come from the South any more than if it came from the North. It is a matter that concerns the whole country. We must decide it. There should be—there must be—such a thing as political morality so far as voting is concerned.

Mr. RANNEY. Mr. Speaker, I may be permitted to say further for myself, that when I took my position as a member of the committee to which you assigned me, I determined that I would make, and join in, no report which I did not feel that I could maintain and defend as a lawyer and as a member of the House, irrespective of all party considerations.

The majority of the committee believe that, while they are investigating election frauds, North, or South, and seeing to it that the people regard the purity and integrity of the ballot-box, it is their duty likewise to see that they, sitting as judges under the Constitution, determine election cases fairly and so that their conclusions may command the respect and approval of all right-thinking men.

We can ill afford to engage in condemning the conduct and setting aside the action of subordinate managers and judges of elections, and ourselves, the ultimate tribunal, violate our duty.

In this case I am reminded of what was once said to me by an old lawyer when I first set out to practice law. I told him that in a particular case of alleged fraud I had not much of a case, I feared, on the proofs. "Well," said he, "make up in noise what you lack in evidence, and when that fails, fall upon and abuse the opposite party and counsel, and you will make the jury believe it." That seems to be what has been attempted to be done here.

There is no case for the contestee in any possible aspect of this record, and this fact seems to have been known and appreciated in some quarters. The other side have appeared to me, and may be charged outside with having acted, more like partisans than statesmen. They may have been misled by wrong or imperfect information, which I am ready in charity to believe is so. If cognizant of the facts, their conduct may lead some to believe that they were afraid to discuss the case and have the facts come before the House and the country, and to meet them upon this floor. For one I am disposed, now we have got before the House, to challenge them to make good their assertions, and to meet us face to face in an open discussion. We have heard these indirect attacks long enough, got in, as they have been as some may be disposed to think, under the specious pretense of debating a question of order, and when no one could fully reply to them in order.

First, Mr. Speaker, as to the merits of the case. I will occupy but a few moments upon these, as my associate [Mr. MILLER] has presented them so fully and ably in his speech. I believe and know that this side of the House, now that they have got this case up for consideration, desire to know all about it, and to see what truth there is in the asseverations that have been made and repeated so often upon the other side, to the end that it may be recommitted if there is just occasion for such a course, and that they may vote intelligently on its final determination. No member should be unseated unless the case made will warrant it.

The case is simply this: Mr. Mackey was elected by 879 votes at all events. How does it appear? On the returns of the Democratic managers of the various precincts constituting the district. The governor of South Carolina appointed commissioners of elections for each county. They were all Democrats. They appointed the precinct managers of elections, and every one of them was a Democrat. There were no Republicans among the managers of election, none on the board of county commissioners of election, and none on the board of State canvassers.

Mr. Mackey was elected by the official returns of the managers of each election precinct to the county canvassers, all of which seem to have been regular in form and duly authenticated as made. It stands so proven incontrovertibly. There is no pretense that any of the evidence which proves it is not now before us as it was given. No one denies it. No one can deny it in truth. Mr. Dibble has not denied it in any affidavit, nor alleged that the testimony as originally taken and as it existed in fact did not show that such were the official returns. He has not pretended in all his charges of alterations in the testimony that the testimony has been changed by anybody so as to make it appear that such was the fact, when it did not so appear before in proof.

Saying nothing of the frauds committed, putting them all aside, letting all the fraud go, and calling everything honest, if you please, (I do not do it, mind you; no one can properly call such conduct by that name,) Mr. Mackey was then clearly elected, and there is no gainsaying it.

Now, what did these county commissioners do after these returns were made? They threw out seven precincts in one county and four in another, sufficient to change the result and give O'Connor ostensibly a majority of 5,272 votes. On what pretense? It was done on protests or charges of intimidation, it would seem. The negroes had been guilty of intimidating those brave South Carolina Democrats, [applause on the Republican side,] and yet the witnesses and district managers have sworn that there was no intimidation, that nobody was interfered with, not even frightened from their property. [Laughter.] It is the settled law of South Carolina, as adjudicated in their own courts, that the county commissioners had no authority to do what they did. They are only ministerial officers, having no revisory discretion or judicial authority in the premises. They were bound simply to take those returns from the managers, count them, tabulate them, and send them to the State canvassers. They were obligated by the known law of South Carolina to do this,

protests or no protests, intimidation or no intimidation, if the returns were duly authenticated.

That is the statute law of South Carolina, and the supreme court of that State has so decided. No one denies it. They did not do their duty, but openly and recklessly violated both statute and duty. They not only disregarded and rejected returns made to them, for no good reason whatever, but ballot-boxes and returns were violated after they had been delivered to them by the district managers, certainly in one instance. A box with the returns had been sent in from one precinct and delivered to the commissioners, which gave contestant 1,037 votes and O'Connor, 46 votes. The returns were destroyed or otherwise disposed of, the ballot-box violated, the ballots changed, and then the vote reversed and returned as 1,052 for O'Connor and 46 for Mackey.

This does not stand on any general charge, but has been adjudicated in the courts of South Carolina by a judge belonging to the Democratic party. A petition for *mandamus* was brought in his court, and Judge Wallace decided on a hearing, as appears by a copy of the record from which I read, that at the time of the delivery of the box to the county canvassers it contained the ballots cast at the election, the statement of the election as made by the managers, and that the violation of the box was subsequent to its delivery by Mr. Wilson to the county commissioners of elections. Mr. Wilson is said to be one of the commissioners. How that is I do not know.

Mr. DIBBLE. Will the gentleman allow me to interrupt him?

Mr. RANNEY. I would rather not, except for a question.

Mr. DIBBLE. He was a manager—

Mr. RANNEY. Yes he was a manager and delivered the box and returns to the commissioners.

Mr. DIBBLE. I only wish to exonerate Mr. Wilson as the judge did.

Mr. RANNEY. It is enough for me to know that the managers or proper officers of the precinct carried the papers and the box and deposited them with the county commissioners, and they received them in the regular way and in legal form. And they were right when they got them. I say that is enough for me, and it is enough for the House, to know that afterward the contents of the box were changed, and a large majority which was shown by the returns to have been given for Mackey was reversed and counted for O'Connor.

These are facts which have never been disputed, and which the record of the testimony here, and the records of the courts in South Carolina, of which copies are here, establish beyond controversy or cavil.

As to the rest of the returns rejected, the commissioners simply violated the law. They took it into their own hands arbitrarily to reject them because somebody protested, and on some claim of pretended intimidation by the negroes over each other, or the managers, I do not know which. Whatever it was, the commissioners acted without right or authority to reject, under the statutes and decisions of the South Carolina courts.

Three precincts are said to have been thrown out, on the protest of the sitting member. How that is I do not remember or care. It is enough that the action was illegal and unauthorized, as must have been known.

Now, what is the form of the proof here on this issue? There is competent and legal testimony to show what the returns were. The returns, or a great part of them, are produced in the form of certified copies or in the originals.

These returns in the first instance were sent from the election precincts to the county commissioners. They are proved by copies or contents, as I have already said. The county commissioners had some of them destroyed. In all cases the proof of the contents of the returns, or what the vote was as returned, is beyond question, and cannot be and is not controverted, and was not attempted to be in the proof adduced; and there has never been any pretense that the evidence which shows this was ever changed. There was no occasion to change it any way. Mr. Dibble has in no affidavit or argument alleged that evidence has been changed so as to show this state of facts when it did not so appear before.

When copies of the returns could not be obtained because the commissioners had destroyed them, how are they proved? In some cases by the Democratic managers of elections, in others by the supervisors, one or both, not by their returns, but by their sworn testimony given in this case. When it is done by the supervisor the Democratic managers, examined by Mr. O'Connor on another issue, either swear to the same or do not deny it. They must have known what the fact was and would have denied it if what the others swore to was not true. Thus we have the record evidence of most all of the returns, and in all other cases we have the sworn evidence of the supervisors, one or both, confirmed by the Democratic managers. Who is there on this floor, or elsewhere, ready to deny these facts? No one has been bold enough as yet to do it. O'Connor did not attempt to disprove them by any testimony taken in this case.

Now tell me if these facts, taken just as they are proved in the record and as summed up on page 11 of the report, with the evidence given in support of each precinct return, are not enough? You will find them proved by incontrovertible testimony as I have shown, and by testimony that has never been questioned or claimed to have been tampered with. That is the main case on the merits. Beyond that, Mr. Speaker, there is a field of fraud, a sea of it, that I do not care to

wade into without I have on high rubber boots. [Applause on Republican side.] I have had enough of it and have seen enough to sadden and sicken a man who believes in fair dealing and in the sacredness of the ballot-box in this country. After examining about a dozen of these cases I can only say that the truth has been but half told. [Applause on Republican side.]

I came here to Congress in the first instance reluctant and unwilling to believe such things, being under the impression that the charges were unfounded, or the facts overstated, and were, at least, to be taken with many grains of allowance. But after having gone through the evidence in many of these cases, and examined many election statutes, and seen how they are administered and perverted, I must give it up. I do give it up. I find fraud refined and cheating reduced to a science. [Applause on Republican side.] It appears and comes up in all phases, and evinces an ingenuity and skill worthy of better employment. In this case there is bald, palpable unmistakable fraud, by which Mackey was deprived of his seat and the certificate given to a man who was not entitled to it. There was fraud to an enormous extent in the precincts. But it did not prove to be enough to accomplish the result, through some mistake or fatality or other, or because some managers proved honest and stood steadfast and true; and then the county commissioners came up to the work, and completed the job by what must seem to be a known violation of law, as well as a violation of some of the boxes and returns after they were received by them.

Now, sir, I shall not ask the House to go through the evidence in further detail and see all the facts which it establishes. I have called its attention to testimony about which there is no question and which is not claimed by anybody to have been altered or tampered with. I have referred to the testimony which proves the majority of 879 votes, and will let this part of the case rest there for the present.

There is no occasion to sound and measure the depth and extent of the sea of fraud which lies beyond and back of these returns. Let pass for the time being the great fraud practiced at Hope Engine-house, where over 1,000 fraudulent ballots were stuffed into the ballot-box by the Democrats, as a basis for what subsequently occurred in drawing out all of the Republican ballots, to reduce the excess of votes over the poll-list under the provisions of a dangerous and vicious statute, so that only 5 Republican votes were left. The person who did the drawing boldly acknowledges that he left those only for the reason that he could not find them when he felt for them.

When the matter of the pretended alterations of the testimony came up for consideration from the sub-committee and before the whole committee, they looked at these facts and this proof and found that none of the testimony alleged to have been altered touched these facts or affected the proof, and they concluded that in any event they were immaterial so far as the result of the election was concerned. My friend from Ohio [Mr. ATHERTON] has been severe upon the members of the sub-committee who heard this case in the first instance, and has attacked them in his speech with his accustomed vehemence, joining in the general clamor which prevails on his side of the House, and rehearsing what he says occurred in committee. Now, I wish to remind him of this one thing: when this case came again before the whole committee on the memorial of Mr. Dibble, which was referred to them, I said in substance to him, after we had gone over the main body of the case again as reported, in view of the renewed charge made, "Mr. ATHERTON, if you will show me any testimony which appears to be altered, and which is material on either side, I will be the last man to go into the House to defend it or prevent investigation or to decide a case upon such testimony."

I got no response, and could see nothing of the kind, and I then could only say to him, and believe, as I say and believe here and now, and shall always say and believe, the case *has* been fully investigated and everything done by the committee which can be reasonably asked of them; that the charges made are a mere pretense, are vague, general, and uncertain, with no specifications on which we are called upon to act further; that they were designed and resorted to by the parties in interest in a pinch, as a pretext for delay and as a miserable subterfuge to prevent the case from being heard and the facts exposed to the House and the country. I think now that it can be demonstrated that this is so.

Now, take the basal facts of this case as I have given them, and which no one can or does deny. Let any gentleman on the otherside, vehement and ardent as he may be—they are honorable men, I know, although they may be carried away, as we are sometimes, by party zeal—let any gentleman get up on this floor and say that any of the testimony, the certified returns, or any of the depositions of the supervisors, or of the Democratic managers, which tend to prove or refute these basal facts, that any of this testimony has been tampered with or altered in the least, and that he believes, and shows that he has reason to believe, that it can be proved, and I know the chairman of this committee, I know every one of the majority would have his right arm palsied and his tongue cleave to the roof of his mouth before he would prevent investigation and fail to give an opportunity to show it.

Mr. PETTIBONE. That is so.

Mr. RANNEY. I would let a dozen men go unseated, I would let a dozen remain seated, before I would sacrifice my honor, my man-

hood, my respect for myself and my position, by attempting to smother anything of that kind or prevent an investigation. [Applause.]

Now, what is the fact? What will gentlemen find if they will but look into this case? There is an animal that baffles his pursuers in the sea when hotly pursued in a way of which we have all read, heard, or seen. But let us have none of that kind of thing here.

Mr. PETTIBONE. Let us have no cuttle-fish business.

Mr. RANNEY. If we do have any cuttle-fish business the pursuers will be found to have too good eyes and too much courage to be baffled in that way.

Now let us examine into this pretended forgery, (so called,) and see what the facts are and what has occurred and been done.

That committee had this evidence before them. There is a volume of seven hundred and sixty-six pages. Every witness examined and cross-examined. Mr. O'Connor had able counsel. Chief among them was the sitting member. There was Mr. Browning, Mr. Barron, Mr. Rhame, Mr. Whaley, Mr. Chisolm, and Mr. Izlar.

Mr. EVINS. May I interrupt the gentleman for a moment?

Mr. RANNEY. Yes, sir; for a question.

Mr. EVINS. I know the gentleman does not intend to do injustice to my colleague—

Mr. RANNEY. I would be the last to do it.

Mr. EVINS. You put my colleague [Mr. DIBBLE] down as chief counsel. I wish to say he was not counsel at all in the case. He was called in—

Mr. RANNEY. Let me call him chief in ability.

Mr. EVINS. He was not counsel in the case at all.

Mr. RANNEY. He was chairman of the Democratic committee of his county and appears to have acted as counsel for Mr. O'Connor in this case.

Mr. EVINS. If the gentleman will permit me, I simply desire to make a statement.

Mr. RANNEY. I find him acting in the case as counsel.

Mr. EVINS. He was called two or three times to examine witnesses in his own county, but he was not employed as counsel, and made no charge for his services. The gentleman spoke of him as Mr. O'Connor's chief counsel.

Mr. RANNEY. You may put him where you have a mind to. He was one of the eight counsel, all chiefs, all seniors, all juniors, as you please; and by their examinations and cross-examinations they are each and every one of them, I should judge, worthy of the chief position.

Now, what do you find? The contestant's testimony comes in here. Under whose seal? Under the seal of Mr. Hogarth, who is a notary as well as a stenographer? It is put in an envelope directed to the Clerk of this House. It is sent here, and we open it finding it authenticated by his hand and official seal.

There it is. And there is no witness examined but what the counsel there cross-examined. The work was thoroughly done. Counsel attend all through the taking of this testimony, examining and cross-examining and taking minutes and having good memories, and doubt all of them have. They know what it was as given; and the testimony comes here authenticated in the way the law provides, sealed up by the magistrate, with everything to import verity.

So, too, the contestee's evidence comes, certified to by the magistrate, and verified in the same way. It is authenticated by a notary. After the contestee's testimony was taken by the stenographer and written out in the imperfect way in which stenographers often write out testimony, it was put into the hands of O'Connor's own counsel, Mr. Chisolm; and he, finding there were some verbal errors—and they a most always occur even among the best of stenographers—called in the son of Mr. O'Connor—and Mr. O'Connor, as I understand from the eulogies pronounced at this session upon him, was a high-minded and honorable man, and I have no doubt his son is also—Mr. Chisolm called in Mr. O'Connor's son and directed him to sit down with Mr. Mackey and correct these errors, whatever they were; and they did do so, and there is not one of them, if you will look over them, that substantially changes the sense or meaning of anything. They are made on the written translation or transcript of the stenographic characters, and everything which was done appears on the depositions sent to the House and now here.

The affidavit of Mr. O'Connor, which is here, says that there was not a thing done nor a change made except by the mutual agreement of both of them; and that he acted by Chisolm's advice, direction, and authority in all he did. There is the affidavit; you can all read it. I refer to it in verification of what I say. It is produced and filed by Mr. Dibble himself.

Now, what does all that amount to? I have had occasion to examine such transcripts with counsel, and I never was accused of forgery, nor had a deposition thrown out on that account. That does not occur among honorable men unless they get into a heated contest, and get baffled and mad, and there is nothing else left for them to do.

Mr. KENNA. Will the gentleman yield for a question?

Mr. RANNEY. Certainly.

Mr. KENNA. I take for granted what the gentleman says, and believe it. But I submit to the gentleman, upon his reputation as a lawyer, that he would not take the liberty of making any altera-

tion whatever in stenographic notes submitted to him in his own case without notice to and consent of the counsel on the other side.

Mr. RANNEY. I do not see or alter the notes at all, but make suggestions of such errors as I find in the transcripts, note them, or otherwise call the attention of the stenographer to them—that is, on the translation or transcript of the notes, not the stenographic notes themselves.

Mr. KENNA. In the entire absence of notice to the other party?

Mr. RANNEY. I would make suggestions of such errors as I found in the transcripts.

Mr. KENNA. Would the gentleman do that without notice to the other side?

Mr. RANNEY. I would make the suggestion to the stenographer that he had made a mistake.

Mr. KENNA. Would you make the change on the paper in your own handwriting, without notice to the other party?

Mr. RANNEY. I would not, of course not further than to note errors or suggestions of errors.

Mr. KENNA. Would the gentleman dare do it?

Mr. RANNEY. You have asked your question and I have answered it; now sit down, if you please.

Mr. CAMP. He has asked it five times.

Mr. KENNA. I want the gentleman to answer.

Mr. RANNEY. You have put your question four or five times, and I have answered it; I will not be further catechised. What I mean to say is this: any man who ever practiced at the bar—and I know a great many men here have practiced longer than I have, but I speak from my own experience—knows that whenever testimony is taken by a stenographer, it is always shown to counsel, who make suggestions where there have been omissions or mistakes. No man will assume or undertake to make any material alteration. He may call the stenographer's attention to it, in order that he may ascertain if he has not made a mistake in copying his notes. But no man will undertake to make any material change without the consent of both parties and the witness.

Mr. KENNA. Now, Mr. Chairman—

Mr. RANNEY. Pardon me; I do not want you to make a speech.

Mr. KENNA. Only a question, and not that if the gentleman objects.

Mr. RANNEY. If it pertains to the subject-matter of my remarks I will yield.

Mr. KENNA. Since the gentleman has, by comparison with his own proper conduct, alluded to Mr. Mackey's conduct in this case, I will ask the gentleman whether he would not say that he never, under any circumstances, would take the original notes furnished by the stenographer, write out a transcript of them and submit that transcript to the stenographer and then burn the original notes?

Mr. RANNEY. I would not; I never see or touch the original notes; could not read them if I did. Nobody pretends here, there is no evidence, and it was never pretended or claimed, that Mr. Hogarth ever permitted to go out of his possession his original stenographic notes. Among all the frivolous pretenses which have been made here it has never been alleged that either Mr. Carroll, the stenographer employed by the contestee, or Mr. Hogarth, the other one, ever did any such thing. The original stenographic notes are kept by their authors and they have them now in their own possession, as we are assured.

Mr. KENNA. The gentleman certainly understands my question.

Mr. RANNEY. I cannot give way any longer. If you are not already answered I shall fail in any further attempt. As to this testimony of the contestee what do you find? It went into the hands of Mr. Chisolm, counsel of the contestee, according to the general custom in such cases and by mutual arrangement—the transcript of the stenographer's notes, not the original notes. He took them, and went into an examination of the transcript to see whether it was correct.

Now, Mr. Mackey never undertook alone to make even a suggestion that anything was wrongly written down or transcribed in the testimony of the contestee. By Mr. Chisolm's direction the son of Mr. O'Connor, I do not know whether he was a lawyer or not—

Mr. MILLER. He was a lawyer.

Mr. RANNEY. I understand that he was a lawyer. He was appointed by Mr. Chisolm, who was one of the lawyers of O'Connor, to sit down and examine if there were errors in transcribing in contestee's evidence. And Mr. O'Connor, the son, a lawyer, a gentleman, and I think a man of truth, says in his testimony which is printed on page 7 of this printed document:

With the approbation of Mr. Robert Chisolm and by his request deponent assisted Mr. Mackey in making such corrections as we both considered fit and proper; and sometimes those corrections were made by the one and again by the other. In no instance whatever was any correction made without the consent of both the deponent and the contestant.

Now, mark you, Mr. Dibble furnishes this affidavit, and no one says aught to the contrary thereof, and all which has been said by the other side about forgery has been uttered with this proof before them for the parties to read.

Yet Mr. Dibble stands here on O'Connor's rights, attempting to impeach his own stenographer, his own notary, and his own son, a

lawyer and an honorable man as he is, and pretends that the son of Mr. O'Connor and Mr. Mackey committed a forgery.

Mr. DIBBLE. Will the gentleman allow me—

Mr. RANNEY. I cannot give way; you will excuse me. You will have a chance to be heard.

Mr. DIBBLE. I do not want to impeach Mr. O'Connor or to be accused of it wrongfully. That is all I want to say.

Mr. RANNEY. I do not want to be interrupted.

Mr. DIBBLE. The gentleman has no right to make a charge reflecting on me personally without allowing me to reply.

Mr. RANNEY. I disclaim any imputation upon the honorable gentleman from South Carolina beyond what the facts show; but Mr. Dibble, the successor of Mr. O'Connor, standing on his rights and having no rights if O'Connor had none, comes in here and puts it upon the record that Mr. Mackey has "willfully, surreptitiously, fraudulently, corruptly, altered and tampered with this testimony."

To prove this sweeping charge which has been hurled at us for a fortnight, the only thing relied on (for there is nothing else as I will show in a moment) is the fact that Mr. O'Connor's counsel and Mr. Mackey, taking the transcript of some stenographic notes, made interlineations and verbal changes. If you will look through all these, as my associates on the committee have done, you will find that not one of them changes the sense or meaning, but only corrects verbal or grammatical errors.

In order to have this transcript express the testimony as it was given, Mr. O'Connor, the son, sat down with Mr. Mackey and corrected these verbal errors. What did they do? They did nothing but what they mutually agreed on as right and demanded by the facts.

What next? This manuscript was sent back to the stenographer, to the notary under whose authority the notes were taken, and who was to become responsible for it when he affixed his jurat and certificate; and it must be presumed that the notary and the stenographer saw and adopted everything there as right and correct, as it was their duty to do, and then sent it in here under the notarial seal.

You accuse a man of tampering with evidence, fraudulently and corruptly altering it, when this is done with a full understanding, in the open light of day, by the consent or with the concurrence of both parties, and is adopted by the magistrate who is responsible for it and who sends it in here under his certificate and official seal. By the charge which is made, you impeach your own magistrate, the son of the deceased *prima facie* member, Mr. Chisolm himself, and then attempt to cast an unjust imputation upon Mr. Mackey jointly with them.

You may examine that manuscript, as I know the other members of the committee did, and you will find what I say to be true. You may take the original as it was before the alterations, if you prefer that. The truth is, this part of the evidence amounts to nothing any way, and you cannot hurt it more than you can spoil a rotten egg. [Laughter.]

You have not attempted to deny or controvert what is proved here, but you have gone into the flimsiest, shallowest, weakest, kind of evidence to show that South Carolina Democrats, brave and honorable men as they are, could be intimidated by this poor, weak, despised negro, and you have failed utterly. You may take all the evidence on that point as it was or is, and it amounts to nothing.

My friend from Maryland [Mr. McLANE] wanted us to eliminate forgery, or, as he calls it, the "allegation of forgery." We should have to eliminate him and all his friends on that side of the House before we could get rid of the *allegation* of forgery. If he wanted to charge forgery why did he not embrace Mr. Chisolm, because the man who advises and procures a forgery is just as guilty as the man who does the act, and he is the man who directed and had it done. Include the young O'Connor also. All concerned are equally guilty, and why should any be left out? My friend talks about what a court would do on such a charge of forgery. I can tell him. They would ask him first to formulate his charge and specify something tangible, and not beat the air with general accusations of forgery. And on the facts appearing as they do here, they would consider him a subject of inquiry as a supposed lunatic if he persisted in the charge. He will have to get a new definition of the word, if he calls this forgery.

Turn now to the evidence of the contestant. What is charged as to that? On what is the charge based? We have the evidence in print and in manuscript, a whole volume of it, direct and cross-examination, given when both counsel were present. That comes here also under the seal and certificate of Mr. Hogarth, the notary, a Democrat in politics, but an acknowledged honest, honorable man. Who will say otherwise? Who has said otherwise? Nobody has said it before the committee. Nobody has attempted, nobody will attempt, to impeach Mr. Hogarth's integrity, his honor, his truthfulness, or his fidelity as a magistrate.

The depositions came here under his certificate and notarial seal, and that seal and that certificate import verity. The attack here also is virtually made on the magistrate, the notary public, the political friend of the sitting member.

Mr. REAGAN. They import verity only where he has authority to act.

Mr. RANNEY. Yes, where he has authority to act; and the au-

thority to act is by mutual consent of the parties and the authority of law given him as a notary public appointed in South Carolina, and under the authority of the Revised Statutes of the United States expressly given in the chapter relating to contested elections.

Mr. REAGAN. To impeach his own record?

Mr. RANNEY. We will come to that. Don't jump until you get to the stile. [Laughter.] You attempt to impeach a magistrate, a notary public. The testimony is sent to the House under the seal of Mr. Hogarth, and is opened in committee. Now you are going to impeach him, are you? Is that fair? Suppose you are in court, having no defense, and want a continuance, and get up and attack a magistrate who had taken some depositions to be used in the cause. I think the court might possibly see through the subterfuge and require some pretty strong proof before counsel could be gratified and get rid of going to trial. If not furnished the court would politely request him to take his seat, and order the case to proceed.

This notary public, after those notes had been transcribed and the transcripts in rough draft sent to Mackey, (as his also were sent for examination to O'Connor, by mutual agreement and understanding between the parties,) and then to Mr. Smith, who was mutually employed to make clean and legible copies of them for use as the testimony, had them returned, and they were then signed by the witnesses after they were read over to them and sworn to anew. Mr. Smith is a beautiful penman and a good copyist, whatever else he is.

It was not necessary for the witnesses to sign, because by agreement the parties had waived it if the witnesses could not be got. But it was done in most every case on the part of contestant, as the record and the affidavits of deponents prove.

The copies, as must be presumed otherwise, were examined by magistrate as well as witnesses, and are sent after this, sealed up, to this House by the notary as the testimony of contestant. In that state of the record this case came before the Committee on Elections. Now, the majority of this Committee on Elections are terribly bad men! They do not grant anybody any advantages or any hearing, you would think! They do not consider anything, according to the gentleman from Ohio, [Mr. ATHERTON.] When they draw their majority report they do not consult him and ask him how they shall draw it! He always dissents any way, as you will see by the minority reports, unless the majority decide in favor of his party, as they have done in some six cases. I think he must have forgotten himself in his vehemence of address to the House when he made this puerile complaint against the members of his sub-committee. Unless they agree with him he seems to think they do not consider anything.

He has never consulted me as to what he should put into his reports, more than I have him as to mine. If he had done so there is perhaps a good deal in some of them that I might have induced him to leave out. [Laughter.] I certainly think that I could have improved some of them, and he probably believes that he could have bettered mine.

It is said that the committee did not investigate the present case. I deny it, have denied it, and can now demonstrate that we did do it patiently and thoroughly. Let us see what was done, and then recur to the alleged forgery again.

On the 24th of January the printed record came in. We took it up first on the question of consideration, as the sitting member began by raising that question as the other side have here. They said that it did not belong there at all, that we had nothing to do with it, and we had an argument on that point.

In the House when it was being organized, as it will be remembered, a resolution was offered to the effect that all of the papers should be referred to the committee when appointed, and meanwhile that neither claimant should be seated. That was voted down and a motion to reconsider was tabled and the sitting member sworn in. Some time in December a general resolution was passed by the House referring all cases of contested elections, which of course carried this one among the number, and yet Mr. Dibble came before the committee with eminent counsel and discussed at great length the proposition of order that the case was not before us; that it was finally disposed of by the proceedings referred to. And the same question is gravely argued at length in the minority report. It is a most beautiful report. [Laughter and applause on the Republican side.] A lawyer would be proud of it. I have not had the patience to read all of it, but I am satisfied that it contains valuable learning. [Laughter.] I commend it to my friends as a legal curiosity on this point—in a matter of parliamentary law. The counsel and my friend, the Democratic member of the sub-committee, argued the point vigorously and with apparent gravity and sincerity.

It rather seemed to me then, and I am not rid of the impression yet, that if there was anything in the point of order (I did not so regard it, however) it should have been raised in the House when the second resolution was offered and passed. The resolution by its terms certainly covered this contest. I hardly believe anybody in the House dreamed that in disposing of the first resolution they had fixed Mr. Dibble irrevocably in the seat assigned him *prima facie*, under objections pending in the contest.

The point was, however, argued with the gravity which is characteristic of my friend from Ohio, [laughter,] and especially of General Payne, the counsel. I looked at him, and there was not a smile on

his face, and there was not a ripple of laughter on the part of the grave and dignified members of the committee. There was not a doubt with the counsel, apparently, upon the question. He was solemn as a hearse, coolly arguing and gravely discussing a matter of that kind, and I must confess that I was amused if not convinced. [Laughter and applause.] But we had to sit and hear argument, and we did hear it, and heard it patiently, and the point was overruled.

Next came a regular plea in abatement. It was carefully drawn and prepared according to the rules laid down by Chitty, with which the special pleaders up in Vermont, where I studied law, were so familiar, and in which they thoroughly indoctrinated me. It was refreshing to see an old acquaintance of the kind again.

What was that plea? Why, that O'Connor had died. The contest had been begun before O'Connor died, and when he died the action died with him. You will find it elaborated and insisted upon in the minority report, and the same ought to be treasured up and kept for its great legal learning! Do not omit to get a copy of the brief of General Payne also on this point. The legal proposition is and was in effect this: a candidate who was not elected, but who got the certificate from the governor, by dying during the pendency of the contest, deprived the man who was chosen of his right to the seat to which he was entitled. [Applause on the Republican side.] It is true that the governor of South Carolina proclaimed then that there was a vacancy, and ordered another election, in which Mr. Dibble was declared elected, and in which there was no opposing candidate. But it seemed to me then, and seems to me now, too clear for argument, that the governor could not create a vacancy by proclamation where none existed before. The contest had not one feature of a personal action such as abates upon the death of one of the parties, either at common law, or by virtue of any statute.

And yet the sub-committee heard the plea discussed. The argument was listened to patiently, and the gentleman from Pennsylvania [Mr. MILLER] although he gets excited sometimes, heard it patiently, [laughter and applause.] and the gentleman from Ohio, [Mr. RITCHIE,] a learned man, heard it with his accustomed judicial bearing, and the member from Connecticut [Mr. WAIT] was there and listened without his wonted smile. They, however, overruled it, the gentleman from Illinois [Mr. MOULTON] alone dissenting, and then it was appealed to the full committee that it might be laid before them and argued again. The whole committee were invited and went in and listened to the argument as repeated and revised. [Laughter and applause.] I was not present myself, however, as I did not feel that I could keep my face straight and preserve my equanimity of temper during another argument of two hours on this point. [Laughter and applause.] I did not go in.

Mr. CALKINS. The rest of us were there, though.

Mr. RANNEY. Certainly. Our honorable chairman, with that urbanity, patience, sweetness of temper, and forgiving disposition, which characterize him, attended and heard it, all unmoved. [Laughter.] You would have thought it was a source of the greatest pleasure for him to sit and listen to that argument; and his fairness and courtesy on that occasion were only equalled by what he exhibited here the other day in this case when a certain proposition was made from the other side. [Laughter and applause.]

After the argument was heard we all sat in *banc* in judgment upon it. I was in the deliberation. We decided it adversely, our Democratic friends alone dissenting; but we took that as a matter of course.

I think all this took nearly a month's time. Contestant got impatient, and charged that they did not mean to hear his case on the merits; and it did seem so. Mr. Dibble had been requested to file his brief, but had not done so. He filed instead a protest. Our friends on the other side are great on protests. When the points of order, the motions to dismiss, and the pleas in abatement were decided adversely, the sitting member and his friends got up, took their hats, and left. No disposition to go into the merits was manifested. There was a great repugnance to that, apparently, the same as has been manifested since on this floor. Contestee made us hear the case piecemeal. Crowding out every other case, we sat and heard it piecemeal. We finally got a brief, another brief. Next came this paper of February 20, 1882. In it he boldly charged that E. W. M. Mackey had "willfully, surreptitiously, fraudulently, and corruptly altered and perverted the testimony of the witnesses who were examined in the said case of E. W. M. Mackey against M. P. O'Connor." We got nothing on the merits. Counsel were hardly equal to that task. This was the next chapter of dilatory objections.

While it was apparent to the committee that this pretended forgery objection came up as the *dernier ressort*, in the last stages of a desperate contest and when everything else was sure to fail, the committee still determined to do their duty and examine it, to treat it as made in good faith. Time was given to file affidavits in proof and in disproof of the charge; and the parties submitted the question to the committee on affidavits—a proper thing to allow and do, as the matter was dilatory and did not relate to the merits of the contest.

Affidavits were filed on both sides, and the case then was argued and submitted on the same and the merits. All the papers are printed and before the House.

Mr. Dibble had from February 20 to March 1 to present his affi-

avits and formulate his charges more specifically. He did it in his affidavit which says that—

In the said testimony filed in behalf of the contestant there are erasures, changes, and interlineations, a few of them in the testimony of witnesses; and those deemed more important by this deponent are in the papers which purport to be returns of United States supervisors of election. The following instances are called to notice.

Now note what these were; see what the committee found as the basis of the charge made, and what this House has for their consideration and action now. One witness was asked whether the deputy marshals were Democrats or Republicans.

"Question. Were they colored men?"

"Answer. I know one or two were not, because I saw them vote the Democratic ticket."

"Q. Did you see the other two vote the Republican ticket?"

These words, by erasure and interlineation, are changed, in the handwriting said to be C. Smith's, so as to read as follows:

"Q. Were they colored men?"

"A. Yes, sir."

"Q. Did you see them vote the Republican ticket? the effect of the change being to relieve the witness from a contradictory statement."

The object of the inquiry apparently was to prove that the two men were Republicans. The testimony as changed, if changed it was, made that fact clear, and was a favorable change for Mr. O'Connor, and he ought not to complain of that. It was trivial and an immaterial piece of his testimony any way.

The SPEAKER *pro tempore*, (Mr. CROWLEY.) The time of the gentleman has expired.

Mr. CALKINS. I ask unanimous consent that the time of the gentleman from Massachusetts be extended.

There was no objection.

Mr. RANNEY. I am very much obliged to the House for its courtesy.

I am reminded that the first affidavit Mr. Dibble took on this alleged charge was on the 8th day of February, showing that he had ample time to investigate it himself, and had done so before March 1, 1882. I have pointed out and read the only alteration he finds and states in his affidavit in support of the charge made with such severity of language. That is all he specifies, and that proved to be wholly immaterial as well as trivial, besides being in contestee's favor, save so far as it affected the credibility of the witness. This whole deposition, if destroyed and laid out of the case, (which is the utmost that can be claimed in regard to it if it had been improperly tampered with, which is not true, as will appear anon,) injures and affects no one, because it is utterly immaterial in the case as presented. Gentlemen who have made or taken up and echoed these charges cannot have examined this matter as the committee have done, else, if they are honorable men as I am willing to believe they are, they would have been silent. I have answered the only specific charge made, and now will refute it in its generality as read.

I have here the sheets of testimony with every single alteration or erasure appearing to be made in that testimony, so far as I have been able to find. It is said that in the testimony there have been made interlineations and erasures. Now, if any man can find any one here that is material, or that amounts to anything, his eyes are better than mine. I find here one place where the word "of" was written twice, and one of these words is scratched out.

Mr. REED. That is awful. [Laughter.]

Mr. RANNEY. And in another place the word "some" is written twice, and one of those is scratched out.

Mr. DINGLEY. That is a corrupt alteration.

Mr. RANNEY. I find in one of the depositions that it first read "I could read the names on the ticket." The word "could" is scratched out, so that it is left, "I read the names on the ticket." What an enormous forgery that is! Here is another case, where it is written originally "Joseph Spratt, jr.;" and that is erased and is written "Joseph Sprott, jr."

Mr. REED. What a horrible thing that is! [Laughter.]

Mr. RANNEY. Yes, awful; on another page they have the word "exhibit" written twice, and they scratched out one of them. In another sentence where it was written "he arrived there after I did, and upon being told"—the word "upon" is written twice, and one of those words is scratched out. In another place it was written "it used to be held at Carpenter's store." The word "store" is scratched out and "hotel" inserted. And in other place it was written "private house;" that is scratched out and it was changed to "out-house."

Mr. MOULTON. What testimony is the gentleman commenting upon? We cannot hear him.

Mr. RANNEY. Here is one where the initials of the name were wrong, an "M" looking originally something like an "H," and it was made "H." In another, "Simms" is made "Sommes." In another place there is the word "Jeff" written; it is made to read "Jack." In another place it was written "witness produced on behalf of E. W. M. Mackey, contestant." "E. W. M. Mackey" is scratched out, and the word "contestant" left. That would save some expense in printing merely.

In another place the word "some" is put in twice and one "some" scratched out. In another place "Carpetsville" is scratched out and "Corbettsville" inserted. In another place is a word which looks to me something like "around;" in the sentence "were any of them around." That is changed to "armed;" they were talking about

whether there were any persons there armed, and that is the right word. In another place "Walker" is changed to "Hegler," which is the correct name. They did not always get the names right. In another place it was written "Hardy Rough;" it should be and was made "Rugg;" a mistake made in taking it down by sound.

Mr. MOULTON. What is the gentleman reading from?

Mr. RANNEY. I am reading from the original testimony of the contestant. I have gone over it and selected everything in it in the way of erasure or change that I could find. In another place there is a word that is something like "stettlering" that is stricken out and "standing" put in. I am taking up the time in these matters.

Many MEMBERS. "Go on!" "Go on!"

Mr. RANNEY. In another case there is written "cast for the Republican Congressman." The words "candidate for" are interlined.

Mr. REED. That is perfectly awful. [Laughter.]

Mr. RANNEY. Here comes the great alteration that is complained of in Mr. Dibble's affidavit, already referred to. There are two lines and two words erased. What is the evidence about it? One of the witnesses swears that he went before the magistrate to sign his deposition and he told him that he had got it wrong, and he insisted on its being changed, which was done. In his affidavit here, got to meet the charge, the witness swears that he has examined the printed copy of his testimony, and that it is right as printed. It is not of a feather's weight, and did not amount to anything, as already shown. It has nothing to do with the case reported. Now, that is done before the magistrate. It is sanctioned by the magistrate and demanded by the witness himself. Now, witnesses have rights. Stenographers do not always get it just right unless they are very good ones, and they sometimes commit errors in transcribing. A witness has a right to insist when anything is wrong that it shall be changed. My rule is that if there is any substantial change made that it shall be made at the end.

Mr. DIBBLE. Will the gentleman allow me to ask him a question?

Mr. RANNEY. If it is not too long.

Mr. DIBBLE. Would it be proper to do that *ex parte* without notice to the other side?

Mr. RANNEY. If the magistrate finds that he has made the transcript incorrectly, it is not only his right but his duty to make it right, without notice to anybody. He had a right to do it here without notice to the parties, because, by the very agreement made between the parties, they were not to be there, and it was left discretionary, when the depositions were transcribed, whether the witnesses should go before the magistrate and sign the testimony or not. When the witness signed it was his right to have the testimony as written out read to him before he signed and swore to it. The agreement made left the matter with the notary in this respect. If there had been any material change of testimony, otherwise than what arose from the error of the stenographer, notice to the parties would have been proper. But there was nothing of that kind in this instance or any other.

Mr. DIBBLE. Will the gentleman allow me to ask him one short question?

Mr. RANNEY. Do not interrupt me now.

Mr. DIBBLE. A very short question. Why did not Mr. Mackey allow Mr. Zimmerman the same privilege?

Mr. RANNEY. I will come to Zimmerman hereafter. Here is another one of these changes. The manuscript now reads, "I had to do so by holding the arm of the manager." Before the word "manipulation," it read, "I had to do so; I could only detect them by holding the arm of the manager." The effect of the change is simply to show the exact meaning, and the error in taking or transcribing the notes was apparent, and was properly corrected on the responsibility of the notary.

Here is another of the changes—the change of a name—William Poole, a Democrat, and nobody denies that it is right as it stands now. Here is another, in the phrase, "the Republican votes and tickets," the words "votes and" are scratched out, leaving the words "Republican tickets."

Another instance is the interlineation of the words "in violation of law." I do not know by whom. It is entirely immaterial in effect. The presumption is that the insertion was properly made as having first been omitted in copying by mistake. In any event these words are entirely immaterial and not of the slightest consequence.

In another case there are the words "objection same as before." It is not in the testimony, but the noting of an objection by the magistrate, and is of no consequence any way. Those are all the alterations which I can find; and I went over the matter this morning again personally. Gentlemen can see and examine the sheets for themselves, and I challenge the closest scrutiny of all this manuscript testimony. I wish the House to see that the charge made is false in general and false in detail, and that the committee have investigated, as bound to do; and to make good my assertion to the gentleman from Maryland, [Mr. McLANE,] who sought to make a personal matter of this thing, although he had no personal knowledge on the subject, and when I had examined the matter. If there is in this whole testimony a material alteration or anything that looks like a falsification I have been unable to find it, and would thank any gentlemen to point out anything which they have found and which has not been mentioned by me.

There is also the allegation of an alteration in a return of one of the supervisors, where the Republican supervisor has returned 639 votes for O'Connor and the Democratic supervisor only 409. This was at a box at which there was flagrant fraud. The managers, it appears, had done more of it than was finally deemed prudent. They first gave the Republican supervisor the figures 639, and after he went away they cut the figures down, and the Democratic supervisor took these amended figures at 409.

I have looked over the evidence, and that is the only conclusion I can arrive at. The discrepancy does not change the result. O'Connor got counted for him the 409—all that the managers gave him in their return—and the supervisors' returns are not used as evidence at all in this case. It is true that some of the supervisors' returns are filled up in the body of them by contestant, but are signed by the supervisor himself. The supervisors got his aid as a lawyer to help make the paper in proper form; but they, as made, are all true and accord with the managers' returns. They went to Mr. Mackey because he was a lawyer, and possibly Republican lawyers were hard to find.

Nobody questions that these supervisors' returns are in exact accordance with the truth.

The transcripts of the evidence were in his hands, and that is pronounced awful! The argument of my friend from Missouri [Mr. DAVIS] yesterday was, that as this man had the testimony in his possession and had an opportunity to alter it, therefore he did. [Laughter.] The logic of that argument is not found in any work that I know of. It is like the mock syllogism which I have heard: "If you do, you do; if you do not, you do not; therefore you do." [Laughter.]

Mr. DAVIS, of Missouri. May I ask the gentleman a question?

Mr. RANNEY. Yes, sir.

Mr. DAVIS, of Missouri. Is it not the law that the officer taking testimony in a contested-election case shall without unnecessary delay certify, seal up, and forward the same to the Clerk of the House of Representatives?

Mr. RANNEY. I have not reached that point yet; wait till I get there.

Mr. DAVIS, of Missouri. I ask whether that is not the law, and whether Hogarth observed that law?

Mr. RANNEY. Wait till I reach that point. The affidavit of Mr. Dibble intimates that in the short time allowed him he had not the opportunity to pick out all the material changes; but I have been over the testimony, and instead of his not having had time to pick them out, I find that he picked out and gave in his affidavit the worst and the only one there was, beyond those merely verbal, such as I have read. And how any honorable men could justify such a charge as he made, based on what I have read, I fail to see.

I will pass on. Some of the testimony taken in Clarendon County is copied in contestant's handwriting. He wrote it for the stenographer, Hogarth, who read his stenographic minutes for that purpose, and that testimony was taken down from dictation. The responsibility rests with the notary, and he compared it afterward and certified to its accuracy. But all this was in Clarendon County, where there is no dispute about the vote. It was counted as returned by the Democratic managers, and is not in dispute.

I pass to the other portions of the evidence on which contestee relied before the committee, and on which he relies now, as proving the charge made.

Here is the affidavit of one C. Smith, who was employed to make clean and fair copies of the rough transcripts of the evidence before they were signed by the witnesses and certified by the notary. He does not name any deposition which was altered or tampered with. Some specification was necessary before the committee was called upon to act on such testimony. On the contrary, it is of the most general and vague character. He mentions Zimmerman's and Hagenin's as the only specification attempted; and as to them he specifies nothing of consequence—revealing the poverty of his pretenses. Hagenin was a Democratic commissioner of election, and his affidavit is furnished by contestant in refutation of the insinuation as to him. He says that he has read his testimony as it stands, and it is right and as he gave it.

Zimmerman was employed by the commissioners, and was called to prove the destruction of some returns. But the commissioner himself swears to that, and the testimony of this witness is therefore immaterial any way. His affidavit is produced here to the effect that he refused to sign the deposition when written out and copied, and that is all. He does not swear that his deposition as printed is not as he gave it. He was a Democrat and an unwilling witness called by contestant and got mixed up some in his examination, and, declining to sign his deposition when written out, the magistrate has included it with the other testimony, unsigned, as he had a right and was bound to do under the written stipulation of the parties. When Mr. Dibble was getting his affidavit he was called upon in all fairness to have him state therein whether the deposition as it appears in the record is as he gave it. As he does not swear to the contrary, is a political friend of Mr. Dibble and a willing witness for him, ready to give and giving an *ex parte* affidavit, the fair inference is that there is perfect accord. All he swears is that the transcript or copy shown him by Smith to sign was not correct, and he refused to sign. He does not, however, state in what respect it

was wrong then, so we can judge of it and see whether the error is substantial or material, or any error at all. Other reasons appear to account for his unwillingness. The committee did not regard his affidavit of any account, especially as the testimony was entirely immaterial, and there was absolutely no proof worthy of consideration to impeach the integrity of the deposition as certified to by the notary and before the committee in regular form. Looking through the other affidavits, we found those given by four of the eight counsel of Mr. O'Connor, who were present at the time when the depositions were taken and attended to the cross-examinations. It appears that the printed evidence as we have it before us was shown to them, as one of them mentions having read it.

Not one of them names any deposition or any portion of a single deposition in the record that is not just as it was given originally. None of them swears that there is any portion of the testimony which is not correctly reported on contestant's side, except that one of them, Mr. Barron, says that a few answers in the testimony of one Boston do not give a fair idea or impression. I have examined the deposition and I can see no defect, unless it be that they did not get the photograph of this counsel and witness when counsel was trying evidently to badger him, and was holding up a paper for him to look at, and getting him to write some words given him in order to convince him that the paper was not his return, as he had sworn, because he wrote the signature and not the body of the instrument. Read the affidavit, and then the testimony, and you will see the ridiculousness of this charge. The evidence is wholly immaterial in any aspect of the case.

Tampering with a deposition will only vitiate and justify the exclusion of that one, as I have already said and repeat; not a hundred others not subject to the objection. Not one has ever been mentioned. Gentlemen on the other side do not name one, but keep up this prolonged cry "Forgery!" "Forgery!" The other five counsel of Mr. O'Connor do not name one deposition, nor a single sentence or a word in any one deposition.

I say let gentlemen on this floor no longer vex the air with their cry of forgery, unless somebody is able to specify, and give us reasonable cause to believe that there is, some ground for the charge. Every charge of this kind, general as it was, received refutation in committee at the hands of the contestant. He expressed no fears from an investigation, but courted it. General as the charge was, and such as no court would regard without more particularity of specification, he sent and got Mr. Hogarth, the stenographer and notary who took and who certified to the depositions under his official seal, to compare the printed record evidence of every material deposition with his original stenographic notes, and they were verified and certified to anew in a sworn affidavit. He compared and verified every deposition covering the proof made as to the eleven precincts in dispute, and the Democratic returns from which contestant is shown to be elected; and the affidavit was before the committee and is printed and is now before the House.

Read it for yourselves. He has since compared and verified the others, nearly all of them; and gentlemen can see the proof of that if they desire. He is accessible, and has been now for over three months; since this unfounded charge was preferred, he has given voluntarily affidavits for each party, which are before the House. He has his original stenographic notes in his own possession and custody, and has never parted with them. Mr. Dibble could have had all the depositions compared and verified if he chose to do so. If he has not done it he betrays his consciousness that the depositions before us are right. If he has done it, he knows they are right and still allows his friends to prolong their unjust cry.

Not only this, but further: contestant got and produced before the committee, and they are printed and before the House, the affidavits of all or substantially all the witnesses themselves, verifying the testimony printed as coming from them. It is said that the affidavits are stereotyped in form. Suppose they are. The affiants had but one fact to swear to. But it is not true. Some of them are varied where some slight verbal errors in names or the initials in names appear as having been wrongly written and not corrected. There are several of that kind, all natural mistakes, and of no earthly consequence, any of them.

Now, as to the credit to be given this Smith. What has been proved and stated already serves to demolish his affidavit, but I have more to say of him. One Holland (page 18) swears that Mr. Smith stated to him that contestant "was selfish, and he hated him, and would do anything to prevent him from taking his seat in Congress."

If Mr. Smith means to be understood that there was any fraudulent conduct in course of copying the evidence by him for the notary, he was a party to it, the guilty person, or a *particeps criminis*. He asks us to believe in his infamy, and on his own confession. He confesses himself, on that assumption, to be bad enough to do such an infamous thing. Take him at his word generally, and he is then bad enough to falsify about a matter of the kind and make a false charge for a bad purpose. It has been shown by the official records of the Legislature of South Carolina that Mr. Dibble himself, acting officially, found and reported this Smith as guilty of taking two bribes as a senator, one of \$1,000 and another of \$500, as I heard it read in this House and not denied by Mr. Dibble, in whose presence the gentleman from Virginia read the report. Comment is unnecessary.

His character is revealed out of the mouth and through the pen of Mr. Dibble himself.

Whoever got that affidavit from Mr. Smith on which the present charge is based and by which alone it is being supported here and as published in the newspapers, must have known this man. I do not believe Mr. Dibble would be guilty of using any improper inducements, and would not even intimate or insinuate any such thing. But if what Mr. Holland testifies to is true, Mr. Smith without promise may have supposed that by giving the affidavit he would ultimately find some one who was less "selfish" than contestant was thought by him to be; or, what is more probable, his hope of reward was in gratifying the "hate" toward contestant, which he avowed to Mr. Holland. It was sufficient for the committee in their investigation of this charge, it must be sufficient for the House to see that the affidavit of Smith is loose, general, vague, and uncertain, without specification of particulars to which to address an investigation, and that it was most fully met and overthrown even in its generalities, with affirmative evidence enough produced to verify and confirm all the material parts of the record evidence.

Unless some other responsible man in this House, on his honor as a member, can get up in his seat and say that he has some well-grounded reason, beyond the affidavits furnished and adverted to, to believe that the evidence on which the committee have relied is not genuine, what more can be asked, what more can be expected, than that the committee should find and act as they have in disposing of this last attempted dilatory proceeding?

The public is interested in this thing, and the controversy rises in interest and importance above a mere question affecting private character. The public attention cannot be diverted from the main question and issue by assailing the contestant personally and putting the majority of the committee on the defensive.

With all due respect for the gentleman from South Carolina, I do insist that no such charge ought to have been made and sounded through the country on the strength of any affidavit by this Smith, whom he well knew was venal and corrupt and unworthy of credit.

Permit me to recur again to the fact which appears to be the main burden of the cry against the contestant. It is said he had the testimony in his hands, so he had an opportunity to alter it; and so of the testimony of Mr. O'Connor, that he had access to that also. I repeat that gentlemen forget that those copies were not the testimony, as that was in the stenographic notes. Before it becomes the testimony the notary takes it, and on his authority and solemn responsibility as a magistrate adopts it and certifies to it, after the witness has also read or had it read over to him, and signs and swears to it, as most all of contestant's witnesses did, and swear they did, in the supplementary affidavits referred to. You are attacking and assailing the notary.

Mr. DAVIS, of Missouri. Will the gentleman allow me to ask him a question?

Mr. RANNEY. Oh, no.

Mr. DAVIS, of Missouri. I merely want to ask a question.

Mr. RANNEY. I cannot give way.

Mr. DAVIS, of Missouri. I certainly yielded to the gentleman yesterday.

Mr. RANNEY. Gentlemen on the other side are not disposed to discriminate; at least they pervert the facts. Stenographers and magistrates always give to parties and counsel transcript notes, often in many duplicated copies, to be looked over and see if they are right. I have already treated of the alleged alterations in the evidence of Mr. O'Connor. I must be permitted to allude to it again. Mr. O'Connor and his counsel were treated in like manner. There was a mutual exchange of courtesies in both cases, such as is usual and right. It seems to have been under an express or tacit agreement. Mr. O'Connor had a notary and a separate stenographer to aid him. Mr. Chisolm, counsel for the contestee, in his affidavit, page 11, says this stenographer (Edward Carroll) "proved himself to be utterly incompetent for the work he had undertaken; that when the testimony was written out by him (Carroll) he went over it and found it utterly inaccurate in many places, and so written as to make no sense, and in no way either a correct or truthful transcript of the testimony as given," &c. Now let us emphasize this thing at the expense of considerable repetition.

Not content with assailing contestant and Mr. Hogarth, Mr. Dibble is here trying to assail the stenographer of Mr. O'Connor, and Mr. Chisolm undertakes the task by this affidavit. In so doing he assails the notary of Mr. O'Connor also, for he, as did Mr. Hogarth, took the evidence when completed and certified to it as correct, and affixed his official seal to import verity. Where will these men stop? They have embraced all the notaries, the stenographers, the parties, the contestant and the contestee, the son of the contestee, the copyist, in their charges of forgery and tampering with the testimony; next have fallen upon the majority of the committee, to whom was assigned the ungracious duty of hearing these election cases, and lastly upon the Republican side of the House, for asserting their constitutional rights and insisting that the case shall be considered and determined! To what shifts are they driven!

Now, this Mr. Chisolm is placed in not altogether an agreeable attitude as an affiant and a man. His affidavit is sworn to February 18, 1882. On January 7, 1882, he wrote and gave to this Mr. Carroll

whom he now assails the following letter, which was before the committee:

CHARLESTON, S. C., January 7, 1882.

Mr. Edward Carroll, jr., has reported in short-hand for me in the case of the contest of E. W. M. Mackey vs. Hon. M. P. O'Connor for a seat in the present Congress of the United States, and I was well pleased with his work.

R. CHISOLM.

Mr. Carroll, in an affidavit, says that "after the examination of some witnesses was completed, he read a portion of his notes to Mr. Chisolm, who expressed himself as fully satisfied, and then employed him to take the rest of the testimony; and that he subsequently transcribed some of same and showed the transcripts to him, and he again expressed himself perfectly satisfied with his work," &c.

We have his transcripts in evidence not copied, and members can see by examining the same just what they were before the verbal errors were corrected by contestant and the son of contestee. Let these speak for themselves.

I pass to one other part of the charge. As to the affidavit of one Horsly, produced and asked to be received by the committee after the time fixed for filing affidavits had expired. I have it in copy before me. It is trivial and of no consequence; speaks of seeing some sheets of paper torn up and destroyed; says he believes them to have been part of the testimony. It does not say he saw them, or read them. Indeed, when it was offered contestant said he knew this man could neither read nor write. That a man who was copying a mass of testimony should spoil some sheets of paper and destroy some would not be strange or unusual, and that fact alone amounted to nothing. He had none of the original testimony, as that was never in his possession. The affidavit was left with the committee and they read and kept it, and then abundant proof was furnished in affidavits which the committee now have that this Horsly was an ignorant, unlettered person, could neither read nor write. The House can see them now if they wish.

The other witnesses which Mr. Horsly names in his affidavit as being able to swear to the same thing, and whom Mr. Dibble said he wanted to get, sent on their affidavits to the committee, and they now have them, subject to the inspection of the House. They prove nothing, and refute all things pretended as to them. So the shallowness of all the pretenses were exposed, one by one!

Their report shows that the minority regarded the issue as tried and determined by the committee, for they pass upon the alleged alterations as an issue of fact. They do not report that it is a case calling for investigation or further investigation, and recommend proceedings to that end, as would have been the course otherwise.

How any honorable men, members of this House, men who have so often spoken of non-partisanship and arrogated to themselves all of that high virtue in the committee, could find and report the issue tried in favor of Mr. Dibble, and find the facts on Mr. Smith's affidavit, using nearly his language, is beyond my comprehension. Let others characterize it in view of the case as now developed. I forbear.

Now, sir, after these reports had come into the House and been here some time; yea, on the day before the case was to be called up to be heard and disposed of, a memorial was put in and referred to the committee, setting up in substance that one Hendricks and one Levin had been examined as witnesses in some criminal trials at Charleston, and had contradicted their evidence as given in this case, and asking investigation further on that account. The committee took it up and fully considered it, and went over the ground again. The memorial only indicated in the most general terms what they had testified to. It was said that Mr. Hendricks had been asked about a Republican supervisor's return, as to who wrote in it a line about what number of names the Democratic supervisor had kept on a poll list, and as to its being in contestant's handwriting. The testimony was not given or set out, as in fairness and on every principle of practice it should be, so the committee could judge of its weight and importance.

The memorial stated that Levin testified that his deposition, as it appears in the printed testimony of the contestant, has been altered in several particulars from his testimony as actually given; and generally that there was at the trial further corroborative evidence of the alteration of the testimony in this case. It again reiterates the charge made before in the same words already cited from his original paper. Well, sir, this was the next and final move in the long line of dilatory action, after the reports had been on file in this House many weeks.

But the committee went over it with our amiable friend from Ohio [Mr. ATHERTON] who last addressed the House. His attention was called to the fact that the memorial did not specify or give the new evidence, or the names of the witnesses, except Hendricks and Levin; that the evidence should have been stated so we could judge of it according to a rule and report which he had himself made in the case of Mabson vs. Oates. Again, we examined the record and showed him that the testimony of both Hendricks and Levin related solely to the Hope Engine-house precinct, and was entirely immaterial any way for reasons already given; that Levin gave his testimony as one of the indicted on trial, and that it was not stated in the memorial as to what he swore to; that the supervisors' return related to the same precinct and was wholly immaterial in any event. The committee concluded that there was no occasion for any more delay and declined to entertain or favor this new

attempt at it. I said to him then what I have already given in substance.

In order to satisfy myself as to the facts afterward, I got a chance to read the evidence given in Charleston, and found Mr. Chisolm had testified and shown that what Hendricks had testified to in cross-examination was not true; that all the testimony given there would have helped, and not hurt, the case of contestant here.

There is one other objection to the testimony which I must answer even if I trespass longer on the patience of the House. It is said the testimony was not forwarded without unnecessary delay. Another technical objection, you see. Now, that is not so. It was forwarded, as it appears from the record, all of it, I believe, before June, 1881, except one package of certified copies (exhibits) and the evidence in rebuttal. That was of no account and was not relied on by contestant. Contestee's evidence was forwarded by the end of September.

There is another technical objection, (no end to them.) The depositions were sent by express, and not by mail as the statute provides. It is well known and has often been held, that the statute referred to is only directory. Had the magistrate brought the evidence to Washington personally and delivered it to the Clerk that would have been equally violative of the statute. The statute says the magistrate shall examine the witness on oath. A literal rendering would prevent the party or counsel from doing it in his presence, and the use of a clerk or stenographer.

It has been so often held that the House is not bound by the statute, as it is a matter within their own exclusive authority, that I shall not discuss it. It is enough that the evidence got here, and was not interfered with after it was sent by the notary.

Mr. DAVIS, of Missouri. Will the gentleman allow me to interrupt him for a moment?

Mr. RANNEY. Yes, sir.

Mr. DAVIS, of Missouri. You say the law does not bind this House. A matter of fact certainly binds this House, and I stated that this man Hogarth made an affidavit that he parted with this testimony and had nothing more to do with it afterward, except that he signed certificates that were handed in by Mr. Mackey and jurats at the end of the depositions, without comparing the depositions with the original stenographic notes. The gentleman from Massachusetts stated that he verified those depositions. I say Hogarth swears he did not and that he knew nothing about the forwarding of them.

Mr. RANNEY. The learned gentleman is partly right and greatly wrong. There is an *ex parte* affidavit of Mr. Hogarth, with some loose general statements got from him probably without his knowing what use was intended to be made of it. It is noticeable for what it omits rather than for what it states. He has reference doubtless to writing off the transcript and giving it to Smith to copy, and to its being brought back for signature of witnesses and his certification. But he has not been got to state about his taking the oath of the witnesses to them after the copies were made and affixing his jurat, and finally doing them up in a package and properly sealing and indorsing them and delivering them for transmission to this House. They came here thus sealed up and indorsed by him, and were opened here in committee by the clerk thereof. Mr. Smith swears that he took them to the express office and took a receipt for them in Hogarth's name. I suppose my friend will believe everything Smith says.

Mr. MILLER. Every one of them was certified.

Mr. RANNEY. And Hogarth certified them. That affidavit (Hogarth's) is remarkable for what it omits of admitted or patent facts.

Mr. DAVIS, of Missouri. I stated what he swore to.

Mr. RANNEY. Yes, and owing to this imperfect and ambiguous affidavit, manifestly got (but not given) for a purpose, contestant had to and did get others from him in order to cure this ambiguity and get the facts as they were. You would have every magistrate stultify himself, and have us believe that he was willing to do it, and had done it. As Mr. Hogarth is willing to give affidavits to Mr. Dibble voluntarily as he has done once, why has he not during these three months got him to compare for him the whole evidence in print with his stenographic notes, and give others if needed?

Mr. Hogarth, to meet and supply what was wanting in his first affidavit, has made the comparison and verifies the evidence as printed. So have the witnesses read the evidence and verified it respectively, so far as it relates to their testimony.

There is no intimation that Hogarth was false and unwilling to give his affidavit of all facts needed. He had done so for both parties. What do you want more, pray?

Mr. DIBBLE. Did not Mr. Dibble ask leave of the committee to summon Mr. Hogarth and Mr. Smith?

Mr. RANNEY. On the contrary, his application was that the committee should do that or whatever they might deem best. They concluded what was best to do, and tried the dilatory charge on affidavits.

The committee had no authority to summon witnesses, and no case was made for an appeal to the House for leave to do so.

The facts have been found against Mr. Dibble. The report of the committee is not conclusive; it is before the House for revision. But do not say that the committee have been derelict in duty.

Mr. DIBBLE. Will the gentleman allow the Clerk to read this?

Mr. RANNEY. No; Mr. Dibble will have his full hour, and he can have it read then, whatever it is. I am done.

Importance of the Mississippi River and Valley.

SPEECH

OF

HON. J. FLOYD KING,

OF LOUISIANA,

IN THE HOUSE OF REPRESENTATIVES,

Friday, June 9, 1882,

On the bill (H. R. No. 6242) making appropriations for the construction, repair, and preservation of certain works on rivers and harbors, and for other purposes.

Mr. KING said:

Mr. SPEAKER: The value of the Mississippi River, to be appreciated, may be compared with that of a railway system of equal length. There are sixteen thousand miles of navigable streams in this great water system of the valley. Their value from a political stand-point, as a bond of union between the States, cannot be estimated. But from the commercial stand-point we can reach an estimate approximately correct. The average cost per mile of the railways of the United States with their equipments has been, in round numbers, \$51,000. At that rate per mile the sixteen thousand miles of the Mississippi and tributaries would have cost \$816,000,000. But these great water-ways are in transportation capacity and commercial value worth at least six times any railways in existence, or \$4,896,000,000, a sum nearly equal to the total cost of all the railways constructed in the United States down to the present time.

The trunk line of this river system from Saint Louis to the Gulf, is 1,352 miles long, at a moderate estimate, worth ten times an ordinary railway of equal length or \$689,520,000.

What, Mr. Speaker, did the people of the United States pay for the construction of these water-ways? Absolutely nothing! They are nature's work, but just as valuable as if constructed by the hand of man at an immense cost. Dividing the continent from north to south, and located in fertile and productive valleys, they are the most comprehensive and valuable commercial highways upon the face of the earth—far more valuable transportation property than that controlled by any railway syndicate in this or any other country. They are the people's lines of cheap transportation from the granary of the nation to the seaboard. What shall we, the representatives of the people, do with this enormous property?

I reply, manage on strict business principles, as skillfully if possible as Messrs. Gould, Vanderbilt, and Garrett manage their respective railway systems. Keep it in such a state of repair that commerce will patronize it, that the people who own it may derive from its use in a saving of transportation rates an annual income of at least \$244,800,000, a sum equal to 5 per cent. of the \$4,896,000,000 invested for the people by nature in this, one of her greatest and grandest works.

It would not seem extravagant, therefore, if 1 per cent. of the value of these water-ways be spent each year in their repair until permanently improved. That would be for the whole 1,352 miles between Saint Louis and the Gulf, \$6,895,200—almost identically the sum asked for by the commission from another stand-point of calculation.

It will be seen that the Mississippi River commission, who have this subject under investigation, estimate the whole cost of the permanent works of improvement on the trunk line at \$33,000,000, this amount to be distributed through a period of years. Now let us for the sake of contrast see what other countries have done for their rivers. I hold in my hand a work entitled *Improvement of Non-Tidal Rivers*, edited by S. Janieki, L. Jaquet, and Pasqueau, distinguished European engineers, in which the question of the best method of improving rivers to cheapen transportation is treated with great ability. It states that France for this purpose alone, after the German war, which had been so disastrous to her, made an appropriation of \$187,000,000.

To this must be added the works done by her on her rivers before this and since that time. This, Mr. Speaker, is civilization. We will do well to display a similar spirit of material development and progress.

Let us also see what the single State of New York has done for the cause of water transportation. Being deficient in rivers, she has built artificial water-ways—canals to intersect the interior and to connect the lakes with the seaboard—at a total cost of upward of \$65,000,000 for their construction, enlargement, and repairs. If wise and profitable for a State to construct artificial water-ways—and it is admitted that it was both wise and profitable, emphatically so—does it not follow that the General Government will derive still greater benefits from simply the improvement of the great natural water-ways of the great and fertile valley.

VALUE OF THE COMMERCE OF THE VALLEY.

What, Mr. Speaker, is the value of the annual internal commerce of this valley intersected by the Mississippi and its numerous navigable tributaries—a valley which contains near 30,000,000 people? It is greater than the foreign commerce of the whole United States,

greater than that of Great Britain, greater than that of all Europe, and indeed greater than that of all nations combined. The foreign trade of the Orient in its palmiest days was trifling in value contrasted with that which annually enlivens and enriches the Mississippi Valley. While the annual commercial reports of our State and Treasury Departments and those of foreign countries, the publications by the advocates of a new merchant marine, and the press have made every one familiar with the volume of international exchanges, the internal exchanges of the United States have, unheralded, grown to proportions so enormous as to eclipse the foreign trade of all seas.

Let me briefly state from official sources a few facts in support of these assertions. The annual foreign trade of the whole world (exports and imports combined) was stated in the last official report of the State Department to be \$14,000,000,000 in value. The total foreign trade of the United States for the fiscal year ending June 30, 1880, was in round numbers \$1,500,000,000. The internal commerce of the United States is never officially reported for the reason that the exchanges between our States are free and no tariff regulations require an official record. But an estimate of its value has been officially given.

The chief of the Bureau of Statistics of the Treasury Department, in his first annual report on internal commerce, published in 1877, drew from certain statistical premises the following important conclusion:

If it were possible to ascertain the value of the commerce between the different sections of the country on the ocean and Gulf and on the lakes, rivers, and other avenues of transportation we should probably find that the total value of our internal commerce is at least twenty-five times greater than the value of our foreign commerce.

His reasons for this estimate were, first, that the estimated value of the shipping engaged in our foreign trade was but \$200,000,000, while that of the railways engaged in our internal commerce was twenty-three times greater or \$4,600,000,000; second, that the then annual foreign trade of the United States was but \$1,121,000,000 in value, while that of our internal commerce transported by railways alone was about sixteen times greater or \$18,000,000,000.

Accepting his estimate as a fair one, and we believe it will bear the closest scrutiny and can be confirmed in a variety of ways, it follows that the present value of the internal commerce of the whole United States is twenty-five times \$1,500,000,000, or thirty-seven and a half billion dollars, a sum considerably more than double the value of the whole world's foreign trade.

Now let us draw another conclusion from this estimate. The Mississippi Valley States are the granary of the Republic, they also supply the chief part of our cotton, pork, and tobacco. In brief they furnish, on an average, fully 75 per cent. of these great staple products. They are underlaid with immense deposits of coal and iron, and their furnaces are aglow in hundreds of manufacturing villages. The products of their industries are as varied as the wants of mankind. They are dotted with large and active commercial cities and towns. It is therefore safe to assert that the value of the annual internal commerce of these twenty-one States and Territories is equal to half that of the whole United States, or upward of \$18,000,000,000.

We repeat, then, and we invite the most searching criticism of the estimate, that the present annual internal commerce of the States and Territories tapped by the navigable portions of the Mississippi and tributaries is in value greater than the total foreign commerce (exports and imports combined) of the whole world.

Mr. Speaker, how shall this vast commerce be transported? Shall the rates be high and burdensome—a cloud upon our industries—or so low as to be an incentive to increased production, and an enlarged material development? Shall the rates be regulated by monopolists in the interest of a few or by the people in their own interest?

The Erie Canal, even when handicapped by tolls, has been able to regulate the transportation rates of the New York Central and other railways from the West to the Atlantic seaboard. The Mississippi and tributaries, which are free to all, stand ready, just as soon as they are placed in an adequate state of repair, to perform a similar but greater service for the people of the whole interior of this great nation.

The stockholders of a railway corporation would consider their agents negligent and incapable if they omitted needed repairs to the road-bed and thereby ruined its business and income. The people who own the great river-ways take a similar view of any neglect of the Mississippi and expect us, their representatives and agents, to keep it in good repair.

THE SAVING IN TRANSPORTATION RATES.

The question now arises, what will the people gain by the improvement and adequate use of this outlet to the sea? We can best appreciate this point by a contrast with railway transportation.

During the three years, 1877, 1878, and 1879, the river rate of transportation from Saint Louis to New Orleans on a bushel of wheat ranged from 7.75 cents to 8.75. During the same period the rates by rail from Saint Louis to New York ranged from 17.75 to 24.06 cents per bushel. The saving in favor of the river route to the seaboard at New Orleans, as will be observed from a comparison of these figures, ranged all the way from 10 to 15 cents per bushel. The present annual production of grain of all kinds in the Mississippi Valley is approximately 2,000,000,000 bushels. In a few years from now the production will be double and the quantity which can be spared for

export alone will be equal to the 2,000,000,000 now produced. Ten per cent. saving on that quantity transported to the seaboard would be \$200,000,000 per annum.

To further illustrate the remarkable superiority of a good navigable river over a railway for the cheap and convenient transportation of the bulky freights of an agricultural country, I quote the following from a commercial editorial in the Saint Louis Republican of April 8, 1881:

There are now three barge lines loading grain and package freight for New Orleans—the grain for foreign export—and the respective tows will depart Saturday, or as soon as the weather will be favorable. The tows and cargoes of grain will be as follows: Steamer Iron Mountain and five barges with 220,000 bushels wheat and 50,000 bushels corn; Oakland and six barges with 50,000 bushels wheat, 200,000 bushels corn, and 25,000 bushels oats; and the Bigley and four barges with 40,000 bushels wheat and 100,000 bushels corn; making a total shipment for the week of 680,000 bushels grain, which, by railway transportation, at 500 bushels to the car, would require 1,370 cars, and estimating twenty cars to the train, would make up sixty-nine freight trains, and employ about four hundred trainmen.

The advantages of water transportation are equally apparent when we consider the immense deposits of coal underlying the valley States. According to Spofford's American Almanac the estimated coal areas of the whole United States are 215,401 square miles, of which 207,466 square miles, or 96 per cent., are in the nineteen States intersected by the Mississippi and its navigable tributaries.

A very pointed illustration of the superiority of water-ways for the transportation of this heavy and bulky freight was given by the Cincinnati Commercial about the beginning of the year 1878, which I will quote:

The tow-boat Josh Williams is on her way to New Orleans with a tow of thirty-two barges, containing six hundred thousand bushels (seventy-six pounds to the bushel) of coal, exclusive of her own fuel, being the largest tow ever taken to New Orleans, or anywhere else in the world.

Her freight-bill, at three cents per bushel, amounts to \$18,000.

It would take eighteen hundred cars, of three hundred and thirty-three bushels to the car, (which is an overload for a car,) to transport this amount of coal.

At \$10 per ton, or \$100 per car, which would be a fair price for the distance by rail, the freight-bill would amount to \$180,000, or \$162,000 more by rail than by river.

The tow will be taken from Pittsburgh to New Orleans in fourteen or fifteen days.

It would require one hundred trains of eighteen cars to the train to transport this one tow of six hundred thousand bushels of coal, and even if it made the usual speed of fast freight lines, it would take one whole summer to put it through by rail.

This statement shows the wonderful superiority of the river over rail facilities.

Remarkable as is this statement, I can add that other shipments of still larger quantity have since been made in one tow, as will be seen by the following telegram and answer:

HOUSE OF REPRESENTATIVES,
Washington, D. C., June 14, 1882.

MESSERS. WOOD & CO., Coal Shippers, New Orleans, La.:

Please telegraph me immediately the largest amount of coal ever brought down the Mississippi River by any one tow.

J. FLOYD KING.

NEW ORLEANS, LA., June 14, 1882.

TO J. FLOYD KING, House of Representatives,
Washington, D. C.:

Six hundred and fifty thousand bushels, equal to 26,000 tons, by tow-boat John A. Wood. B. A. WOOD & BROS.

Cotton and iron ores are some of the many other bulky products of the valley which call for cheap transportation by the improvement of the water-ways. Who, Mr. Speaker, will be benefited by this great work? Not only the producer of the valley but the consumers of the whole country; in other words, the people of the whole United States.

VALUES DESTROYED BY OVERFLOWS.

The destruction by overflow during the last great flood in the Mississippi Valley of crops, buildings, farm improvements, live stock, railway property, telegraph lines, depreciation in value of real estate, loss of credits, and in other ways cannot be less than \$50,000,000. Besides this the effect upon the public health is most deleterious. Shortly following similar inundations in the past have appeared yellow-fever plagues and wide-spread malarial diseases.

I regret that I cannot give an official statement of the pecuniary damage caused by overflows. It would be well for us to provide for a statistical report upon this subject. Two resolutions to that effect are now pending before the Committee on Levees and Improvement of the Mississippi. The report would show an aggregate loss of property truly astounding, all caused by the overflow of a national highway, one over which no power but the Federal Government has any legal control.

FUTURE VALUES IF PROTECTED FROM OVERFLOWS.

There are upward of 26,000,000 acres of land within the delta of the Mississippi, an area as large as the whole State of Ohio and containing a population of about a million and a half souls. This territory, the richest in the known world, is capable of supporting a population ten times its present number. Two-thirds of this area is the most fertile cotton land on the planet and capable of producing on an average a bale of cotton to the acre. The other third can be made to produce with profit a hogshead of sugar to the acre. Supposing this vast area was protected from overflow and two-thirds of it under cultivation, we would have from these lands an annual cotton crop of 11,555,555 bales, worth at present prices \$462,222,000, and a sugar product of 5,777,777 hogsheads, worth at present prices \$462,222,000—upward of \$900,000,000 a year.

The lands themselves would increase in value at least tenfold.

From such increase of production and values there would result new industries, new and enlarged commerce, and increased revenues to the State and General Government. There is probably no other work which the United States can constitutionally support that would be attended with so large pecuniary returns as the improvement of the river and the protection of its delta. The riches of Holland, accumulated since the construction of her dikes, is ample proof of this assertion. In illustration of this point I quote as follows from a work on the Mississippi and Tributaries, by Alex. D. Anderson:

The history of the protection and development of the Netherlands, (low countries,) an exact parallel in formation to the alluvial lands of the Mississippi Valley, proves very clearly that we have not overestimated the importance of the subject.

The United Kingdom of the Netherlands contains but 12,680 square miles, and North and South Holland, two of the eleven subdivisions of the same, but 2,209 square miles. The whole of the Netherlands are made-land, having been formed by protection from the overflow of the Lower Rhine, the Maas, the Scheldt, and other rivers, ninety lakes, and the Zuider Zee. The total cost of their protection by dikes, embankments, and other works, was \$1,500,000,000. The annual cost of guarding, protecting, and repairing is stated to be from \$2,000,000 to \$2,500,000. Probably that country, in proportion to its population, is the wealthiest nation upon the face of the earth. An elaborate review of the same says: "The country is everywhere well peopled, and no population in the world exhibits a more uniform appearance of wealth, comfort, and contentment."

Holland not only has capital enough for home use but the Dutch of Amsterdam are capitalists who have a large surplus to lend for public improvements and large enterprises in other nations. Yet all the wealth of this rich and commercially powerful kingdom was accumulated in an alluvial country having an area less than one-third that of the alluvial lands along the Lower Mississippi.

We will profit by their example if we protect our own lands from overflow—lands which are equally productive and far more easily and cheaply protected.

THE EFFECT OF OVERFLOWS ON SOCIETY AND GOVERNMENT.

The floods not only sweep away property and values but undermine the very foundations of society and government. Schools are suspended, churches unattended, lines of travel and intercommunication broken, civil processes cease, courts are closed, mails suspended, taxes uncollected, in brief, the functions of government are paralyzed. The people are driven to the roofs of their houses and upon fragments of broken levees, and reduced to starvation, sickness, and death. Can this great and powerful Government contemplate such a spectacle within its own borders, among its own people, without at once adopting methods of relief and supporting those methods by every means in its control?

THE REMEDY.

We have next to inquire what is the remedy. In 1879 Congress delegated this whole question to a board of skilled engineers, called the Mississippi River commission. They were instructed as follows:

It shall be the duty of said commission to take into consideration and mature such plan or plans and estimates as will correct, permanently locate, and deepen the channel and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof; prevent destructive floods; promote and facilitate commerce, trade, and the postal service; and when so prepared and matured, to submit to the Secretary of War a full and detailed report of their proceedings and actions, and of such plans, with estimates of the cost thereof, for the purposes aforesaid, to be by him transmitted to Congress: *Provided*, That the commission shall report in full upon the practicability, feasibility, and probable cost of the various plans known as the jetty system, the levee system, and the outlet system, as well as upon such others as they deem necessary.

In their first report to Congress, in the spring of 1880, the commission announce their general conclusion or plan for improvement of navigation in the following language:

The work to be done, therefore, is to scour out and maintain a channel through the shoals and bars existing in those portions of the river where the width is excessive, and to build up new banks and develop new shore-lines, so as to establish as far as practicable the requisite conditions of uniform velocity for all stages of the river.

This is substantially an adoption and extension of the jetty system already in successful operation at the mouth of the river. To accomplish the other objects enumerated in the organic act they reported in favor of levees:

It is obvious that levees are, upon a large portion of the river, essential to prevent destruction to life and property by overflow. They give safety and ease to navigation and promote and facilitate commerce and trade by establishing banks or landing places above the reach of floods, upon which produce can be placed while awaiting shipment, and where steamboats and other river craft can land in times of high water.

In a restricted sense, as auxiliary to a plan of channel improvement only, the construction and maintenance of a levee system is not demanded. But in a larger sense, as embracing not only beneficial effects upon the channel but as a protection against destructive floods, a levee system is essential; and such system also promotes and facilitates commerce, trade, and the postal service.

A levee system aids and facilitates the postal service by protecting from injury and destruction by freshets and floods the various common roads and railways upon which that service is conducted to and from the river bank, and generally within that portion of the alluvial region subject to overflow. Moreover, the permanent maintenance below Cairo of a connected levee system, a system of sufficient strength to inspire confidence in its efficiency, or the demonstration, by the achieved results of an improved river, that overflow need no longer be seriously apprehended, would act as a prompt and powerful stimulant in rapidly developing a largely increased trade and commerce in all the products of agricultural industry indigenous to that region, and in those branches of manufacturing enterprise related thereto.

The general plan of improvement adapted to cover each object prescribed is, then, a combination of jetties and levees. Actually, I may say, a system of levees, for jetties are but levees, built in the river. The outlet theory was reviewed by the commission and discarded in the following language:

As the system of improvement proposed by the commission is based upon a conservation of the flood waters of the river, and their concentration into one channel of an approximately uniform width, it would seem scarcely necessary further to consider a system based upon theories and arguments so diametrically opposed to it as the outlet system is thus shown to be.

At the opening of the present Congress another report of the commission was submitted, and came before two committees of the House for consideration—the Committee on Levees and Improvement of the Mississippi River, and the Committee on Commerce, which has the subject of river and harbor improvement under its control. It was promptly shown before these committees by testimony of members of the commission and others that for both the protection of these valley States from the overflow and for the improvement of the river, to give ease and safety to commerce and also protect and promote the postal service, levees are essential. Let us briefly review the testimony on this point; and first, that before the Committee on Levees and Improvement of the Mississippi. Captain Eads, of the commission, said:

I believe that this will be the result of the works of improvement projected by the Mississippi commission: that a beneficial condition of affairs for navigation and for agriculture will result so much quicker to the country if we close these gaps in the levees and get all of the force of the river to help this good work. I do not think that \$2,000,000 can be better employed than in having these gaps closed. That work can be done without any interference whatever with the work of the commission. If Congress will authorize the closure of them by the Secretary of War he can have the work contracted for, and it can go on without interrupting at all any of those works of improvement which the commission have recommended, and it will bring the deep channel so much the quicker.

Major Harrod, of the commission, in reply to interrogatories, testified as follows:

Mr. HARROD. The conclusion, I believe, from the observations made in Europe covering the last two hundred years, is that the progress of clearing and occupying the adjoining country does deteriorate rivers in perhaps three ways: by making floods more rapid and excessive and disturbing; by decreasing the low-water discharge; and by filling up the river bed, owing to the greater quantity of sand and gravel carried down.

Mr. JONES. And the only way such influences can be counteracted on the Mississippi, in your judgment, is by building levees—the only salvation for that country is to hold the water between banks and force it to scour a way for itself down to the ocean?

Mr. HARROD. Yes, sir; that is my opinion.

He also quoted from a report on levees and outlets by a sub-committee of the commission, which sub-committee was composed of Messrs Harrod and Suter:

We beg leave to submit the following conclusions:

1. That bayous and overflows afford no permanent or uniform relief, but produce changes of regimen detrimental to navigation, and cause destructive floods.
2. That the direct influence of a levee system is to improve navigation and prevent destructive floods by the establishment of a regimen, and the elimination of varying and abnormal local conditions.
3. That the conservation of flood waters by artificial embankments is becoming of greater importance every year, both in preserving navigation and in preventing destructive floods from the recession of the banks to lower levels, and has already, in many parts of the river, become essential.
4. That the act under which we serve contemplates the preparation by this commission of a complete plan for the regulation of the river and its banks. Any such plan must include the control and uniform maintenance of such conditions of the river banks as are consistent with the principles controlling the works already recommended by us. The present provision for such maintenance, by the States and riparian owners, is inadequate and hazardous.

He further testified before the committee as follows:

Mr. KING. I see reference made in this report to low-water navigation in the river, which is spoken of, seemingly, as the main subject to be attended to. In the law appointing the commission I find this provision: "It shall be the duty of said commission to take into consideration and mature such plan or plans and estimates as will correct, permanently locate, and deepen the channel and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof, prevent destructive floods, promote and facilitate trade, commerce, and the postal service." Was your attention drawn specially to low-water navigation by anything in the law?

Mr. HARROD. No, sir; and we have always intended our plans to be what we call high-water plans. We expect, in narrowing the channel, to continue our work until the contraction shall have extended to high-water mark. We consider that no low-water plan could have any effect in attaining a number of the objects that are mentioned in the organic act, and we have regarded our plans as high-water ones.

Mr. KING. You were at one time chief of engineers of the Louisiana State board of engineers on levees?

Mr. HARROD. Yes, sir; for some years.

Mr. KING. In the course of your study of the general subject of levees, have you observed any necessity for levees as a means of giving safety and ease to navigation during seasons of flood?

Mr. HARROD. Yes, sir; that subject has been presented to us. Levees do give such ease and safety, but probably the extreme cases are presented by this recent flood. I am informed that almost all the light-houses upon the river are swept away. I am also informed that the Memphis Anchor Line of boats (a very large line, as some of you gentlemen know) were withdrawn from the trade two or three weeks ago, because they could not make their landings, and the majority of the railroads that extend from the river westward are under water. There are one or two, I think, in the Saint Francis bottom. The road from Arkansas City west is under water and stopped running some time ago; the road from Vicksburg west is about four feet under water. The Baton Rouge road, a local road, has ceased running, and I have very little doubt from the news in the papers this morning of the breaking of the La Fourche and Point Coupé crevasses that Morgan's Louisiana and Texas Road, which is a Pacific road, will go under water.

Particular attention is called to this last quotation as showing the necessity for levees for high-water navigation.

Lieutenant-Colonel Comstock, of the commission, answered as follows:

Mr. JONES. Therefore the only permanent relief, you think, is to be obtained by confining the waters, and so cutting a channel down to the sea which will afford a sufficient outlet for the water? All other reliefs would be temporary, and would be like doctoring the symptoms instead of attacking the disease, wouldn't they?

Lieutenant-Colonel Comstock. If you are speaking of overflows, I think the only permanent relief is to make big levees.

Mr. JONES. So as to confine the water and compel it to cut itself a channel out to the ocean instead of spreading over the country?

Lieutenant-Colonel Comstock. Yes.

Mr. MOORE. In connection with your jetty or levee plan would or would not two or three outlets wisely located to take off the surplus water tend to improve the navigation?

Lieutenant-Colonel Comstock. No, sir; I do not think you can ever improve the navigation in that way.

Professor Mitchell, of the commission, said:

I am just fresh from a little study of the Delaware, which is a minute stream compared with the Mississippi, but which has all the characteristics of the larger river. Some portions of the Delaware have been leveed for a hundred years, and, as far as I can observe, the response of the river to the process proposed by the Mississippi River commission has been prompt and satisfactory, and excellent results have come from a systematic procedure upon substantially the principles and the method proposed by the commission. The stream has been leveed, then it has had its shores occupied by wharves and other structures, and the bottom has given way just about so fast. The Delaware is a stream which is subject to floods. I have not the figures to show the size or extent of those floods, but, so far as I know, they have not increased. The bottom has given way about as rapidly as the shores have been raised, so that the stream is in as good condition now as it ever was in respect to floods, and in a great deal better condition as to navigation, having twelve or fifteen feet more water.

Mr. DARRALL. What kind of material has been used in the construction of the levees on the Delaware?

Mr. MITCHELL. Substantially the same as on the Mississippi—heaps of sand or earth.

Captain Leathers, an experienced navigator on the Mississippi, said:

Mr. KING. Do crevasses injure navigation?

Mr. LEATHERS. They are a great injury to it.

Mr. KING. Have you ever been drawn into a crevasse?

Mr. LEATHERS. Partially, but not altogether.

Mr. KING. Did you ever know of any steamboat being drawn into a crevasse?

Mr. LEATHERS. Yes; the Katie was drawn in at Bonnet Carré in 1874.

Mr. KING. I want to know the effects of a crevasse in that portion of the river which is generally so shallow as to excite your observation.

Mr. LEATHERS. Let me answer your question by the report of the engineers who were stationed at Vicksburg in 1844. They were down there surveying and taking the drift and current of the river. There was a break of the levee at Point Lookout, another just below Providence, and a tremendous break in the levee at Harris's. When the levee at Point Lookout broke, the impression was that we would have a big fall of water, which would relieve the planters below. The water did fall instantly; it fell about six inches at Vicksburg, but it gained that back. When this crevasse broke, the current at Vicksburg was upward of six miles an hour. It broke at Duckport, at Goodrich's, at Young's Point, at New Carthage, Point Pleasant; in fact, it broke all along, and the river kept getting up. The river was sluggish, and kept growing more sluggish. The waters were then from the Mississippi Hills to the Mason Hills, and steamboat men hardly knew (except from the timber) where the lands were, in a great many instances.

Mr. KING. That endangered navigation?

Mr. LEATHERS. It endangered navigation. At those times, as a matter of course, there is the most deposit at the bottom. If the water could be kept within its banks there would be no trouble about navigation. You may find one or two places below Cairo where the river may want to divide in time of low water; and it will be a mere bagatelle then to make a brush-dam to concentrate it into one, and whenever the river is united together there is no scarcity of water below Cairo.

Captain Duple, a steamboat captain upon the Mississippi River, said in reply:

Mr. KING. You have been navigating the Mississippi River for a great many years?

Mr. DUBLE. Yes; a great many years.

Mr. KING. Did you ever notice the effect upon navigation produced by crevasses at flood time? Did you ever hear of boats being drawn into crevasses?

Mr. DUBLE. Yes.

The testimony of these experienced navigators of the Mississippi proves that the navigation of the river at flood season is dangerous. It can be improved materially only by a regular system of levees.

In the testimony taken before the Committee on Commerce General Gilmore, president of the commission, said:

The volume of flow, and therefore the velocity and the scouring power in the bed of the stream, are all increased by levees during periods of overflow. More-over levees are, upon a very large portion of the Mississippi River, absolutely necessary to prevent widespread destruction to life and property by overflow, and any one who has witnessed the sublime spectacle of such a flood as now prevails throughout the entire valley of the Mississippi, submerging the banks to a depth of many feet and spreading out over the entire alluvial section to widths varying from forty to sixty miles, cannot avoid the conclusion that an adequate system of carefully maintained levees is required to make navigation reasonably safe and easy and to render the carrying on of trade, commerce, and the postal service possible, in the sense of ordinary economic feasibility. I believe the fallacy that levees will cause a permanent raising of the flood surface has been abandoned by all who formerly entertained it.

Mr. GIBSON. Are the parts of your plan, namely, the improvement of the reaches and the re-establishment of the banks by levees, so closely connected as to be independent, the one operating in low water the other operating in high water, and both contributing to channel improvement?

General GILMORE. Certainly.

Mr. GIBSON. Both essential, therefore, to the general scheme which you have explained to the committee?

General GILMORE. Exactly; but in my judgment levees built specially for channel improvement might be better located than they generally are. You cut across necks and points of land in building a levee to prevent overflow, whereas if you were building it merely for the purpose of improving the channel you would follow the bends. But even as they are located, the levees are an essential part of the system of improvement that we have projected.

General Humphreys, of the Army Engineers, whose name is inseparably connected with the Mississippi as one of the authors of that great work entitled Humphreys and Abbot's Hydraulics of the Mississippi, testified with great emphasis, as follows:

The CHAIRMAN, (Mr. TOWNSEND, of Ohio, in the chair.) Please ask General Humphreys first, whether a system of levees is absolutely necessary for the improvement of the navigation, without regard to the prevention of overflows?

Mr. McLANE. Very well; I will ask him to state whether in his opinion a sys-

tern of levees, with or without outlets, is not indispensable for the improvement of the river from the mouth of the Ohio down!

General HUMPHREYS. Yes, sir; certainly.

Mr. REAGAN. In determining, as you did, the necessity of extending the levees from the mouth of the Ohio to the mouth of the Mississippi, did you consider whether it was practicable or possible to retain the floods of the Mississippi River within those levees?

General HUMPHREYS. Yes; that was the question. The object of constructing levees and raising them to certain heights was to confine the river within them, otherwise it would be a useless expenditure of money. The great object of making these measurements was to determine the question how high the river would rise if all the water were kept within its channel, and the observations were made because no one had any means of answering that question before.

Mr. HORR. And did you conclude that it could be done?

General HUMPHREYS. Yes, sir.

In a speech delivered in the House in June, 1878, Hon. E. W. ROBERTSON introduced testimony to the same effect, as follows:

As regards the effect of closing the outlets and repairing the levees, I desire to read the opinions of two steamboat captains of many years' experience and practical observation on the Mississippi. No more reliable or competent authorities can be cited on this subject. Captain Leathers, in a letter addressed to me a few weeks ago, says: "I came on the river in 1836. The river was very low that year. The average depth of water on the shoalest bars from the mouth of the Ohio to the mouth of the Arkansas, a distance of about four hundred and fifty miles, was about four feet. From mouth of Arkansas to mouth of Yazoo, about two hundred and twenty-five miles, there was about five feet. From that to the mouth of Red River, about the same distance, the average depth on the shoalest bars was seven feet. Below Red River levees had been built, I do not know how long, but thence to the Gulf there was deep water.

"Then levees began to be built above Red River in the parishes of Concordia, Tensas, Madison, and Carroll, the result of which was that in 1857, a period of twenty-one years, while the river was twenty inches lower in its banks there was not less than eight and a half feet of water on the shoalest bars in the formerly unleveed district between the Red and Arkansas Rivers, showing an increased depth of four feet scoured out by the current created by concentration of the water.

"I am convinced from my observations that if the levees were rebuilt and kept up on the low lands, the concentration of volume, and consequent accelerated current, would soon wash out a channel large and deep enough for any purposes of commercial navigation. I am thoroughly satisfied that in the last ten years the frequent breaks in the levees and crevasses, dispersing the waters over the country and diminishing the current, have caused the river to begin to shoal again. It always shoals near these breaks, evidently in consequence of the slackened current and natural deposit of sediment on the bottom which follows.

"I am confident that the only way of deepening the channel and getting reliable navigation is to concentrate the current, and if the great river accommodates itself by scouring out the bottom, there will be no necessity for higher barriers at the top, and the levees will become more solid and reliable because relieved in a measure from the great pressure to which they are subjected."

The other authority, Captain Aiken, who is president of the New Orleans and Red River Transportation Company, says in a recent communication to me as follows:

"Red River, from Shreveport, Louisiana, to its mouth, distance about five hundred miles, was, previous to the building of levees along its banks, a shoal stream, having a rise and fall of from eight to twelve feet, overflowing its banks during every high water and inundating the country for miles on either side. As the country became settled, the planters built levees to protect their lands from the annual overflows. At about the year 1860 these levees, from Loggy Bayou to Alexandria, distance two hundred and twenty miles, had become connected and continuous, presenting an unbroken line on each bank. It was soon found that the concentration of the water and increased current caused by the levees was washing out and lowering the bed of the river, and the effect has been so great that along this section of the river the rise and fall is now as much as twenty-five to thirty feet, and the lands have not been inundated for years. There are levees standing to-day four feet high above their base, that the highest floods have not touched for years. Since the war the levees have been extended above Loggy Bayou to Robinson's, distance about twelve miles, and the same deepening or lowering of the river bed has been the result.

"From Robinson's to Shreveport, distance about ninety miles, there are outlets on either side; the levees are not continuous and connected as they were below; the lands still overflow and the river is gradually shoaling. Below Alexandria the river is in about the same condition as when first navigated by steamboats, namely, no perfect system of levees, no lowering of its bed; open outlets and annual overflows.

"Red River runs its entire course below Shreveport through alluvial soil similar in all respects to that of the Mississippi. There can be no disputing the facts as to the Red River levees having lowered the river bed and deepened the channels as above described. There are thousands of people living on its banks to testify to the truth of this statement, and as the Mississippi and Red Rivers are similar in all respects, except as to the volume of their waters, it seems reasonable to expect that a perfect system of levees on the Mississippi would deepen that river and improve its navigation. In fact, it is known to old Mississippi steamboat men that the permanent depth of water on the shoalest bars had been increased by several feet along the sections of that river that had been leveed, and that since the breaking of the levees this deepening process has ceased. It is also known to them that bars form opposite and the river shoals below any permanent break or crevasse in a levee.

"As to the effect of jetties on river bars we state that Snaggy Point bar, on Red River, seventy-five miles above its mouth, and Alexandria bar, three miles below the town of that name, had always, until recently, been almost impassable obstructions to boats in low water, seldom in these seasons having depths over them of more than fifteen to twenty-four inches. During the low water seasons of 1876 the New Orleans and Red River Transportation Company placed jetties made of willow mattresses on Snaggy, and in less than fifty hours the depth of channel had increased from twenty inches to five and a half feet. After the high water of the following year had subsided, the jetties were found intact and the channel so deep and well defined that not a single boat had a moment's detention at that place throughout the entire season, (fall of 1877,) which was one of unusual low water. During the fall of 1877 this same company placed jetties on Alexandria bar when there was but sixteen inches water and boats had after putting off all cargo found it impossible to pull over. The channel immediately deepened, and although the river continued to fall for several weeks afterward there was at no time throughout the season less than four and a half to five feet water. Freight charges by the boats were lowered one-third at once in consequence of this improvement."

But stronger than all the above indorsements of levees is the recent minority report of Captain Eads who thought the last report of the commissioner was not sufficiently emphatic on this point, and who wished to add to what he himself had previously said in their favor. I quote as follows from his clear and convincing statement:

My views regarding the important agency of the levees in improving the low-water channel of the Mississippi were not expressed in that report with the degree

of emphasis which I then desired, and I am unwilling to commit myself now to any expression in the present report, which, in the slightest degree, tends to throw a doubt upon the necessity of, or to justify any further delay in the closing of these outlets. On the contrary, I deem it proper to urge with redoubled force the absolute necessity of their immediate closure.

From quotations hereinafter made from the previous report of the commission, it will be seen that it relies upon the increased volume of discharge for scouring more deeply the bed of the river and lowering its floods. The loss of its volume through outlets or crevasses is fully recognized in that report, as the cause of the deposition of sedimentary matters in the bed of the river, by which its flood surface is raised from year to year.

Observations made by the commission plainly show that the effect of the present gaps in the levees has been to raise the flood-line of the river many inches above any heights previously attained within the seven hundred miles in which they exist most numerous, between Natchez and the mouth of the Ohio River. Within this distance there have occurred during the last eighteen years innumerable crevasses, aggregating, in 1875, a length of about one hundred miles, and throughout this part of the river the deposits have raised its bed so much as to greatly injure navigation, and to cause smaller floods to rise to heights never before attained.

This question is of such vast importance, and in view of my dissenting from the report of the commission, I trust that I will be pardoned for explaining at some length the general principles underlying the plan of improvement recommended by the commission, and the relation which the levees have to that plan. It should be borne in mind that this plan is only applicable to the rectification of a sediment-bearing river, and not to rivers flowing through rocky beds, and whose waters are clear. It should be especially noted, also, that this plan, when fully executed, will render the further use of levees almost, if not entirely, unnecessary. A more ready understanding of the principles upon which it is based will be had by first briefly describing the formation of the lower or main alluvial basin of the river.

This basin extends from Commerce, Missouri, (a few miles above the mouth of the Ohio,) to the Gulf of Mexico, and has an average width of about sixty miles. Its length is about six hundred miles in a direct line, and it contains about thirty-four thousand square miles, or an area equal to that of the State of Indiana. At the upper end of the basin a spur of the Ozark Mountains has been cut through by the river at the town of Commerce, and through this, over a rocky bottom, six or eight miles in length, the Mississippi now flows. Forty miles above Cairo, on the Ohio River, the same spur has been cut through by that tributary. Throughout this entire basin, bounded by highlands on each side, we have every reason to believe that an estuary of the Gulf of Mexico once existed similar to the Gulf of Saint Lawrence; or to the Rio de la Plata, which is now being filled and built up by the immense mass of deposits annually poured into it by the Parana and Paragua rivers. The floods of the Mississippi River, being highly charged with sedimentary matter, have filled this ancient and extensive estuary with alluvial deposits to the height of about three hundred feet above the sea at the upper end of the basin. The surface of the land thus made by the river has a comparatively regular descent from the upper end of the basin to the Gulf, being at Gaines's Landing, midway to the Gulf, about one hundred and forty feet above the sea. Through these deposits the river winds its tortuous course in a channel about one thousand one hundred and fifty miles long.

Experience and observation prove most conclusively that the quantity of solid matter which the water of the river is able to hold in suspension is strictly regulated by the velocity of the current. Therefore, during the natural process of this land formation, whenever the flood waters escaped over the banks of the channel, the loss of current in the water thus escaping caused the sandy or heavier portions of the solid matter held in suspension in it to settle almost immediately on the submerged banks; while the argillaceous and lighter portions, which take longer to settle, were carried back by the feeble current to the swamps or lower lands, on which they were deposited over a much more extensive area. These lighter matters now constitute the blue and other colored clay strata which are found in all parts and at all depths of the basin. The river banks were thus kept constantly higher than the lands more distant from the stream. Before any levees were built on them they were usually from ten to fifteen feet higher than the lands one or two thousand yards distant from the river.

The size of the flowing volume of any river constitutes, as will be seen hereafter, a very important element in determining the velocity of its current, and as the loss of volume over the natural banks has the effect of producing a more sluggish current in the main channel, a deposition of sediment resulted wherever this loss occurred.

In this manner the bed of the stream, during each successive flood, was built up higher and higher, while the water escaping over the banks built them up also. Thus the river and its banks were both gradually elevated above the neighboring lands until some important breach occurred in one or the other bank, and caused the river to seek a new channel through or over the lower lands. Illustrations of this process are frequently occurring at this time in the lower part of the basin. Sixty miles above the mouth of the river its flood surface is now seven or eight feet higher than the mean level of the Gulf, and through this sixty miles it flows to the sea between narrow banks that have been elevated by repeated overflows above the sea-level. From time to time the river has broken through these narrow embankments and found a steeper and shorter route to the salt water.

Through such new route its heavily laden waters bear immense quantities of sediment, which is deposited in the Gulf at the mouth of the outlet, because the current can carry it no farther. About thirty-five miles above the mouth one of these outlets, known as "The Jump," occurred about forty years ago. It has already formed over a hundred square miles of territory upon which rice plantations exist, and on which trees are growing larger than a man's body. From six thousand acres of this land, purchased from the State of Louisiana, were obtained nearly all of the willows used in the construction of the jetties. The gradual enlargement of this sub-delta has so lengthened the outlet and flattened the surface slope of its branching channels that the current from the river through them, even in flood time, is now too sluggish to carry the heavy sedimentary matters of the main river by that route to the sea, and hence this outlet is gradually closing up. When it first occurred the water in it was one hundred feet deep; now it is scarcely four or five.

During this land-building process of the river outlets were doubtless formed, from time to time, throughout the entire six hundred miles of the basin, in a similar manner to the one described at "The Jump." Occasionally the conditions were such as to cause the entire stream to forsake its old channel, and in this way it was enabled to distribute its deposits throughout the whole width of the basin from bluff to bluff. Cut-offs and crevasses facilitated this distribution, and the elevation of the bed and the banks of the stream gave it the ability to maintain a sufficient height above the adjacent lands to send its earthy matters many miles away from its channel, while the unstable character of its banks enables it to change its location from time to time, and thus to cover every part of the basin with its deposits.

Levees stop this land-building process, because they restrain the floods within the defined channel of the river, and so long as they are intact it is impossible for the banks or the bed of the river to be built up to greater heights by the natural process just described. It is an error completely, and often disproved, but still repeatedly advanced by misinformed persons, that rivers confined between levees have a tendency to have their beds elevated, and, as a consequence, to need a corresponding elevation of the levees. The Po and the Rhine and other rivers in Europe effectually disprove such assertions. Their channels have been deepened and their floods lowered as a consequence of perfect levees, and this it will be

presently seen, is an inevitable result of the laws which control the phenomena of sedimentary streams, wherever they flow in channels made through their own deposits.

The methods by which the desired results are to be accomplished have, then, been fully investigated by the commission. Even before the creation of that honorable and distinguished body of men, renowned for their learning and fidelity to all the highest principles which govern mankind, the genius of Eads discovered and mastered the laws governing that great stream when he solved the problem of giving a deep-water channel to the sea by jetties at its mouth.

The testimony which we have above cited establishes conclusively two points, namely, that levees are absolutely requisite for the protection of this vast section of country from destructive floods and are at the same time essential to the improvement of navigation.

The organic act is explicit in its instructions to the commission, and the commission are explicit in their report as to the necessity of levees to accomplish each of these objects. Nevertheless, the gaps in the levees have not been closed, and a new and terrible flood has been permitted to sweep through these openings, carrying destruction and death in its path. Why this fearful blunder which, in its results, is equivalent to a crime? Who is responsible for it? I reply, hasty and unwise legislation a year ago in adding a proviso to the appropriation for the Mississippi prohibiting its use for purposes of protection.

It was then thought by the friends of river improvement that the proviso would be differently construed by the commission; but in this they were mistaken, as may be seen from the testimony of General Gilmore, president of the commission, before the Committee on Commerce. I quote as follows:

Mr. McLANE. Please explain to the committee in what respect the language of the appropriation bill of last year embarrassed or restrained the commission in the improvement of the levees.

General GILMORE. It did not embarrass me; but it embarrassed enough members of the commission to render it nugatory.

Mr. McLANE. It was not supposed or intended that that phraseology would embarrass the commission at all in the improvement of the river. The object was to exclude the construction of levees that had no connection with the improvement of the river. There was some opposition in Congress and in the committee to a scheme of levee improvement independent of the improvement of the navigation, but this language was not intended to embarrass you in constructing levees that were incident to the improvement of the navigation.

Mr. GIBSON. The language of the law is, "No portion of the appropriation hereby made shall be expended for building levees, unless it be for channel improvement."

General GILMORE. The members of the commission were not in entire accord in the interpretation that they put upon that phraseology.

Mr. McLANE. I understand very well that the law confines you to such improvement of levees as is incident to the improvement of the navigation of the river, and if there was any difficulty on that point in the way of the commission it ought to be removed.

General GILMORE. Well, there was just enough difficulty put in our way by that phraseology to influence a majority of the members of the commission and render them unwilling to touch the levee question with that phraseology in the law. In fact they were not very much in favor of levees anyhow, and they felt embarrassed by that provision. That is all.

Mr. McLANE. When I asked you a little while ago if the recent developments would modify or change your estimates of the amount of money that would be required for the improvement of the levees, you replied that it might do so to the extent of fully one-half. Now, looking at these present floods and their effect upon the levees, please state whether the entire improvement of the river is not liable to be modified by such occurrences—in other words, whether not only must the amount of money that is to be expended this year be increased but whether these floods have not developed a necessity for further improvement of the levees in connection with the improvement of the navigation?

General GILMORE. I certainly think so.

Mr. McLANE. I am asking these questions for my own enlightenment. I am of that opinion myself, and I do not think there ought to be any restraint put on the commission as to the expenditure of money on levees. I never did think so, and I think so still less to-day, and I want your opinion fully on that point.

Mr. TOWNSEND, (in the chair.) I understand that this improvement in the levees is only incidental to the improvement of the navigation of the river.

General GILMORE. The appropriation bill, if you recollect, rather restricted the use of the money.

Mr. HERR. Yes; some of our people are afraid that if you make a levee you will benefit somebody.

The result of this bad legislation was the inundation of the whole delta, an area greater than the State of Ohio, the destruction of life and health, the obliteration of post-roads and telegraph lines, the destruction of railroads, the drowning of live-stock, the sweeping away of buildings, fences, and farm improvements, the destruction of both stored and prospective crops, an interruption and destruction of commerce, a loss of credits, an interruption of courts, a barrier to the collection of taxes; in brief, a suspension of the functions of government, both local and national, the pecuniary loss of all which cannot be less than \$50,000,000. And yet, Mr. Speaker, in face of this array of facts known the world over, it is proposed to repeat the foolish and, I may justly add, barbarous legislation by another restrictive proviso tacked on to the appropriation bill now under consideration.

Mr. Speaker, I enter a most emphatic protest against such injustice, such neglect of the fundamental objects of government; yes, such inhuman legislation.

The hands of the States are tied, as you are well aware. They cannot under the terms of the Federal Constitution enter into any treaty, alliance, or confederation among themselves. And without this power and co-operation Louisiana cannot protect itself from the floods sweeping down from Arkansas; Arkansas cannot protect itself from the floods of Southeast Missouri; Louisiana west of the river cannot protect itself from the floods of the State of Mississippi, and

Mississippi cannot protect itself from the waters from Western Tennessee. Nor can the States exercise admiralty or maritime jurisdiction over the great river. The Federal Government says, "Keep hands off; this is a national highway, a Government postal route, a line of interstate commerce." The States cannot dam or bridge it, divert its course, destroy its channel, or meddle with its navigation. But there is one thing the advocates of provisos say we can do: welcome the destructive floods from the many States north, east, and west to our farms, homes, and firesides, and continue at the same time the prompt payment of Federal taxes.

Mr. Speaker, we of the lower valley are tired of such trifling, such disregard of the material and vital interest of several great States. We have ourselves spent upward of \$100,000,000 in building 2,200 miles of levees to protect us from the overflows and ravages of a national river. We might spend the same sum again, but it would not protect us without concert of action between the seven States interested—a uniform plan, a uniform law, and one jurisdiction. All this the Federal Constitution and laws deny us.

Of the total mileage of levees, about two hundred miles are broken. Some of these gaps are at the intersection of State lines. Their repair is clearly an interstate matter. Congress is given by the Constitution power to legislate on the subject of interstate commerce, to build and protect post-roads, to provide for the common defense and general welfare. It is, then, in the power of Congress, as well as its duty, to protect our citizens dwelling in the vast section of country bordered by the banks of the river from overflow.

On this point I will quote from the statesmanlike and patriotic words of the President in his special message under date of April 17, 1882:

The subject is one of such importance that I deem it proper to recommend early and favorable consideration of the recommendations of the commission. Having possession of, and jurisdiction over the river, Congress, with a view of improving its navigation and protecting the people of the valley from floods, has for years caused surveys of the river to be made, for the purpose of acquiring knowledge of the laws that control it, and of its phenomena. By act approved June 28, 1879, the Mississippi River commission was created, composed of able engineers. Section 4 of the act provides that "it shall be the duty of said commission to take into consideration and mature such plan or plans and estimates as will correct, permanently locate, and deepen the channel, and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof; prevent destructive floods; promote and facilitate commerce, trade, and the postal service."

The constitutionality of a law making appropriations in aid of these objects cannot be questioned. While the report of the commission submitted and the plans proposed for the river's improvement seem justified as well on scientific principles as by experience and the approval of the people most interested, I desire to leave it to the judgment of Congress to decide upon the best plan for the permanent and complete improvement of the navigation of the river and for the protection of the valley.

The immense losses and widespread suffering of the people dwelling near the river induce me to urge upon Congress the propriety of not only making an appropriation to close the gaps in the levees occasioned by the recent floods, as recommended by the commission, but that Congress should inaugurate measures for the permanent improvement of the navigation of the river and security of the valley. It may be that such a system of improvement would as it progressed require the appropriation of twenty or thirty millions of dollars. Even such an expenditure, extending as it must over several years, cannot be regarded as extravagant in view of the immense interest involved. The safe and convenient navigation of the Mississippi is a matter of concern to all sections of the country, but to the Northwest, with its immense harvests, needing cheap transportation to the sea, and to the inhabitants of the river valley, whose lives and property depend upon the proper construction of the safeguards which protect them from the floods, it is of vital importance that a well-matured and comprehensive plan for improvement should be put into operation with as little delay as possible. The cotton product of the region subject to the devastating floods is a source of wealth to the nation and of great importance to keeping the balances of trade in our favor.

It may not be inopportune to mention that this Government has imposed and collected some seventy millions of dollars by a tax on cotton, in the production of which the population of the Lower Mississippi is largely engaged, and it does not seem inequitable to return a portion of this tax to those who contributed it, particularly as such an action will also result in an important gain to the country at large, and especially so to the great and rich States of the Northwest and the Mississippi Valley.

These floods are more terrible than invading armies. They cannot be resisted by the States. They overflow cities and villages; they spread over a territory greater in extent than the New England States; their searching waters penetrate the remotest parts, carrying destruction to human industry, death to every form of domestic life, and desolation into every home.

We therefore ask, and in justice to ourselves demand, that the General Government give us this protection to which we feel we are in every way justly and lawfully entitled.

After a careful study of all the reports, and all the observations and testimony on the subject of non-tidal rivers, the conclusion is reached that a marked distinction is to be made between a clear-water stream and a stream bearing sediment or sand in its current. When in the former outlets may be successfully made, as in the case of clear-water canals, to take off the floods, the latter fills up below an outlet by dropping its sediment in the channel in consequence of the lessening of the current, and thereby practically builds up bars or dams for great distances across the entire bed of the stream. Thus the navigation of the river is destroyed, and the flood wave on reaching these river-made dams mount up above the banks and overflow the country.

This, Mr. Speaker, of itself proves the necessity of levees for the improvement of the navigation and the prevention of desolating overflows. Here we find the sister interests of agriculture and commerce side by side, hand in hand; the measures proposed for the promotion of one protect the other. Happy union! It only remains

for the wisdom and patriotism of Congress to act, that from every hamlet, every cottage in this vast and now grief-stricken section may come the paeans of a joyous people made prosperous and contented by the shielding hand of a great and munificent mother Government.

APPENDIX A.

[Minority report of Mississippi River commission, by James B. Eads, April, 1882.]

WASHINGTON, D. C., April 12, 1882.

SIR: I feel compelled to withhold my signature from the last annual report of the Mississippi River commission, as I differ with the views expressed therein on the following important points:

LEVEES.

In the report the following paragraph occurs:

"It is considered by all that levees, by confining the flood waters of the river within a comparatively restricted space, do tend in some degree to increase the scouring and deepening power of the current. But the extent and potency of their influence in the improvement of the low-water channel, in respect to which, for the purpose of navigation merely, improvement is most needed, and their value for that purpose, as compared with other methods of improvement, and as compared with their cost, are regarded as subjects requiring further observation and study, and the accumulation of further and more comprehensive data, before final conclusions can be reached concerning them."

The effect of this paragraph is to weaken the recommendation made by the commission in its report of February, 1880, with regard to the importance of closing the gaps in the levees. The report of 1880 states that—

"The views of the several members, however, are not in entire accord with respect to the degree of importance which should be attached to the concentration of flood waters by levees as a factor in the plan of improvement of low-water navigation which has received the unanimous preference of the commission."

My views regarding the important agency of the levees in improving the low-water channel of the Mississippi were not expressed in that report with the degree of emphasis which I then desired, and I am unwilling to commit myself now to any expression in the present report, which, in the slightest degree, tends to throw a doubt upon the necessity of or to justify any further delay in the closing of these outlets. On the contrary, I deem it proper to urge with redoubled force the absolute necessity of their immediate closure.

From quotations hereinafter made from the previous report of the commission, it will be seen that it relies upon the increased volume of discharge for scouring more deeply the bed of the river and lowering its floods. The loss of its volume through outlets or crevasses is fully recognized in that report, as the cause of the deposition of sedimentary matters in the bed of the river, by which its flood surface is raised from year to year.

Observations made by the commission plainly show that the effect of the present gaps in the levees has been to raise the flood-line of the river many inches above any heights previously attained within the seven hundred miles in which they exist most numerously, between Natchez and the mouth of the Ohio River. Within this distance there have occurred during the last eighteen years innumerable crevasses, aggregating, in 1875, a length of about one hundred miles, and throughout this part of the river the deposits have raised its bed so much as to greatly injure navigation and to cause smaller floods to rise to heights never before attained.

This question is of such vast importance, and in view of my dissenting from the report of the commission, I trust that I will be pardoned for explaining, at some length, the general principles underlying the plan of improvement recommended by the commission, and the relation which the levees have to that plan. It should be borne in mind that this plan is only applicable to the rectification of a sediment-bearing river, and not to rivers flowing through rocky beds, and whose waters are clear. It should be especially noted also that this plan, when fully executed, will render the further use of levees almost, if not entirely, unnecessary. A more ready understanding of the principles upon which it is based will be had by first briefly describing the formation of the lower or main alluvial basin of the river.

This basin extends from Commerce, Missouri, a few miles above the mouth of the Ohio, to the Gulf of Mexico, and has an average width of about sixty miles. Its length is about six hundred miles in a direct line, and it contains about thirty-four thousand square miles, or an area equal to that of the State of Indiana. At the upper end of the basin a spur of the Ozark Mountains has been cut through by the river at the town of Commerce, and through this, over a rocky bottom, six or eight miles in length, the Mississippi now flows. Forty miles above Cairo, on the Ohio River, the same spur has been cut through by that tributary. Throughout this entire basin, bounded by highlands on each side, we have every reason to believe that an estuary of the Gulf of Mexico once existed similar to the Gulf of Saint Lawrence, or to the Rio de la Plata, which is now being filled and built up by the immense mass of deposits annually poured into it by the Parana and Paraguay Rivers. The floods of the Mississippi River, being highly charged with sedimentary matter, have filled this ancient and extensive estuary with alluvial deposits to the height of about three hundred feet above the sea at the upper end of the basin. The surface of the land thus made by the river has a comparatively regular descent from the upper end of the basin to the Gulf, being at Gaines's Landing, midway to the Gulf, about one hundred and forty feet above the sea. Through these deposits the river winds its tortuous course in a channel about eleven hundred and fifty miles long.

Experience and observation prove most conclusively that the quantity of solid matter which the water of the river is able to hold in suspension is strictly regulated by the velocity of the current. Therefore, during the natural process of this land formation, whenever the flood waters escaped over the banks of the channel, the loss of current in the water thus escaping caused the sandy or heavier portions of the solid matter held in suspension in it to settle almost immediately on the submerged banks; while the argillaceous and lighter portions, which take longer to settle, were carried back by the feeble current to the swamps or lower lands, on which they were deposited over a much more extensive area. These lighter matters now constitute the blue and other colored clay strata which are found in all parts and at all depths of the basin. The river banks were thus kept constantly higher than the lands more distant from the stream. Before any levees were built on them they were usually from ten to fifteen feet higher than the lands one or two thousand yards distant from the river.

The size of the flowing volume of any river constitutes, as will be seen hereafter, a very important element in determining the velocity of its current, and as the loss of volume over the natural banks has the effect of producing a more sluggish current in the main channel, a deposition of sediment resulted wherever this loss occurred.

In this manner the bed of the stream, during each successive flood, was built up higher and higher, while the water escaping over the banks built them up also. Thus the river and its banks were both gradually elevated above the neighboring lands until some important breach occurred in one or the other bank, and caused the river to seek a new channel through or over the lower lands. Illustrations of this process are frequently occurring at this time in the lower part of the basin. Sixty miles above the mouth of the river its flood surface is now seven or eight feet higher than the mean level of the Gulf, and through this sixty miles it flows

to the sea between narrow banks that have been elevated by repeated overflows above the sea-level.

From time to time the river has broken through these narrow embankments and found a steeper and shorter route to the salt water. Through such new route its heavily laden waters bear immense quantities of sediment, which is deposited in the Gulf at the mouth of the outlet, because the current can carry it no farther. About thirty-five miles above the mouth one of these outlets, known as "The Jump," occurred about forty years ago. It has already formed over a hundred square miles of territory upon which rice plantations exist, and on which trees are growing larger than a man's body. From six thousand acres of this land, purchased from the State of Louisiana, were obtained nearly all of the willows used in the construction of the jetties. The gradual enlargement of this sub-delta has lengthened the outlet and flattened the surface slope of its branching channels that the current from the river through them, even in flood time, is now too sluggish to carry the heavy sedimentary matters of the main river by that route to the sea, and hence this outlet is gradually closing up. When it first occurred the water in it was one hundred feet deep; now it is scarcely four or five.

During this land-building process of the river outlets were doubtless formed from time to time throughout the entire six hundred miles of the basin, in a similar manner to the one described at "The Jump." Occasionally the conditions were such as to cause the entire stream to forsake its old channel, and in this way it was enabled to distribute its deposits throughout the whole width of the basin from bluff to bluff. Cut-offs and crevasses facilitated this distribution, and the elevation of the bed and the banks of the stream gave it the ability to maintain a sufficient height above the adjacent lands to send its earthy matters many miles away from its channel, while the unstable character of its banks enabled it to change its location from time to time, and thus to cover every part of the basin with its deposits.

Levees stop this land-building process, because they restrain the floods within the defined channel of the river, and so long as they are intact it is impossible for the banks or the bed of the river to be built up to greater heights by the natural process just described. It is an error completely, and often disproved, but still repeatedly advanced by misinformed persons, that rivers confined between levees have a tendency to have their beds elevated, and, as a consequence, to need a corresponding elevation of the levees. The Po and the Rhine and other rivers in Europe effectually disprove such assertions. Their channels have been deepened and their floods lowered as a consequence of perfect levees, and this, it will be presently seen, is an inevitable result of the laws which control the phenomena of sedimentary streams, wherever they flow in channels made through their own deposits. These principles or laws I will now endeavor to explain.

The term "slope of the river" is used by engineers to indicate the inclination which the surface of the flood bears to the sea-level. When "the slope" is referred to without qualification, it means the flood line at the various points along the river, and is synonymous with the term "the fall of the river per mile." It has no reference to the slope of the bottom of the river. One end of the slope is unalterably fixed by the Gulf of Mexico. Other points in its line may be lowered or elevated to a certain extent by natural or artificial causes.

The force which produces the current is the fall of the water from a higher to a lower level, and the slope is an indication of the amount of this force. Other conditions being the same, the steeper the slope the more rapid will be the current.

The chief element which retards the current is the friction between the water and the bed of the stream. This friction increases as the surface in contact with the water increases, and is therefore greatest where the width is greatest, and conversely it is least where the width of the channel is least. Hence it is evident that the velocity of the current may not only be increased by increasing the slope but also by decreasing the friction. It must be remembered that nearly all of the sedimentary matter transported by the water is carried in suspension, and that the quantity carried is in proportion to its velocity. Only a small quantity of it is rolled along the bottom. Hence if the current be checked when its waters are heavily charged with this sediment, (as they always are in flood time,) a deposition of a portion of their burden becomes inevitable.

No fact in connection with the river is more thoroughly established than that the current in flood time cannot be checked in the slightest degree without causing a deposition of some part of the sediment. Screens of iron wire with meshes one foot square, placed across shoals in the Missouri River, have sufficed to retard the current enough to cause deposits sixteen feet deep to be formed during one flood, and in this simple manner new banks have been developed in excessively wide parts of that river to deepen its channel and lower its slope. Willow screens, first used at the jetties at the mouth of the river for the same purpose, raised the bottom during one flood, over a large area at the head of the passes where it was from twelve to sixteen feet deep, almost to the surface of the water, and seventy or eighty acres of land covered with vegetation are now to be seen on the eastern side of the upper end of the South Pass channel that has been thus formed.

I have named three controlling principles which are present in every problem presented by the characteristic phenomena of the river. Each one of these is very simple in itself. It is, however, absolutely necessary to remember each of them to fully comprehend the subject and to be able to recognize the respective influence of each in creating these phenomena. I will briefly repeat them to more strongly impress their importance. The first is the force producing the current. This force is simply the result of the fall of the river from a higher to a lower level. The second is the frictional resistance of its bed. The third is the intimate relation between the quantity of sediment carried in the water and the velocity of the current. If we increase or decrease the current from any cause, we increase or decrease the quantity of sediment carried by the river. We can increase or decrease the current temporarily by either of two methods, namely, by altering the slope, or by altering the frictional resistance. Therefore, by these two methods the scouring and depositing effect can be produced. If we increase the current during the floods we produce a greater deepening and enlarging of the channel through the shoals, and they are left in better condition during low water, and at the same time we ultimately lower the height of the floods. If we decrease the current we produce shoals and higher floods.

The river from Commerce to the Gulf, between the levees, is simply a grand trunk into which is poured all of the sedimentary matters of the tributaries. This trunk must discharge as much sediment as it receives, or that which it does not discharge must be left in the channel and thus injure navigation. If it discharges more than it receives, the excess must be taken out of the bed of the channel, and it will be deepened thereby and the floods will be lowered. Hence it follows that by the process of deposit, or scour, the river has the ability to produce a current capable of carrying its sedimentary burden, without loss or gain, to the sea. This velocity of current we may call the normal current. In seasons of great floods the normal current will be more rapid than when the waters are less highly charged with sediment. This normal current is produced by the river itself as a result of these three controlling principles. Flowing over a bed of deposits, from which it takes up additional sediment when the current is too rapid, it thus deepens the bed, and with it the slope, and thus the current declines. If it be too sluggish, deposits fall to the bottom, and by raising the bed it increases the slope, and as this is steepened the current is accelerated until the normal velocity is again attained. It follows, therefore, that it is not in the power of man to permanently increase its current above the normal velocity. If it be increased from any cause, the water will take up an additional burden from the bed of the river and thus enlarge and deepen its channel, and its slope will be thereby reduced, and with this reduction will follow a reduction of current and the scouring will cease as the current diminishes

until the normal rate is attained, and then the channel will be sufficiently enlarged and the slope so lowered as to prevent any further scouring.

The importance of the levees as a means of improving the navigation of the river comes wholly from the relation which the volume of a sedimentary stream bears to the frictional resistance of the bed. If the volume be diminished, the ratio of friction to the volume will be increased; and conversely if the volume be increased the ratio of frictional resistance will be decreased. Hence, if it can be shown that a higher velocity of current results from the retention of the whole volume within the levees, it must follow that a greater amount of sediment will be transported, and if this amount be greater than that which the tributaries contribute, it must be taken up out of the bed to the benefit of navigation, and the flood line must consequently be lowered to such a degree as will finally reduce the excess of current which the increased volume has produced down to the normal velocity. The increase of volume which will be secured by the closure of these gaps will produce this increased current.

Through these a large part of the volume of the floods now escapes, and this force the river is expending in its prehistoric occupation of land-building—a process wholly incompatible with the occupation of this vast alluvial district by man. Instead of letting this waste force be thus employed, the plan recommended by the commission proposes to utilize the entire force of the river to deepen its channel for the safe transit of the immense products of the valley, and for the safe discharge of its entire volume of flood waters without interrupting in any manner the avocations of commerce and agriculture. That it is entirely practicable to retain within the present levees the entire flood discharge of the river, if they be repaired, even without raising them any higher, I will now endeavor to prove.

The relation which the volume bears to the frictional resistance will be readily understood by examining the foregoing diagram. Let us suppose the Mississippi River in flood to be 118 feet deep and 3,000 feet wide, and that an additional rise of five feet then occurs. The increase of friction in this case is only on the two sides of the channel which are in contact with this additional five feet of depth. This frictional or wetted surface on the two banks would probably not exceed an aggregate width of twenty feet. The water flowing in the stream before this addition was made to it had a frictional surface of about 3,100 feet in width. The five feet additional rise increases the cross-section in such case from about 200,000 to 215,100 square feet, or 7½ per cent., while the friction will have been only increased about two-thirds of 1 per cent.

We see, therefore, that the ratio of friction decreases with an increase of volume, and, as a natural result of this, we must have an increase of velocity of current, and consequently an increased capacity of discharge in the stream. But in addition to the increase of velocity from the diminished friction, the five feet elevation materially increases the slope also, and thus adds another cause to increase the current. Carrollton is one hundred and twenty miles from the Gulf; therefore a five-foot rise there increases the slope one-half an inch per mile.

The semicircular diagrams are intended to show how rapidly the frictional resistance increases if the river be divided into two or more channels. The large semicircle may be supposed to represent the bed of the main river, its capacity being equal to that of the two smaller ones. The wetted surface or frictional resistance is increased by this subdivision 41 per cent. Hence it is simply impossible for the water to flow as fast in two channels, unless they have steeper slopes, as it would if it all flowed in one channel. This part of the diagram, however, is more particularly intended to illustrate the force of what I have to say later in reference to the closure of the Atchafalaya.

Some idea of the immense increase in the capacity of the river to discharge its floods, as a result of this reduction of friction and increase of slope, may be inferred from a few facts I have tabulated from the exact measurements of Humphreys and Abbot during the floods of 1851 and 1858. They are excerpted from Appendix D of their report. These measurements were made at two places on the river nearly 1,000 miles apart, and when the floods were confined within the levees.

August 25, 1851.....	8.1	572,388	3.38
Difference.....	6.8	577,010	2.81

We see by the first table that when the river at Columbus was 83 feet above low-water mark an additional rise of only 2.1 feet was sufficient to increase the mean current nearly one foot per second, and that the discharge was one-sixth greater.

The depth of river at the time was about 96 feet. Therefore, this 16 per cent. increase of discharge was attained with the addition of only one-fortieth part of its depth.

The second table shows that a decrease of 6.8 feet in the height of the river at this place resulted in a loss of more than two and one-half feet per second in the current and a diminution of 508,000 cubic feet per second in the discharge. If we suppose the banks of the river to have been ninety feet above the bottom of the channel, this table proves that with levees only seven feet high upon them they would retain a sufficiently increased volume to add 60 per cent. to the discharge of the river and over 45 per cent. to the velocity of the current.

The third table shows that at Carrollton, near New Orleans, an increase of three feet in the height of the river added nearly 30 per cent. to the amount which was discharged, (almost doubling the percentage of increase shown with a rise of 2.1 feet at Columbus,) while the current was accelerated at the same time more than 20 per cent.

The fourth table shows that at four feet greater height of the river it discharged 40 per cent. more water and that its current was increased 32 per cent.

The fifth table shows that with a difference of only 6.8 feet the discharge of the river at Carrollton was more than double. The river here at the lowest stage was 115 feet deep. Hence there was an increase of only one-seventeenth part of its total depth required to produce this astonishing difference in the discharge of the river. The velocity was at the same time increased 85 per cent.

These tables are the result of actual observation and careful measurements. They represent stubborn facts, without any theorizing, and they show how absurd are some of the statements made as to the effect of outlets in lowering the floods of the river. For instance, the fifth table shows that when the river (March 19, 1851) was nearly up to the highest water mark known at Carrollton, it would have required an outlet larger than the Mississippi itself to lower it 6.8 feet. Such outlet would have had to discharge 577,000 cubic feet per second, while the whole river could only discharge 572,000 feet, when its surface was 6.8 feet lower. This enormous quantity of water (577,000 cubic feet per second) would cover a square mile one foot deep in about forty-eight seconds.

In twenty-four hours it would cover 1,800 miles to the same depth, and in less than a fortnight it would put an average depth of three feet over an area as large as the entire State of New Jersey. To lower the river only two feet at Carrollton when in flood would require an outlet as big as Red River. This is because such loss of volume lowers the slope and increases the frictional resistance in the main stream below the outlet; and this causes it to flow more slowly, and thus prevents that great reduction in its height which the thoughtless would expect.

When we refer to the three principles governing this problem and know how thoroughly they are established by experience, observation, and experiment, and remember the intimate relation, existing between the quantity of sediment carried and the velocity of the current, it would seem impossible to arrive at any other conclusion than that the loss of velocity which invariably accompanies a lower height of the flood line cannot fail to result in a deposition of sediment in the channel of the river, where such loss of velocity occurs during a flood when the water is carrying such an enormous volume of sediment. But this fact does not rely for proof upon the plain deductions to be drawn from a consideration of the three principles we have referred to. The numerous soundings and examinations made of the bed of the river show that below every outlet its channel is reduced in size by the deposits thrown down as a result of the loss of volume through such outlet and the consequent reduction in velocity of current.

The floods do not come so suddenly but that the increased velocity due to the increased volume is felt many days before the floods rise near the top of the levees, and if these gaps were closed, I have no doubt that the increased velocity resulting therefrom would enable the floods to be discharged without any danger of their overtopping the present levees. It is possible that some very extraordinary flood, if it occurred the next year after they were closed, might break through them or escape at some one of the lowest points in them; but extraordinary floods are exceptional, and it is altogether possible that before another one comes the channel of the river would be restored to the dimensions which it had when these levees were intact, and when they were capable of discharging any one of the ordinary floods which occurred.

If they be left open, new shoals and injurious changes in the channel will be occurring at other points of the river than those selected by the commission for immediate improvement, and these new obstructions and changes in the channel will require so much more additional work, and this will undoubtedly cost twice or thrice as much as it will to repair the levees. By repairing them the channel will not only be prevented from becoming worse at any point on the river but the shoaling which has occurred as a result of these outlets will be removed by the effect of the levees, and the works of improvement can then be limited to the reduction of the excessively wide places which now exist, and which are inclosed by the present lines of levees. These wide places are the cause of cut-offs, caving banks, shifting channels, and vexatious shoals.

The plan of improvement recommended by the commission differs from any other previously proposed for the correction of the channel, in the fact that it looks to a rectification of the high-water channel by the ultimate narrowing of these wide places as the only method by which a deep and uniform low-water channel can be permanently secured. The wide places in the high-water channel create alternations of current velocity and steeper slopes to overcome the excessive frictional resistance. These cause the water to be highly charged with sediment at one part of its journey to the sea and much less highly charged at others. This creates scouring and depositing in the bed and radical changes in the channel by the caving away of its banks. By reducing these wide places to a width approximately the same as that of the narrow parts of the river the friction is reduced, a lower slope and more uniform depth will be obtained, and the velocity of current will not be subject to its present changes.

A uniform charge of sediment will result from uniformity of current velocity, and the caving of the banks will then be practically arrested, for the reason that when the water has the full charge of sediment due to its velocity it can carry no more, and cannot, therefore, scour the channel more deeply, by which the undermining of the banks is effected. Permanence of channel will not, therefore, be secured until these excessive widths are reduced. A less depth at low water than twenty feet will not insure stability of channel, for the reason that a less depth will result from only a partial reduction of the wide places. Permanence of channel will be attained only in proportion as uniformity of width of the high-water channel is attained, and when this is secured the depth at low water may be considerably more than twenty feet, but it will certainly not be less.

The sooner these wide places are corrected the less will the improvement of the river cost. The maintenance of the levees, as far as they may be necessary to control the floods, will greatly lessen the cost of the work, because the retention of the water within them will prevent new shoals from forming during the narrowing of the wide places, and because the larger the volume of a silt-bearing river in flood-time the deeper will be its channel. Through the three hundred and thirty miles below the mouth of Red River the river has a comparatively uniform width, and the caving of the banks is very slight as compared with the changes occurring in the eight hundred and twenty miles above Red River. In conclusion I may say that what I have urged here in regard to the closing of these gaps is but a repetition of an argument made by me before the Committee on Commerce of the House six years ago. In closing my address to the committee I then said:

"There can be no doubt of the entire feasibility of so correcting the Mississippi River from Cairo to the Gulf that a channel depth of twenty feet during the low-

water seasons can be permanently secured throughout its entire course, and that the alluvial lands on each side of its waters can be made absolutely safe from overflow without levees by such correction. This can be accomplished for a sum entirely within the ability of the Government and one really insignificant when compared with the magnitude of the benefits which would flow from such improvement. Until such work is accomplished an annual expenditure for the maintenance of the levees is imperative."

THE ATCHAFALAYA.

I cannot agree with the recommendations of the commission for the correction of the river at the mouth of Red River. The report sets forth the following facts:

"The enlargement of the Atchafalaya has steadily progressed since the removal of the raft therefrom by the State of Louisiana. Now it has a capacity of discharge nearly equal to Red River, and affords a line of least resistance for the flow of that stream to the sea. The discharge of Red River into the Mississippi is now small and infrequent. The outlet from the Mississippi to the Atchafalaya is almost constant, and at times very large. The elevation of the water surface at the junction of Old River and the Mississippi (that is, the old mouth of the Red River) is almost constantly above that at the head of the Atchafalaya. The difference, on the 13th of last October, being 7.3 feet in the distance of about five miles. There is a marked tendency to increase this difference of level, and also to enlarge both the communication between the Mississippi and the Atchafalaya, and the Atchafalaya itself."

The recommendations of the commission to which I object are as follows:

"We therefore recommend that at the earliest possible time a continuous brush sill be laid across Old River, between Turnbull's Island and the Mississippi, at such point as surveys show to be advisable, with the object of checking the enlargement of the outlet from the Mississippi at that point."

"We also recommend that the study of the subject be continued, in order to ascertain, first, the expediency of completing the divorce between the Mississippi on the one hand and the Red and Atchafalaya on the other."

It seems to me that these recommendations completely ignore the principles underlying the general plan of improvement recommended by the commission. In its report, dated 17th February, 1880, these principles, in their relation to islands, are thus set forth:

"It is a well established law of hydraulics that the ratio of frictional resistance, per unit of volume, increases if the sectional area be diminished. Thus, if the volume of a river were suddenly divided by an island into two channels, the water flowing in them would encounter more frictional resistance than it met with while flowing in a single channel. Hence, the currents through these channels would be more sluggish, and as the water is charged with sediment, the sluggish current would cause a deposit in the channel, which would first begin at their upper ends, and would continue until the bottoms of the two channels would be so steepened that the current would attain a velocity capable of carrying the suspended sediment through them without further deposit, and the slope of the river's surface in flood time would be found to be steeper through them than above and below where the volume flows in a single channel."

When the Atchafalaya was made it formed an island, which is bounded by the Atchafalaya, the Mississippi, and the Gulf of Mexico, and it conforms precisely to the conditions set forth in the above extract. The report just referred to further says:

"In the case of a crevasse, an island is also formed, having the main body of the river on the one side and the crevasse channel on the other side. As the volume flowing in the main channel below a crevasse has been decreased by the amount drawn off through it, a steeper slope in the main river, if the crevasse be kept permanently open, becomes inevitable, because the shoal below the outlet, as it grows in length down stream, from the deposition of successive floods, gradually increases the frictional resistance of the volume flowing through that diminished channel, and this tends to check the current of the river above the crevasse, and thus the shoaling of the river bed and the raising of the flood line above the site of the outlet ensues as a secondary and permanent effect."

"It is in this way that silt-bearing streams, flowing through alluvial deposits, have the ability to increase or steepen their surface slopes, and thus recover the velocity of their currents, and adjust them to the work of transporting the sedimentary matter, with which the flood waters are charged, so that this matter may be carried without loss or gain."

"In proof of the correctness of these views, and of their full accordance with well-established hydraulic laws, we have the evidence of this relation between slope and volume presented in the phenomena of silt-bearing streams all over the world. Whenever such streams flow through alluvial deposits, other conditions being the same, the slope is least when the volume is greatest, and conversely the slope is found to be invariably increased as the volume is diminished."

There are no truths in science more capable of complete demonstration or more generally recognized by hydraulic engineers than these, and the effects already created by the Atchafalaya, and which are contained in the present report, bear ample testimony to the soundness of the deductions thus advanced. For instance, the volume in the main river below the Atchafalaya outlet is decreased by the volume carried off through the Atchafalaya; therefore, in proportion as the lower Mississippi has lost this volume, according to the principles laid down by the commission, the slope of the river or its flood line should be steepened, for the commission correctly says:

"The slope is found to be invariably increased as the volume is diminished."

The last report of the commission says:

"No decrease of flood heights on the Mississippi, from which volume has been abstracted, is observable as the result of increased outlet in the gauge records at Natchez, Red River, or Baton Rouge, although it practically amounts to the diversion of a tributary with about one-sixth of the flood discharge of the Mississippi."

In other words, the Mississippi, below Atchafalaya, is to-day carrying one-sixth less than it did formerly, and yet no diminution in its flood line is observable at these points below the outlet. No better evidence could possibly be given of the fact that the bed of the main river below the Atchafalaya has gradually been filled with so much deposit, under the influence of the depleting effects of the Atchafalaya, that only five-sixths of the former flood volume is all that is now required to bring the surface of the floods to the same height on the levees that they attained when the main river received the volume of the Red River.

The report states further:

"But such a decrease of flood elevation has been observed in the Atchafalaya, to which the volume abstracted from the Mississippi has been added."

When we refer to the principles adopted by the commission we find it stated—

"Whenever such streams flow through alluvial deposits, other conditions being the same, the slope is least when the volume is greatest."

The volume has been steadily increasing in the Atchafalaya, and, as a natural result of such increase, its slope has diminished. It now carries off the volume of the Red River and a portion of the Mississippi water, and the commission state as a fact that "a decrease of flood elevation has been observed in the Atchafalaya."

This is precisely in accordance with the principles adopted by the commission, and these facts conclusively prove "the inexpediency of completing the divorce between the Mississippi on the one hand and the Red and Atchafalaya Rivers on the other." There is no need of further study, it seems to me, upon the question of such divorce; but, on the contrary, there is every reason for immediate action to prevent not only the further loss of volume from the Mississippi but to restore to it the discharge of Red River, which is now going down the Atchafalaya. It would probably not be advisable to reduce the cross-section of the Atchafalaya to occupy more than about one-sixth of its volume per annum, which would thus restrict six years in its complete closure, although the tables I have already given

of the discharge of the river at Columbus and Carrollton show that the entire discharge of the Red, if added to the Mississippi when both are in flood, would only increase the height of the Mississippi two feet below the Red River.

The steepening of the slope of the Mississippi below the Atchafalaya has been progressing ever since that outlet began to be enlarged, and, as an immense amount of deposit must have fallen on the bed of the stream to raise the bottom of the river so high that the abstraction of one-sixth of its original volume produces no reduction in the height of its floods, the removal of this deposit should be made gradually. If it be permitted to rob the Mississippi of this great tributary permanently, by the construction of the proposed sill, we may be certain that a further raising of the flood line of the Mississippi will be the consequence, not simply below this outlet, but above it also. Of course, if the capacity of the crevasse be increased, as in this instance, additional shoaling will occur in the bed below it. It is not easy to foretell exactly how long the secondary effect (that of shoaling above the outlet) will continue. The diminution in the capacity of the channel below the outlet increases the frictional resistance, because the ratio of friction increases as the volume is diminished.

But the amount of this additional resistance increases as the shoaling extends on down stream, for the same reason that a long pipe of a given capacity and slope will not discharge as much water in a given unit of time as a shorter one with the same head, diameter, and slope. Hence, although the channel is diminished by deposits immediately below an outlet during the next ensuing flood, yet this shoaling may not extend sufficiently far down stream to react perceptibly upon the current above the crevasse, until after successive floods have still further extended the shoaling and thus lengthened, as it were, the diminished channel through which the river then flows. The raising of the flood line above the outlet, by which an increased slope is given to the river below it, is, however, only a question of time, if the outlet remain in full force. It will gradually raise the floods higher and higher above the outlet, until a steeper slope below it restores the normal current. The slope of a sediment-bearing stream is adjusted by laws as immutable as those which control the planets, and a further flood elevation above this outlet if the volume of the Red River be lost to the Mississippi, is inevitable.

To me it seems that no treatment of the river is more plainly indicated by the observed facts than that which I have the honor to recommend upon this subject. I have not the least doubt in my own mind that the complete closure of the Atchafalaya will produce a lowering of the flood line at the mouth of the Red River of several feet within a few years afterward. The prevention of the escape of any portion of the discharge of the Red River down the Atchafalaya will also have the effect of benefiting the navigation at the mouth of Red River; it will restore deep navigation between the Red and the Mississippi Rivers, without the necessity of further works. Communication between the Atchafalaya and the Mississippi by a system of locks will become a necessity before the complete closure of that outlet, but these would also be still more needed if the Red and Atchafalaya be separated from the Mississippi, as the commerce of the Red River must then be provided for also.

The lowering of the slope, which will certainly follow the closure of this outlet and the reunion of the Red and Mississippi, will benefit the river channel and lower the floods so materially throughout the entire eight hundred and twenty miles of river between Commerce and Red River, that the saving in the cost of maintenance of the levees during the correction of this part of the river will enormously exceed the cost of the works, including the locks for the Atchafalaya; besides, it will give to the extensive region between the Red River and Commerce much more complete immunity from overflow, by the enlargement of the Mississippi River below the Atchafalaya; while the Atchafalaya country will be made safer and safer in proportion as the head of that stream is closed.

Instead of constructing the sill to interrupt communication between the Mississippi and the Atchafalaya, I would, for the reasons given, earnestly recommend the immediate construction of a sill in the Atchafalaya, near its upper end, to diminish the volume flowing through that outlet; and, from year to year, as rapidly as may be deemed safe, cause this sill to be built up until it shall finally constitute a dam, completely separating the Atchafalaya from all communication with the Red and Mississippi Rivers. The result of this will be to increase the volume flowing in the main river, and improve the depth of water on bars below the Red River, on which, at low water, only ten feet depth now exists.

HARBOR OF VICKSBURG.

The report recommends that the improvement of this harbor be attempted by revetting Delta Point against further erosion, and by dredging out a basin and a channel leading to the harbor, by which steamers will have access to Vicksburg landing. The first cost of this dredging is estimated at \$536,000, and the revetment of Delta Point at \$100,000 more. I do not believe Delta Point can be permanently revetted for an additional \$100,000. Two hundred and twenty-nine thousand dollars have been heretofore appropriated for this purpose, and, as the report declares, this work, "owing to many unforeseen difficulties, has been much more costly than was anticipated." The failure to successfully revet and maintain this point will increase the estimated cost of dredging the channel and basin proposed in the report.

My experience has taught me that of all methods of deepening channels in, or connected with the Mississippi River, that of dredging is one of the most costly, uncertain, and least permanent. The plan proposed, if carried out successfully, would entail upon the Government an annual expenditure for the dredging of this basin and canal, which would, no doubt, equal one-eighth, and most likely one-sixth of its first cost, or at least \$40,000 per annum. This would represent the interest on at least a million dollars, and with the first cost of the work would make this plan of improvement cost about a million and a half dollars. For this sum, and perhaps for much less, the river can be made to resume the channel it followed thirty or forty years ago, when it washed the shore of Vicksburg, and before it created the extensive bend now cut off by the new channel, at the foot of which bend the city of Vicksburg stands.

I should not attempt to restore the channel around De Soto Island, but simply extend Delta Point until a sufficient portion of the island is cut away to force the channel against the wharf. This method of improvement would make the river flow in a permanent channel at Vicksburg, and save its citizens from the uncertainty which would attend the maintenance of a channel and harbor by dredging and from the certain injury to the commerce of that city and to that of a large district dependent upon it for the conveniences of shipment, in the event of Congress failing at any time hereafter to make the regular annual appropriation which would be required for dredging out the proposed channel and basin. I do not believe the plan recommended will be attended with satisfactory results if it be executed.

For these reasons, and because I know it is practicable to extend Delta Point artificially to a sufficient distance to throw the channel against the old landing at Vicksburg, I recommend that this work be undertaken for the permanent rectification of the river at this place. Approximate estimates made by me show that this can be accomplished for \$1,200,000, and deep water permanently secured at the Vicksburg wharf without further outlay for maintenance. Two hundred and fifty thousand dollars could be profitably expended upon this work during the ensuing year.

IMPROVEMENTS BETWEEN THE MOUTHS OF THE MISSOURI AND OHIO RIVERS.

The commission in its report, in speaking of the improvements now being carried on by the War Department between the mouths of the Missouri and Ohio Rivers, a distance of about two hundred miles, says:

"The success of Captain Ernst's works thus far justifies, in our opinion, the

methods he has employed, and we are of the opinion that it should be pushed toward completion under liberal appropriations.

I cannot join with the commission in this indorsement and recommendation, for the reason that the plans now being executed by Captain Ernst have never been submitted to me for examination. I have been informed that a committee appointed by the commission did examine these plans and approve them; but so far as I know they were never submitted to the commission itself.

Before I would feel justified in giving my approval to detail plans for the improvement of any portion of the river, it would be necessary for me to carefully consider them, not merely in the light of the immediate results which the works might be expected to accomplish but also as to their effect upon other parts of the river. It would also be necessary to know whether the plans proposed for the special locality were in full accord with the general plan of improvement recommended by the commission, and, assuming the plans to be correct, whether they were to be carried out with due regard to economy in the expenditure of money.

Under the act of Congress creating the commission, it is charged with the responsibility of reporting plans for the improvement of the entire river, and it alone is responsible for them. I do not believe the public expectation will be met by exempting so extensive and important a section of the river as this two hundred miles from the supervision of the commission. This was done by a clause in the last appropriation of \$600,000 for this part of the river, and the effect of the present recommendation is to encourage the disbursement of a like sum without any control of the works by the commission.

I do not desire to be understood as condemning the plans which are now being executed by Captain Ernst; but I cannot unite with the commission in indorsing them, for the reasons stated.

Very respectfully,

JAS. B. EADS.

General Q. A. GILMORE, U. S. A.,
President of the Mississippi River Commission.

APPENDIX B.

[Remarks of Professor Henry Mitchell before the Committee on Levees and Improvement of the Mississippi River.]

WASHINGTON, March 11, 1882.

Professor Henry Mitchell, a member of the Mississippi River commission, was invited to address the committee, which he did, as follows:

I think, Mr. Chairman and gentlemen, that the facts which we desire to lay before you are pretty nearly all in, and therefore I do not desire to make any extended remarks, but I shall be very happy to answer any questions that you may put.

An observation has been made by the gentleman from Texas [Mr. JONES] in regard to the question of floods, which expresses the idea exactly to my mind, namely, that the rising of the river and the overflowing of its banks increases its friction on the surface and thereby checks the progress of the water and increases the tendency to overflow; and I think that Major Harrod did not state exactly what he meant when he said that he regarded the loss of the levees as the only cause of the deterioration of the river above. I think he would have added that the widening of the river would of itself have produced the same effect.

Mr. HARROD. I meant to include that also.

Mr. JONES. I understood Major Harrod to include the spreading of the waters, no matter from what cause.

Mr. MITCHELL. Then I entirely concur with him in the opinion he has expressed. The effect of confining the water of the river in reducing floods rather than increasing them (which seems like a paradox) can perhaps be stated a little better and more clearly from an entirely theoretical point of view. You all know that the most economical water carrier is a cylindrical pipe, because the frictional surface is in the least ratio with the capacity of the pipe. The best conduit is a semi-circle, for the same reason that the frictional surface bears the smallest possible proportion to the capacity. Now, in the case of a cylindrical conduit the ratio of the border of the stream transversely to the depth in the middle of the stream is as 3 to 1. That is the most economical water channel, a channel in which the perimeter shall bear the ratio of 3 to 1 on the maximum central depth. Of course we never find in nature such a conduit, but we find approximations to it wherever we find a fair, deep stream with good navigation. Now, so far from this economy of surface being realized in the troubled portions of the Mississippi River to which Major Harrod has referred, the proportion instead of being 3 to 1 is, at low water, 1,000 to 1; that is, three hundred times as great as it should be.

But in another portion of the river, say below New Orleans for eighty miles, you have an approximate realization of the economical channel, because in that section of the river, which is narrower, you have a depth of one hundred feet, so that your ratio of perimeter is about 24 to 1, and you are rapidly approaching the cylindrical form. I do not mean to say that the two cases of Plum Point or New Madrid are parallel exactly with that portion of the river which lies below New Orleans, but the conditions are similar in a great many respects, and at New Orleans you have only fifteen feet rise, because you have a less frictional surface in proportion to the area and the capacity of the stream, so the water passes off more easily. In the lower part of the river, where the proportion is as 1 to 24 instead of 1 to 1,000, you have a depth of one hundred feet as a mean for one hundred miles above New Orleans and seventy miles below, and the lowest water you have in the shoalest part is sixty-five feet. The reduction of width has been from 6,000 feet above (at Plum Point) to 2,350 below in the neighborhood of New Orleans.

Now you do not want sixty-five feet of water for navigation; you want twelve feet, and that is all you expect to get; so that this is not a great encroachment which is expected at Plum Point, where there is already five or six feet; and in a large portion of the river no encroachment would be required at all to produce the necessary navigation, because the depth increases so rapidly with the diminution of the width. For example, you have ten times as much water in front of New Orleans, with half the width, that you have at Memphis or Plum Point. I am just fresh from a little study of the Delaware, which is a minute stream compared with the Mississippi, but which has all the characteristics of the larger river. Some portions of the Delaware have been leveed for a hundred years, and as far as I can observe, the response of the river to the process proposed by the Mississippi River commission has been prompt and satisfactory, and excellent results have come from a systematic procedure upon substantially the principles and the method proposed by the commission. The stream has been leveed, then it has had its shores occupied by wharves and other structures, and the bottom has given way just about so fast. The Delaware is a stream which is subject to floods. I have not the figures to show the size or extent of those floods, but, so far as I know, they have not increased. The bottom has given way about as rapidly as the shores have been raised, so that the stream is in as good condition now as it ever was in respect to floods, and in a great deal better condition as to navigation, having twelve or fifteen feet more water.

Mr. DARRALL. What kind of material has been used in the construction of the levees on the Delaware?

Mr. MITCHELL. Substantially the same as on the Mississippi—heaps of sand or earth.

Mr. DARRALL. Can you give us any information as to their size or height?

Mr. MITCHELL. I cannot give you anything definite. They appear to be about the same height as those along the Mississippi—four or five feet high.

Mr. GUNTER. Are the banks protected as indicated by Major Harrod for the Mississippi banks?

Mr. MITCHELL. No, sir; not by any process that had for its purpose only revetment. They are protected in various ways for the sake of valuable property.

Mr. CARPENTEE. And those protections have been found to last?

Mr. MITCHELL. Yes, sir. In some places they are permanent structures.

Mr. CARPENTEE. And they accomplish the purpose of protecting the banks?

Mr. MITCHELL. Well, the purpose of erecting them was not directly to improve the navigation of the river, but the improvement has resulted nevertheless.

APPENDIX C.

[From report of Hon. John R. Thomas, from the Committee on Levees and Improvement of the Mississippi River.]

Mr. ROBERTSON. I desire, Captain Cowdon, to ask you some questions which have been handed to me by my colleague, Mr. Ellis. The first is: "Will the jetties prove a failure?"

Mr. COWDON. I will give you my opinion about that.

Mr. KING. I suggest to my colleague from Louisiana that he put his questions to be answered categorically.

Mr. ROBERTSON. I should like to have Mr. Cowdon answer them as nearly as he can. I do not ask for his reasons.

Mr. COWDON. You will have to permit me to answer them in my own way. You ask your questions and I will answer them in my own way and give you my reasons. In answer to the question you have asked I will say, that I do not believe that any system of work at the mouth of the Mississippi River can ever maintain the channel there that we ought to have. I do not believe that by jetties or by dredging you can ever get over twenty-five or twenty-six feet of water, and that is not enough.

Mr. ROBERTSON. That is a sufficient answer. I will ask another question. If they do fail, will it not be necessary to construct a ship canal from the Mississippi River to deep-sea water?

Mr. COWDON. That is what I have always thought. There are two ways of doing it, one is by the Saint Philip route, and the other is by the Barataria route.

Mr. ROBERTSON. That point is covered by the next question. Which is the best route for said canal?

Mr. COWDON. I am of the decided opinion that the Barataria ship-canal route is the best; it is the only route where we can get as much water as we ought to have.

Mr. ROBERTSON. Therefore, then, you say that the Barataria Canal to Fort Livingston is the best practicable route?

Mr. COWDON. I think so.

Mr. GUNTER. State whether that route shortens the distance to the ocean?

Mr. COWDON. Yes; it is fifty-five miles by that route from New Orleans out to the sea, while by the mouth of the river it is one hundred and twenty miles. It is also a little nearer for vessels going to New York than by the Southwest Pass, and nearer to all the Gulf ports.

Mr. ROBERTSON. In case the jetties fail, that canal will have to be opened as the outlet for Western commerce, will it not?

Mr. COWDON. I think that is the best route.

Mr. ROBERTSON. Are you not interested in that canal?

Mr. COWDON. I am, sir.

Mr. ROBERTSON. You are its original and principal incorporator?

Mr. COWDON. I am.

Mr. ROBERTSON. Then your personal interests are involved in the failure of the jetties?

Mr. COWDON. Not at all.

Mr. ROBERTSON. Because the failure of the jetties would necessitate the construction of your canal?

Mr. COWDON. Not at all, sir. They can make the Saint Philip Canal if they want to; the failure of the jetties would necessitate the making of some other outlet, but it would not necessitate the making of that one at all. I merely give you my opinion that that is the best route. The engineers, however, have reported in favor of the Saint Philip route.

The first gentleman submitting plans (as will be observed from the foregoing evidence) were Mr. John Cowdon, of Memphis, Tennessee, and Captain Thomas Leathers, of New Orleans, Louisiana. Each of these gentlemen advocated what is known as the outlet system. The particular outlet favored by them was one to be made by opening a crevasse from the Mississippi River into Lake Borgne.

In the beginning your committee were inclined to think quite favorably of the plans proposed by Mr. Cowdon, but subsequent investigation has convinced the committee of the folly of such a course, as we are satisfied, first, that nothing has injured navigation and contributed so much to the building up of bars and shoals in the Mississippi River as outlets which have been caused by the giving way of the banks at various points along said river during extreme high water.

Congress has expended large sums of money in securing deep water at the South Pass. An outlet at Lake Borgne, which is something like one hundred miles above the head of the passes, would have the effect of slackening the current below the outlet, and thereby causing increased deposit, not only above but in the jetties, thus destroying the splendid navigation found there at the present time.

In answer to questions put to Mr. Cowdon by your committee, it was ascertained that he and his associates had contracted for and now control the land through which it was proposed to make this outlet. He asks for an appropriation of \$250,000 to begin with, and says that he shall ask Congress to appropriate \$500,000 after the work shall have been completed and a channel of a requisite depth for safe navigation through the outlet has been secured. The evidence of a distinguished engineer shows that the outlet proposed could be made for \$250; whereas Mr. Cowdon asks \$250,000.

Mr. Cowdon also admitted to your committee that he was the principal owner of the lands and property through which it was at one time proposed to dig the Barataria Canal. Your committee is satisfied that, if the Lake Borgne outlet should be made, within a very short time the jetties at the mouth of the Mississippi River would be rendered entirely useless, as the silt borne by the Mississippi River would within a short time fill up Lake Borgne, and the waters out to the Gulf, while the navigation of the Mississippi River would be completely destroyed through the passes, and it would become necessary to open a canal either at Barataria or at Saint Philippe; and, as reports of engineers have shown that the Barataria is the most feasible of all the canal projects for outlet to the Gulf, it appears to your committee that there is more to the promoters of the proposed Lake Borgne outlet than appears at first view. It appears also that the adoption of their plan would destroy the jetties, thereby ruining the navigation of the Mississippi River at its mouth and necessitating the opening of the Barataria Canal. Your committee are satisfied that no greater mistake could be made by Congress than to adopt the outlet system as proposed by Mr. Cowdon and Captain Leathers. The principal object of the promoters of the outlet system seems to be the reclamation of the alluvial lands from overflow, instead of improving the navigation of the Mississippi River.

On the other hand, while your committee would be glad to see all the rich alluvial lands of the Mississippi River freed from overflows, still it is satisfied that the plan proposed by the Mississippi River commission is the best that ever has been proposed to secure safe and permanent navigation of the Mississippi River, and that that is the first object to which Congress should devote itself. And having an abiding confidence in the intelligence and integrity of the Mississippi River commission, we believe that both objects will be secured by carrying into effect the plans proposed by said commission, and recommend most earnestly the passage of bill H. R. No. 5393, the substitute herewith proposed by your committee for bill H. R. No. 4781.

Improvement of the Mississippi River.

SPEECH

OF

HON. JOSEPH H. BURROWS,

OF MISSOURI,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, June 7, 1882,

On the bill (H. R. No. 6184) making appropriations for the construction, repair, and preservation of certain works on rivers and harbors, and for other purposes.

Mr. BURROWS, of Missouri, said:

Mr. SPEAKER: Were it not that I am a member of the committee which reported this bill, and that, under the rules of this House, have had this matter in charge, I would keep my seat and let others speak who are older in years, abler in counsel, and that have devoted much study and thought to this national enterprise, which should have engaged the attention of the Forty-seventh Congress at an earlier day than this, for, taken as a whole, and in all its bearings, present and prospective, the improvement of the Mississippi River, by whatever plan, is the peer of any other measure that has or will engage the attention of this body. It is well known that we spent days in discussing the "polygamy bill," "Chinese immigration," "tariff commission," and other measures of minor moment. This Hall has resounded with eloquence, logic, wit, and sarcasm upon scores of subjects trivial in their nature and import when compared in magnitude and importance to the commerce of the West, as linked by nature to the navigation of this great "Father of Waters"—a proud title it has justly earned as the years and centuries have come and gone.

This grand old river, reaching, as it does, from lakes to Gulf, and it can be said from zone to zone, stretching out its broad arms until it grasps the Alleghanies on the east and the Rockies on the west, within the sweep of whose tributaries there reside to-day not less than twenty-five million people, and within whose mighty basin or valley there are homes for two hundred million more—this river, if improved as it should be, is capable of bearing upon its bosom the entire commerce of the civilized world. That the Giver of all good intended this magnificent stream as the great artery of North America none can doubt; and as we gaze upon the map of the United States and behold this colossal stream with its many tributaries upon the right and left from Gulf to lakes, we are overwhelmed in astonishment and wonder at the wisdom of the All-wise in creating for the benefit of mankind these thousands of miles of navigable streams—canals, as it were, fashioned by the hand of God—answering a twofold purpose: to carry off and drain the land of surplus water, and afford a means of easy communication and transportation for the products of the soil.

Mr. Speaker, the area drained by the Mississippi is but little less than eight hundred million acres of land surpassingly rich beyond the same amount to be found upon the inhabitable globe; more than enough to make one hundred and fifty States as large as Massachusetts—as large as England, France, Prussia, Austria, Spain, Turkey in Europe, and Italy combined, and if inhabited as densely as the most thickly populated countries of Europe would contain four hundred million souls. The mind cannot grasp these numbers nor the grandeur of such a Republic as ours would then be. The question, then, for us to settle here is how to help, aid, and assist in making this priceless inheritance greater, richer, and more desirable as homes for these coming millions who shall march down the ages yet to come. Ours is a progressive race; its sweep is onward and yet onward.

We are amazed as we look backward at the magnificent strides of our progenitors. Shall we be less thrifty, enterprising, and daring than they? I trust not. And I hope our local interests and State pride will be laid aside when we come to consider the improvement of this great trunk line of navigation sweeping down between ten States of this Union and environing as many more with its tributaries. Let us not make this an omnibus bill into which to crowd every river and harbor improvement measure now before Congress. In a word, the less ought not to cripple nor govern the greater, for in the improvement of the Mississippi River we inaugurate an enterprise that produces the greatest good to the greatest number. When the trunk has been cared for we cannot stop until every water-way that connects or may be made to connect with it has been improved as far as is feasible. And for one I expect that long before this century closes the Mississippi River and the lakes will be connected by canal in such a way that at times of drought in the Mississippi Valley the waters of the great lakes as a mighty reservoir will more than supply the deficiency, giving a full stage of water from the Upper Mississippi to the Gulf.

Mr. Speaker, this is no new measure or cunningly devised scheme of robbery to take from the Treasury millions of money without returning compensating benefits, nor yet a local matter gotten up by the people of Louisiana to protect their rich sugar lands from inun-

dation, however it may incidentally lead to this; for all can see at a glance that if the waters of this great canal can be kept within its properly defined limits or walls such terrible havoc and loss of life and property as were recently witnessed (and even at our remote distance, with but a bird's-eye view and faint imagination, has been painful and pitiable, but to those eye-witnesses heart-rending and agonizing) will be prevented, the land made valuable and productive, and the sanitary condition of the lower Mississippi Valley increased an hundred-fold; these but add to the desirableness of at once beginning the work. Can the United States erect a Government custom-house, court-house, or post-office building in any city of this Union in which it may erect any of those magnificent granite and marble buildings without enhancing the value very largely of all the real estate adjacent, and proportionately of the city as a whole where such buildings are located? And yet no one argues that this is building up a local interest or fostering a State enterprise. I hope, then, we shall hear no more of this being a purely local matter, and one which the States in their separate capacities should attend to.

In the year 1845 the first interstate convention, so far as we have any record, met in the city of Memphis, or rather there were two conventions that year in that city. At the first six States were represented, at the second twelve States, with about five hundred delegates, and the president no less a personage than Hon. John C. Calhoun. This was not called specifically in the interest of the Mississippi River, but of internal improvement generally. In 1847 another river and harbor convention assembled at Chicago, at which were present many men who have since become noted in our country's history, as Abraham Lincoln, Charles Hempstead, Tom Corwin, Robert C. Schenck, Dudley Field, John C. Spencer, Horace Greeley, and many others. In 1851 a large convention was assembled at Burlington, Iowa, and was, if I mistake not, the initiative work in the improvement of the Rock Island and Des Moines Rapids of the Mississippi River. In 1866 another convention met at Dubuque, Iowa, and the following year witnessed another grand convention, and since that time there has scarcely a year passed that conventions have not been held at some of the principal cities in the valley of the Mississippi. The lower or Des Moines Rapids has been quite well provided for in a canal that is in almost constant use during the season of navigation; the upper rapids have and are being deepened from year to year, and all this at an expense of several millions of dollars to the General Government and for one I can say I think the money well spent. I mention these incidentally to show what has been the practice of Congress for years past.

Mr. Speaker, we cannot consider this question as we ought without taking into consideration the vast contribution of this valley in supplying the sustenance of this nation as well as our enormous shipments abroad to aid in feeding the civilized world. The large percentage of our exports of grain, flour, tobacco, and cotton, not to mention our beef and pork, plead more eloquently than I, and point with pride to the teeming fields of this great valley. From the census we learn that not less than 1,400,000,000 bushels of corn were produced by this region, and over 300,000,000 bushels of wheat, and about as many bushels of oats, and 3,600,000 bales of cotton. These figures are for nineteen States, whose rivers find an outlet to the Gulf through the channel of the Mississippi. We have here a grand aggregate of 2,000,000,000 bushels of grain. Now, all that is not consumed in the country is to find a market elsewhere in the world; and one of the great problems of civilization is distribution, which we call transportation; and the settlement of this vexed question has much of weal or woe for the vast millions of the sturdy sons of agriculture. Look at the multiplied thousands of petitioners from every State and Territory in the Union, asking Congress to take some action in the regulation of interstate commerce, which means the placing of limitations or restrictions upon the freight and passenger tariff by railroad; and already we see forming in this country a party expressly organized to resist the encroachments of monopolies, and especially of railroads.

Mr. Speaker, I am no enemy to railroads nor have never seen a man who was. What would have been our rate of development without them I am unable to say or even to conjecture. It is safe to conclude that millions of acres of the broad prairies of the West would to-day be unbroken, and thousands of beautiful villages that are scattered over this vast country in every direction would to-day have no existence whatever. The building of railroads has extended the frontier line of settlement and civilization westward at a most marvelous rate. All this we feel and appreciate, but who has built the railroads? Is it not a fact that hundreds of millions of dollars and hundreds of millions of acres of land have been given to these railroad corporations, and with what result. I beg to incorporate in my remarks a quotation from an address delivered by Hon. J. H. Murphy at the "river and canal improvement convention" held at Davenport, Iowa, May 25-6, 1881, as this matter is presented in a better light than it is in my power to do. I see no permanent solution of this vexed question except by furnishing a cheaper means of transportation than the railroads, and one that cannot be monopolized, nor its capacity exhausted, but like the shadow of a "great rock in a weary land," where the tired and wearied traveler rests and refreshes himself and pursues his journey but leaves the rock and shade for others; so with steamboat and barge and raft, which for a moment disturb and trouble the waters as they bear the commerce

of nations and then all is placid and still. But to Mr. Murphy's description. He says:

The Mississippi Valley, the cornucopia of this continent, the granary of the world, is forced to pay annually over \$25,000,000 as their portion of this corruption fund, and so long and so regularly has it been practiced that even our cattle and hogs instinctively know, when they are eating the corn that will fatten them, that the railroad companies and stock-yard bosses will get five-eighths of their carcasses, and their lords and masters the balance. These railroad companies, influenced by a refined sense of unqualified greed, make their strength most potential (Dennis Kearney like) by both pooling their issues and earnings. This pooling system is the ligature that binds them together like the Siamese twins, and having no soul to damn, they have no conscience to quicken. Did not Jay Gould, the Tycoon of railroad magnates, shamelessly, and with bold effrontery, volunteer the statement under oath, to the committee appointed by the Legislature of New York, that as manager of the Erie Railroad he used money to buy up the Legislatures of four States; that in a Democratic district he was a Democrat, in a Republican district a Republican, in a Feather-head district a Feather-head, in a Half-breed district a Half-breed, in a Sore-head district a Sore-head, but in all an Erie man; that large sums of money were paid to influence elections and guide legislation; that this money was charged to the "India-rubber account," and when pressed for details his memory was as elastic as the account. He finally confessed that instances were so numerous where money was used, that it would be as impossible to enumerate them as it would to recall to mind the number of freight cars that passed over the Erie road from day to day. Why, these railroad kings estimate their wealth in bulk, and only count by millions. And so rapidly have they acquired wealth that the tale of Aladdin and his wonderful lamp in comparison has lost its gloss of fiction.

Within the last twenty years Huntington, Hopkins & Co. were only known to the people of San Francisco as small shop-keepers. By a recent legal investigation Mr. Leland Stanford's wealth is estimated at \$34,500,000, Mr. Charles Crocker about the same amount, Mr. Hopkins at \$25,000,000, while Mr. Huntington's wealth is estimated at more than either of the others, making an aggregate of over \$100,000,000 piled up by these gentlemen in less than twenty years out of the profits of the Central Pacific Railroad Company.

The late Commodore Vanderbilt commenced railroadings some twenty years ago, and his wealth was estimated at that time not to exceed \$10,000,000; when he died his estate was estimated at \$80,000,000.

When Jay Gould obtained the management of the Erie in 1873, his wealth was estimated not to exceed \$5,000,000; to-day the good Lord only knows how much he is worth, for it would puzzle the arithmetic of memory to compute it.

Will it be claimed that such Cæsar-like wealth as this can be acquired in so short a time fairly and honestly? These men, like the lilies of the field, toil not, neither do they spin, and yet I say unto you that even Solomon in all his glory was not arrayed like one of these.

And yet, gentlemen, the extortionate rates charged, with the pooling system as a tender to make it more binding and certain, is not so ruinous to commerce and agriculture as the discrimination in rates. The former is a slow consumption that quietly but surely surrounds the lungs of commerce and the products of the farm, and steadily feeds, while there is life; but the latter is an epidemic that baffles the skill of experience, and no known remedy can arrest its deadly progress. In support of this statement, allow me to say that in an investigation, armed with authority, there was brought to the surface the astonishing and appalling fact that certain oil men, whose refinery is on Long Island, got rebates in eighteen months to the amount of \$10,000,000; per consequence, seventy-nine houses engaged in the same business were broken up. Why, a single flour-mill in any city or town can stop the wheels of all the rest if it can obtain a rebate lower than its competitors. A dozen coal mines are located in a certain neighborhood, all finding sale for their coal in the same market. If one is favored by a rebate it flourishes, grows sleek, declares dividends with singular regularity, while the others, with all the capital, machinery, and fixtures, are remitted to the blue mold of time, to be cursed by the rust of age.

My friends, these railroad monarchs either own or control a goodly portion of all things terrestrial, and it has been recently discovered by the proceedings in the telegraph suit that they have a hard grip upon things celestial, and it has occurred to me that Ben Franklin could hardly have thought, when he tried to induce the goose to take a dose of lightning, that his wisdom and knowledge of science would be used to oppress the American people—a people he so dearly loved.

Yes, gentlemen, the American people have witnessed this state of things for years, and have grown dizzy looking with alarm upon the power wielded by the railroad companies in all departments of life, social, political, and financial. This alarm, thus created by the wrongs perpetrated, has invoked the power of the people and their representatives to come to the rescue by legislative action.

Some little good has been done in that direction, but still the pall of oppression, like the miasma that rises from the marshes and sour swamps of the lowlands, fills the atmosphere of commerce with sickness and death, until to-day sober men are asking with enthusiastic earnestness, will this state of things always continue?

I answer, no, not always. The American people (right by instinct) have tried kind words by assisting the construction of rival roads with liberal donations and more liberal subsidies, upon the theory that competition would furnish the remedy. Alas, how have they been disappointed. By natural law the sturgeon swallows the minnow, and the whale swallows both, so it has been seen that in the construction of railroads as competing lines, to the end that freight would be carried for a fair, just, and remunerative price, the competing lines have been swallowed up, and to-day form the arcs that make the railroad circle most complete. Turf was then thrown by legislative action, and a partial attempt was made to regulate railroad rates by law, but the demagogue was found in the place of the statesman, and the bribe-taker was most unanimous in loud declamations, specious arguments, and dislocated excuses. So, you see kind words and turf are of no avail, and hence it is that the American people, north and south, east and west, producer and consumer, have risen up like one man, determined to furnish a remedy for the evil, and if necessary throw stones, by the improvement of our natural water-ways and the construction of artificial ones. "For it is cheap transportation, or not cheap transportation; that is the question."

Gentlemen, we have assembled here for a common purpose, being impelled by the same necessity. It has been bruited that opposition would be found in this assembly. This cannot be, for there is no difference of opinion, and hence there should be no hostility of action. So let us murder that thought here and now by common consent.

We are as much interested in the improvement of the Mississippi River as any city that rests in her valley, and to-day we hail with joy and satisfaction the movement of Western produce through the enterprise of the barge lines. We have shown our allegiance in the past by sending delegates to every convention called in her interest; not a dollar has been voted to improve her navigation that has not received our vote and sanction. And what we have done in the past is simply an earnest of what we will do in the future, and neither shall the scornful look of jealousy, the quiet mutterings of envy, nor the loud denunciation of foul slander take us from the path of duty. In fact I may say we are not and should not be hostile to any means of transportation—railways or water-courses; the more ways of transportation the better.

But, gentlemen, we are wedded to one way, and that way is the cheap way. I do not mean by a cheap way that freight should be carried at a sacrifice to the carrier, for if I thought railroad companies did not receive more than a full 8 per cent. net upon the actual capital invested I would not offer one word of complaint,

but I do insist that inasmuch as all, or nearly all, civilized governments have made a legal protest by fines and penalties against high rates of interest for the use of money, and denominating it usury, that capital invested in the carrying trade should not be an exception.

Yes, my friends, we are in favor of doing all that is necessary to be done to improve the navigation of the Mississippi River, and if it is deemed necessary in the near future to call a convention in its interest, Rock Island, Moline, and Davenport will only be too willing to give it aid and comfort, for it is not only visible to the naked eye but competent persons, after all the most diligent investigation, unite in saying that natural water-courses are the cheapest modes of transportation; that artificial water-courses the next cheapest, and railways the dearest.

The Chicago Times recently said upon this subject:

In reality there is not a navigable water-way in America that is not a more potent regulator of railway-freight tariffs than all the railway managers and all the legislative genius of the country combined would be.

Mr. Speaker, I am not opposed to Congressional legislation or of State, to properly and equitably regulate the schedule of rates of railroads, as they bear the vast commerce of this country from place to place; nor would I cripple or embarrass their building; nor do I want their owners defrauded out of a fair rate of interest upon the actual capital invested in their construction; but I do say that cheap freights are an absolute necessity, and I can conceive of no way of securing this to the people and at the same time present a barrier and force more omnipotent and one which never can be disturbed or removed to regulate overcharges, discriminative or unjust rates by railroads, than an improved river system in the valley of the Mississippi and outlets to the lakes by canals.

Let us look for a moment at the encouragement which the Government has given to the two methods of transportation. We have over 14,500 miles of water-ways; to their improvement less than \$20,000,000 have been given, or about that amount, or say \$1,500 per mile. Now, to aid in the construction of railroads 187,785,800 acres of land, which, at the nominal price of \$1.25 per acre, gives us the enormous sum of \$234,000,000. To this may be added a loan by the United States to the several Pacific railroads, about \$65,000,000, and has paid in interest \$35,000,000, or a total of \$100,000,000. If to this we add the State, county, township, and municipal contributions, we shall have the enormous amount of four hundred and fifty or five hundred millions of dollars. The comparison is, to say the least, not very creditable. Now, let me direct your attention to the marvelous growth in the shipments via the Mississippi River since the jetty improvement in 1878. The total increased tonnage from the city of Saint Louis was, for the year 1878, 688,970 tons; for the year 1879, 893,800 tons; for the year 1880, 1,037,525 tons. The increase in the shipment of corn in bulk rose from 3,585,589 bushels in 1879 to 9,438,538 in 1880, and that of wheat from 2,397,897 to 5,735,679 bushels; and flour is shipped for 17 to 20 cents less per barrel from Mississippi points via New Orleans to Liverpool than via New York. This all argues better prices for the producer in the West. "The freight on bulk grain from Saint Louis to London, by way of New Orleans, at latest advances, was 46½ cents per hundred, or 27 cents per bushel, and on flour 35 cents per hundredweight. The added cost of insurance is 1.55 to 1.95 cents per bushel. The total expense, including insurance, from Saint Louis to London, is therefore about 29 cents per bushel."

Can better arguments be adduced than these for the improvement of this natural highway—if, indeed, we are looking to the interest and welfare of the "horny-handed" sons of toil who, under the scorching rays of the summer sun, create the vast wealth that has made us rich and prosperous? It is high time that we turn our thoughts and shape our legislation in the direction of benefiting, strengthening, and encouraging the poor, the weak, and the oppressed, rather than adding to the millions of the rich. I trust I may be pardoned for making a brief quotation from Governor John H. Gear, in his first message to the Legislature of Iowa. Touching this subject, he said:

Owing to natural obstructions in the channel of the Mississippi River, and its virtual closing during the late war, our products have, of necessity, been carried to market by rail alone. By the recent completion of the canal around the rapids at Keokuk, and of the apparent success of the system of jetties now in operation at the mouth of the river, whereby ships of large draft have easy access to New Orleans, thus giving additional facilities for the transportation of our products to foreign ports, it is plain to see that in the near future a healthy competition must arise between the railway and river systems of transportation, the benefits of which must accrue directly to our grain-producing interests; and it is to be hoped that Congress will, at an early date, stimulate this competition by a sufficient appropriation of money to cause the further improvement of the navigation of the Mississippi and its tributaries, in order that Iowa and all the States bordering on this great highway may have the largest benefits possible to be derived from additional facilities in the transportation of their products.

Some one has said that water-ways (rivers and canals) were the only regulators of the railroads, and this is demonstrated every year in the opening up of navigation upon the lakes and the Erie Canal, and wherever a river runs parallel with a railroad.

France has about five thousand miles of navigable rivers and canals, upon which she has spent over \$200,000,000. England has spent even more than this to secure cheap water transportation. Congress cannot shirk this matter of giving relief to the varied industries scattered all over this country that are so largely dependent upon cheap freights as the means of success and profit.

PROTECTION.

A great deal has been said by the members of the Forty-seventh Congress about protection to American capital and labor, and a commission is to be appointed to investigate this matter and report;

to this I gave my voice and vote. But let us consider the protection that is demanded not alone by the thousands rendered homeless and destitute by the great floods the past winter and spring. I find the following comment in a Philadelphia paper during the time:

The crevasse.—The distressing details of the floods on the Lower Mississippi have been the main feature of the news during the past week. The penny-wise and pound-foolish policy of Congress is producing its natural consequences. To say nothing of the loss of life and the suffering caused by the unusual floods of this season, the destruction of property, direct and indirect, will amount to more than the cost of good substantial levees at all the exposed points on the river. And this is a national as well as a local and private loss. Every man in the country will feel it more than he would have felt the cost of constructing good levees at the expense of the Union.

The area of the alluvial lands along the Lower Mississippi and tributaries is over forty thousand square miles, being as large as the combined areas of New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, and New Jersey. It is 75 per cent. of the area of England. The area of the Mississippi Delta reduced to acres is 26,363,520. Fully 90 per cent. of these alluvial lands are susceptible of cultivation and are unsurpassed in fertility in the world. In 1870 less than 10 per cent. of this vast area was under cultivation, and the sole and only reason that prevents the settlement and improvement of these productive lands is because of the periodical destruction of crops, stock, buildings, and danger to health and even life from the overflow of the river.

Mr. Morey, in his report to the House of Representatives during the Forty-second Congress, said of the floods of 1868 and 1871:

The destruction caused by the last two floods above named in the Ouachita Valley is almost incredible. A valley of almost unexampled fertility, capable of raising, beside corn and stock in great abundance, at least seventy-five thousand bales of cotton, worth at the average price of this season more than \$5,000,000, was inundated, plantations destroyed, buildings washed away, cattle and swine by the thousands starved and drowned.

The flood of 1874 was even more destructive. Mr. ELLIS, in his report to the House in 1876, says of it:

The loss by the flood of 1874 was \$13,000,000. This year, [1876.] so far as it can be ascertained, it is \$2,000,000. And this makes the total sum of \$15,000,000 in actual material wealth within three years. Here is the cause of these inviting fields and lands remaining uncultivated and in idleness, and their values are trivial when compared with their productive possibilities if once protected from the overflows. But I must not dwell upon this lest the grand work of improving and restraining the Mississippi be denominated a scheme to protect the tillable lands of the Lower Mississippi.

Mr. Speaker, I read a very sensible article in *The American* of April 29, 1882, bearing upon the constitutionality of the improvement of these inland rivers, and as it is quite short I will ask to have it printed with my remarks; it presents what I would term a clear common-sense view of what may be termed constitutional when brought within the spirit, if not the letter, of the fundamental law—an instrument of writing adopted over a hundred years ago, when the Mississippi did not belong to us, but was the property of France:

The President's view of the constitutional powers of Congress, as to dealing with the Lower Mississippi, is challenged by both a Northern Republican and a Southern Democratic Senator—Mr. HARRISON and Mr. MORGAN. Objections of this kind have lost much of their force with the American people, as during the war they learned to think anything constitutional which was good sense. No document drawn up a century ago could anticipate the emergencies of national life as fast as these would arise. So Mr. Jefferson found, less than a score of years after it was framed, when he had the offer of Louisiana and took it without constitutional authority. The proposal to legalize his act was rejected on the ground that nobody found any fault with it. The same rule should apply to the case of the Mississippi. There should be no two minds about it. This thing cannot be done by the States, and it must be done. If the Constitution says nothing about draining flooded lands, it does authorize the regulation of commerce between the States. And the National Government, in making the grand river a highway for that commerce, can give the States the security they need against inundations.

Yes, not only against inundations, which in and of itself is a sufficient reason, but absolutely protects them from the merciless ravages of railroad monopoly and excessive charges at will by the kings of the rail, and thus holding the destiny of the West and South in the grasp of a few men. When the bill for making the Commissioner of Agriculture a Cabinet officer was before this House and was being discussed, my colleague submitted the following amendment, and supported it with the fact and argument which follow, a part of which I have once before called attention to, *i. e.*, the magnificent donations of the public domain to railroad corporations. I will read it and invite the attention of the House, as I am convinced we cannot get too much light upon a subject of so vital importance to the whole country, but to the farmers of the Mississippi Valley particularly:

"It shall also be the duty of the statistician to report monthly the railroad freights and tariffs upon the principal lines of transportation. Also any discrimination which may be made upon any of said lines for or against certain localities."

Mr. HASLITINE. Mr. Speaker, according to the statistical report of the Chamber of Commerce of Charleston, South Carolina, for 1882, the States of Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Missouri, Ohio, Tennessee, and Wisconsin produce three-fourths of the grain crop of the whole country. In 1875 the total crop of the United States was 2,032,235,300 bushels, of which 1,467,237,000 were grown in the States named. In 1880 these States produced 2,003,204,000 bushels out of a total crop of 2,686,145,120, or an increase over 1875 of 535,967,000 bushels, or about one hundred million bushels a year.

The principal grain-shipping cities in the Northwest are Saint Louis, Peoria, Chicago, Milwaukee, Duluth, Detroit, and Toledo.

The receipts of grain and flour at the Atlantic and Gulf ports in 1875 amounted to 188,357,221 bushels, of which 178,114,750 bushels came from the same Western cities just named. In 1880 the receipts had grown to 364,017,557 bushels, of which 321,539,058 came from these cities, being an increase in six years of 143,424,308 bushels, or an average of about twenty-four million bushels a year. The grain and flour of the West are now brought to the Eastern ports by five trunk lines of rail-

roads, and by the New York canals. Of late there have been large shipments to the Gulf by the Mississippi River. The profit of the Western farmer and dealer is determined mainly by the rate charged for the transportation of the produce to the Atlantic or Gulf ports. During the summer months the competition between the railroads and the canals prevents exorbitant charges, but during the winter months, when the canals are closed, the railroad rates are injuriously high. This is shown by a comparison of the rates charged at different seasons in the six years from 1875 to 1881.

The charge for carrying a bushel of wheat in the years named averaged 11 cents by water and 17 cents by rail during the period when the canals were open, and 22 cents a bushel by rail during the winter, when the canals were closed. Now, we say that a just system of legislation should certainly keep the rates of transportation down to the summer average. This would be a saving of 5 cents a bushel. This saving in the shipments from the same cities named would amount to at least \$14,406,257 a year, with no larger shipments than those of 1880. Five cents per bushel upon wheat at 20 bushels per acre would be \$1 per acre upon all the wheat lands. Five cents per bushel upon corn at 40 bushels per acre would be \$2 per acre upon all of the corn lands. This would be equal to one-half of the average rent upon all wheat lands and full rent upon all corn lands of the West and South. There is no doubt that a rate very much less than the summer average would render a liberal compensation for the use of the real capital invested by the owners of the roads.

We have donated to wealthy corporations a quantity of land sufficient to make eight States as large as Ohio; we have paid large sums of money; we have bonded debts spread over the counties of most of the States of the West. Yet the Government, in its great liberality to capitalists, after having contributed so large a proportion in building the railroads, donates all to companies with special privileges to control the freights according to what they will bear, which makes all the farmers of the West and South renters, and a large number of paupers, with an aristocracy of railroad kings in the Eastern cities. This is a more ingenious system of rentage and serfdom than that of Ireland. We demand that all of these great public highways shall be controlled by the Government in accordance with the great principles of equity. "We demand equal and exact justice for all, and special privileges for none." Agriculturists ask for no special legislation to protect that class of wealth producers in this country.

The capitalists who have received these immense lines of transportation, largely as donations from the people and the Government, meet in council and determine what portion of all the crops they will take as rents from all of the farms of the West and South. These capitalists control to a great extent the elections, and send their attorneys to make laws for their renters. They place their attorneys upon the bench to enforce such laws. Another class of capitalists to whom the Government donates from \$15,000,000 to \$20,000,000 annually, and who are interested in the defenseless condition of American renters and dependent laboring classes, also help to control the elections and to control the Government in the interest of a moneyed aristocracy. The object of the Government should be to encourage and protect all of the industrial classes in the development of the resources of the country.

The Government should protect both producers and consumers in an equitable system of cheap transportation and cheap currency. We ask that the Department of Agriculture shall be an Executive Department; not that sinecure places may be made for favorites of party; not merely that large books may be published minutely describing worms, bugs, beetles, and locusts, as though they were the principal enemies of the agriculturist, but that independent, non-partisan business men shall be made officers of this department, who will fearlessly perform their public duties, and may show to the country that special legislation granting special privileges to capitalists makes paupers in the West and millionaires in the East. As about thirty millions of the American population are employed in agriculture, simple justice requires a proper consideration of the rights, interests, and just protection of this large proportion of the great producers of American wealth. Let the Department of Agriculture be made practically useful to the people. Let its officers be authorized to collect all such statistics as may be necessary in developing all of the great resources of the country, and showing what legislation may be necessary to protect the agriculturists in a just system of transportation and a reasonable enjoyment of the fruits of their toil.

The late war and the amendments of the Constitution decided that there should be no more ownership of the bodies of the laboring classes. Capitalists would now attempt to absorb by special law, granting special privileges, the products of industry. This is now a cheaper and more comprehensive system of slavery, and the money lords have made millions of dollars where the negro owners made thousands. We demand that civil government shall guarantee the divine rights of every laborer to the results of his toil.

The President, in his first message to Congress, thought the improvement of the Mississippi River of sufficient importance to call our attention to it, and I commend to the consideration of this House the wisdom of his words. He says:

I advise appropriations, such for internal improvements as the wisdom of Congress may deem to be of public importance. The necessity of improving the navigation of the Mississippi River justifies a special allusion to that subject. I suggest the adoption of some measure for the removal of obstructions which now impede the navigation of that great channel of commerce.

President Hayes also, in his last message to Congress, presented the subject in the following terse sentences:

[From message of President Hayes, December, 1880.]

A comprehensive improvement of the Mississippi and its tributaries is a matter of transcendent importance. These great water-ways comprise a system of inland transportation spread like net-work over a large portion of the United States, and navigable to the extent of many thousands of miles. Producers and consumers alike have a common interest in such unequalled facilities for cheap transportation. Geographically, commercially, and politically they are the strongest tie between the various sections of the country. These channels of communication and interchange are the property of the nation. Its jurisdiction is paramount over their waters, and the plainest principles of public interest require their intelligent and careful supervision, with a view to their protection, improvement, and the enhancement of their usefulness.

These are words of wisdom, and do credit to the ex-President. But the late and lamented Garfield spoke not less earnestly when the commission bill was being discussed before the Forty-sixth Congress, June 21, 1879:

I believe that one of the grandest of our material national interests—one that is national in the largest material sense of that word—is the Mississippi River and its navigable tributaries. It is the most gigantic single natural feature of our continent, far transcending the glory of the ancient Nile, or of any other river on the earth. The statesmanship of America must grapple the problem of this mighty stream. It is too vast for any State to handle; too much for any authority less than that of the nation itself to manage. And I believe the time will come when the liberal-minded statesmanship of this country will devise a wise and comprehensive system that will harness the powers of this great river to the material interests of America, so that not only all the people who live on its banks

and the banks of its confluent, but all the citizens of the Republic, whether dwellers in the central valley or on the slope of either ocean, will recognize the importance of preserving and perfecting this great natural and material bond of national union between the North and the South—a bond to be so strengthened by commerce and intercourse that it can never be severed. [Applause.] * * * I rejoice in any occasion which enables Representatives from the North and from the South to unite in an unpartisan effort to promote a great national interest. [Applause.] Such an occasion is good for us both. And when we can do it without the sacrifice of our convictions, and can benefit millions of our fellow-citizens, and can thereby strengthen the bonds of the Union, we ought to do it with rejoicing; for in doing so we inspire our people with larger and more generous views, and help to confirm for them and for our children to the latest generations the indissoluble Union and the permanent grandeur of this Republic. I shall vote for this bill. [Applause on both sides of the House.]

And again, in his letter of acceptance of the nomination for the Presidency, he most beautifully refers to the same national interest, as follows:

The Mississippi River, with its great tributaries, is of such vital importance to so many millions of people that the safety of its navigation requires exceptional consideration. In order to secure to the nation the control of all its waters, President Jefferson negotiated the purchase of a vast territory extending from the Gulf of Mexico to the Pacific Ocean. The wisdom of Congress should be invoked to devise some plan by which that great river shall cease to be a terror to those who dwell upon its banks, and by which its shipping may safely carry the industrial products of twenty-five millions of people.

To these I could add many tributes from the ablest statesmen of our nation in every part of our common country who have spoken or written upon this vital question. In this day of steam and electricity, rapid and cheap transportation is an absolute necessity. Every trade, calling, profession, and industry demand it, and that demand is imperative. We must have it; and the quantity, quality, and rate for same must be regular; and upon this particular phase of the subject I call the attention of Congress and the country to the elaborate and exhaustive speech of my colleague, Judge RICE, whose argument is unanswerable and by far the ablest I have heard or read, and I feel that it will receive, as I am sure it is entitled to, a wide distribution among the people.

Everywhere our people are clamoring for increased and cheaper means of travel and transportation, and I am rejoiced to know that the energies of the age are bent in that direction, and that the last decade has witnessed wonderful improvement and reduction of rates, as I shall be able to show before I am done, and our friends in the East are not less energetic and active than we are in the West; in fact, every section has its schemes and plans for increasing the means of travel and of commerce; in short, it may be said there is a wholesome and healthy rivalry that must result in great good to all classes. I will read an article which throws some light upon this subject. It is from the Baltimore Sun, and was intended to bolster up the Chesapeake Canal project:

Later statistics upon the direction of Saint Louis trade.—On the 25th ultimo the Sun gave statistics, drawn from the report of the Bureau of Statistics for 1880, showing the relative shipments east and southward from Saint Louis during that year, with the view of indicating that by reason of the vastly preponderating eastward trade the large tract of the Mississippi Valley, of which Saint Louis is the commercial center, is more interested in improving the outlet from the Chesapeake Bay than in the deepening of the Mississippi channel. Both works, it was sought to be shown, should be carried to completion, but of the two, Saint Louis is concerned most with that one which affects the larger volume of trade. Since the publication of the article referred to the Sun has received, by the kindness of Mr. Nimmo, chief of the Bureau of Statistics, statistical information to a later date. In connection with the figures furnished us Mr. Nimmo remarks: "Twenty-five years ago the commerce of Saint Louis was carried on by river, but to-day the commerce by rail (expressed in tons) is nearly four times that by river. There are no means of ascertaining the average value of the traffic by river and rail. I believe, however, that the average value per ton of the traffic by rail is greater than that by river. The foregoing statement does not include express matter nor merchandise in the mails. If an account could be taken of all this, I believe it would be found that the value of the commerce by rail is from five to ten times as great as that by river." It needs no further authority to enforce the truth that, however favorable the showing of tonnage carried eastward from Saint Louis, its value, with the attendant profits to all concerned, is out of all proportion greater. This consideration adds a new interest to the subjoined data supplied to the Sun by Mr. Nimmo:

Shipments from Saint Louis during the calendar years 1880 and 1881.

Shipments.	1880.		1881.	
	Tons.	Total.	Tons.	Total.
North:				
By river.....	55,260	157,803	54,205	180,626
By rail.....	102,543		126,331	
East:				
By river.....	145,295	1,325,004	82,775	1,293,851
By rail.....	1,179,709		1,211,076	
West:				
By river.....	16,415	818,182	13,720	1,255,976
By rail.....	801,767		1,222,256	
South:				
By river.....	820,555	1,492,216	733,235	1,636,484
By rail.....	671,661		903,249	
Total shipments.....		3,793,205		4,346,937
Total shipments by rail.....		2,755,680		3,462,912
Total shipments by river.....		1,037,525		884,025
Total shipments toward the South.....		1,492,216		1,636,484
Shipment by river toward the South.....		820,555		733,235

By the following table, which exhibits the quantity of grain shipped from south Saint Louis each year from 1871 to 1881, inclusive, the important fact is disclosed that while the shipments south by river were less in 1881 than in 1880, the shipments

south by rail were nearly 100 per cent. greater, indicating that in a competition between river and railways the victory is with the latter:

Year.	East by rail.	South—	
		By river.	By rail.
	Bushels.	Bushels.	Bushels.
1871.....	2,154,065	4,565,973	1,322,457
1872.....	3,456,409	6,618,757	2,194,019
1873.....	2,065,660	5,920,687	1,874,386
1874.....	2,318,350	5,344,534	1,683,478
1875.....	2,658,478	3,260,035	1,877,022
1876.....	12,434,296	4,212,435	995,540
1877.....	6,570,529	5,691,493	1,373,982
1878.....	7,561,475	7,230,422	1,054,221
1879.....	8,227,465	8,506,952	1,360,036
1880.....	8,790,059	18,978,347	2,646,714
1881.....	5,456,643	15,655,705	4,150,656

A large hope had been entertained that the large system of transportation, which was comparatively new in 1880, would in 1881 succeed in engrossing the whole export grain trade of Saint Louis.

The following statement shows the quantity of products of the Western and Northwestern States actually exported from New Orleans, and comparatively the quantity of traffic actually diverted to the Mississippi River from the east and west trunk lines of the country:

Products.	1880.	1881.
	Tons.	Tons.
Quantity of merchandise received by the east and west trunk railroads from the West during the year 1880.....	11,500,000
Tonnage shipped east from Saint Louis during the year 1880.....	1,325,004	1,293,851
Total tonnage shipped south from Saint Louis by river and by rail during the year 1880.....	1,492,216	1,636,484
Tonnage shipped south from Saint Louis by river during the year 1880.....	820,555	733,235
Tonnage of products of the Western and Northwestern States exported at New Orleans during the year ended June 30, 1880.....	317,000

The great decline in the shipment of grain for 1881 must be attributed to the failure in crops for the entire Mississippi Valley for the year 1881, and that is shown in the rail as well as river statistics; and the increased shrinkage in the river over the railroad arises from the fact that our home market throughout the East was quite as good as the foreign, and we had not so large a surplus for exportation.

I will print with my remarks, from Poor's Manual, the following rates, showing the rapid reduction of over 100 per cent. in the last ten years.

Average rate per ton per mile on the Chicago and Northwestern Railway.

	Cents.		Cents.
In 1870.....	3.09	In 1876.....	1.91
In 1871.....	2.87	In 1877.....	1.81
In 1872.....	2.61	In 1878.....	1.63
In 1873.....	2.35	In 1879.....	1.56
In 1874.....	2.22	In 1880.....	1.49
In 1875.....	2.06		

Average rate per ton per mile on the Chicago, Milwaukee, and Saint Paul Railway.

	Cents.		Cents.
In 1870.....	2.83	In 1876.....	2.04
In 1871.....	2.54	In 1877.....	2.08
In 1872.....	2.43	In 1878.....	1.80
In 1873.....	2.50	In 1879.....	1.66
In 1874.....	2.38	In 1880.....	1.73
In 1875.....	2.10		

And these for the last six years, and I call particular attention to the difference in rates between the Eastern and Western railroads, and at the same time remind the House and the country that the Erie Canal competes with the New York Central and the Erie Railroads in the carrying trade between tide-water and the lakes, and ask you to draw your own conclusion as to how much water transportation, even by canal and horse power, contributes to this great reduction? Here are the Eastern rates, and I confess that they are gratifying, if not entirely satisfactory.

The decline of rates on the New York Central is thus reported:

	Cents.
In 1874, per ton per mile.....	1.46
In 1875, per ton per mile.....	1.27
In 1876, per ton per mile.....	1.05
In 1877, per ton per mile.....	1.02
In 1878, per ton per mile.....	.93
In 1879, per ton per mile.....	.809
In 1880, per ton per mile.....	.88

The decline on the New York, Lake Erie and Western is reported thus:

	Cents.
In 1874, per ton per mile.....	1.311
In 1875, per ton per mile.....	1.208
In 1876, per ton per mile.....	1.099
In 1877, per ton per mile.....	.955
In 1878, per ton per mile.....	.973
In 1879, per ton per mile.....	.780
In 1880, per ton per mile.....	.836

It was said on this floor only a few days ago by the honorable gentleman from New York, Mr. DWIGHT, and I have no reason to dispute his assertion, that the Erie Canal was operated at a loss of 20 per cent. last year. This may be accounted for in two ways: first, the great falling off in grain shipments and by the cheap rates of railroad transit, that all know is much more desirable on account of speed, &c. And may it not arise from a preconceived plan upon the part of the railroad kings to so reduce rates as to eventually close up the Erie Canal and lead to its abandonment? They could well afford to carry grain at actual cost of transportation for a few years, knowing that, if this great barrier to higher rates were out of the way, one year of high prices and the exclusive control of the carrying trade would reimburse them for all losses. I would that the West had so reasonable rates by rail, but our only hope is in the equalizing power of the great and noble Mississippi River and its tributaries, where steam may take the place of horse power, and the stream cannot be monopolized nor exhausted.

You will observe I have not committed myself to any particular method or mode of improvement; that is, the levee or outlet systems. I bow to the superior skill and wisdom of those who have made this subject their study, but I will confess that the outlet plan has appeared to me a very common-sense one, and I would be glad to vote for the small appropriation asked for by Captain Cowden to make the Lake Borgne outlet. It appears to me it would at least lower the flood-tide at New Orleans and increase the rapidity of the stream. I will close by a quotation from the summary of Alex. D. Anderson, in his commercial and statistical review of the Mississippi and tributaries, a noble work and deserving of study and thought.

That to consummate and make permanent this natural and direct movement to the seaboard of the products of the valley a general and systematic improvement of the whole river channel is needed from its headwaters to the Gulf.

That the material advancement of the great interior of the United States will be retarded unless its growing demand for inland water transportation facilities is thus supplied.

That the Mississippi and tributaries are located in fertile and well-populated valleys where most serviceable to commerce.

That they further observe the laws of political economy in that their general tendency is southward, connecting opposite climates with dissimilar products, demand, and supply.

That they are remarkably well adapted to the transportation of the bulky freights of agricultural valleys, and have in this respect unlimited capacity.

That they were constructed by nature, without cost to the producer and consumer.

That the cost of their 15,710 miles of navigation, if constructed at the same rate per mile as railways of the United States and their equipments, would have been \$869,740,000.

That if constructed at the same rate per mile as the principal canals of the United States their cost would have been \$615,219,000.

That they supply the producer and consumer with cheap transportation.

That the transportation rates on a bushel of wheat shipped from the center of the valley, at Saint Louis, by river to the seaboard at New Orleans, during the three years 1877, 1878, 1879, ranged all the way from ten to fifteen cents less than by rail to the seaboard at New York.

That if half of the total grain produced in the fourteen valley States in 1879 had to be shipped from that center by river to New Orleans, instead of by rail to New York, the annual saving to the seaboard at ten cents per bushel would be \$90,381,552, and at fifteen cents per bushel, \$135,572,320.

That if in connection with and incidentally to the improvement of river navigation of the rich alluvial lands of the lower valley susceptible of cultivation and comprising an area of 23,727,168 acres were protected from overflow, their increased value, when adequately cultivated, would add to the taxable wealth of the country \$1,936,229,418, a sum equal to the whole national debt.

That if they produced one bale of cotton per acre, the value of their product at four hundred and forty pounds to the bale and eleven cents per pound would be \$1,148,394,931, or more than seven times that of the annual yield of gold and silver of the whole world.

That these water-ways are national in extent and in law.

That they supply cheap transportation from the granary of the nation, and are therefore national in their benefits.

That they are a natural bond of union between the North and the South, and a standing protest against sectional antagonisms.

That the Mississippi or trunk line of this whole system of rivers of the great valley is a connecting link between internal and international commerce.

That it terminates opposite other American countries and islands which have a total annual foreign commerce with all nations (exports and imports combined) of \$928,027,000 in value.

That the present share of this total foreign commerce controlled by the Mississippi—that which flows to and from its sole port—is but \$5,822,800 in value, or less than 1 per cent.

That the river will soon be practically extended to the Pacific Ocean by the completion of the Tehuantepec Inter-oceanic Railroad, and again by the Tehuantepec Ship Railway.

That these commercial outlets to the Pacific, the first ever pro-

vided for the Gulf of Mexico, will bring to the door of the Mississippi Valley new and important commercial fields, Australia, the Orient, the Pacific islands, and the Pacific states of South America, which nations have a total annual foreign trade with the whole world of \$1,724,879,695, and of which total the port at the mouth of the Mississippi controls no portion.

That the commerce with these nations resting upon the Pacific is the weakest and most neglected spot in our trade relations with the outside world, and that their connection with the Mississippi Valley via the Isthmus of Tehuantepec is a matter of great national importance.

That the valley is not fully prepared to improve these grand opportunities and contribute its legitimate share to the foreign commerce and wealth of the nation because needed improvements of its great river or outlet to the seaboard have been neglected.

That no power but the United States, which owns the Mississippi and tributaries, has jurisdiction over their improvement.

That to examine the various and conflicting theories of improvement and prepare and report upon a permanent plan Congress, in 1879, provided for the appointment of a board of skilled engineers, known as the Mississippi River commission.

The commission have submitted their report, and the appropriations for consummating this great national work now rest with Congress.

In conclusion, this plain, simple business question arises: will the United States neglect to keep in good repair its own commercial highways—to protect its own property, having at a moderate estimate a value of \$800,000,000—which rivers were constructed and presented by nature, and which may be made an immense source of profit to the producers and consumers who comprise the people.

Agriculture and Commerce.

SPEECH

OF

HON. JOHN BLAIR HOGE,

OF WEST VIRGINIA,

Tuesday, May 9, 1882.

The House having under consideration the bill (H. R. No. 4429) to enlarge the powers and duties of the Department of Agriculture—

Mr. HOGE said:

Mr. SPEAKER: Thorough as has been the discussion of the pending question, it is scarcely correct to say that it has been debated if the real character of debate be that which involves some conflict of opinion. I have yet to hear, sir, from any quarter a word of opposition to the main purpose of the bill reported by the Committee on Agriculture. It seems to command assent as unanimous as it is unusual; and it is a safe prophecy to declare that whatever form may be given to the measure now before the House, few, very few, will record their names in antagonism to the principle and policy which it involves.

The only question which has arisen does not relate to the propriety or expediency of the proposed scheme of the committee. Its friends differ only upon the subsequent proposition—whether the House should rest content with the plan submitted for its action, or, going further, adopt the substitute of my colleague, [Mr. KENNA,] which, including all the provisions of the original bill, seeks to confer additional powers upon the department to be created by giving to it supervision of other subjects of executive control and administration, believed to be in every sense cognate and sympathetic, in no sense hostile or antagonistic to the great interests of agriculture.

Passing from this proposition for the moment, I beg to say, Mr. Speaker, that the scheme to advance and promote that agency, which, among all the agencies employed by Government, alone represents the wealth and power of agriculture, to the dignity of a co-ordinate executive department is not merely a response to the importunity of petitions or an ill-advised surrender to the demands of a class. It rests upon reason so self-evident and conclusive that argument finds little scope for its logic, and eloquence nothing to achieve by its offices of appeal and adjuration. There is, admittedly, political philosophy as well as political justice in a formal recognition by Congress of the relations borne by agriculture to all other interests of the country. The wide reach of these relations cannot readily be indicated by a few words.

Their measure is more easily found in estimate and conjecture than in tabulated figures or columns of statistics. But whoever will recall the wide expanse of territory which the farmer holds by the right of fee-simple ownership; the vast production springing from the soil in response to the labor of his hands, constituting newly created wealth which enters at once into all the employments of commerce, passing over all the avenues of transportation and interstate communication, seeking its markets where they may most

profitably be found, and returning its rich guerdon as an almost incomputable addition to the aggregated treasure of the land, thus adding to and making, year by year, more certain and secure all the sources of national greatness, will not fail to be impressed with the conviction that we habitually fall short of a true comprehension of the importance and extent of this vast interest. Indeed, sir, one might well go further and, estimating the proportion borne by the agricultural classes to the population of the country, ask with pertinence, whence come your levies in war? Who bear the burdens of your taxes in peace? Who are the consumers of your manufactured products? Who submissively pay tribute to that tyrannic principle which "protects," at their cost and loss, the great Moloch of monopoly?

But enough. It is sufficient to remind those who talk most wildly of national progress and development that these have followed in close proximity the footsteps of the adventurous husbandman; and that the real foundations of national greatness rest only upon the broad expanse of plain and prairie and mountain which constitute the domain of agriculture.

Because of considerations like these I am in sympathy with the friends of the bill. I desire that there shall be full recognition in some form of the relations to which I have referred, and that agriculture shall rank in equal dignity with other interests deemed important enough to require special and particular direction and administration. I shall, therefore, vote for the bill of the committee, although the judgment of the House may differ from my own as to expediency of adopting the substitute of my colleague, [Mr. KENNA.]

But I venture to suggest to the friends of the original bill that, broad as is the scope of the agricultural interests of the country, it is questionable whether the details of the service the proposed department is expected to perform will not be too limited to justify in results the anticipations they have formed. Of course all agencies established by Government grow in time; their reach becomes wider, and the extent of their work increases; but I fear, sir, that the present bill, making every allowance for the varied subjects of inquiry which it prescribes, will not secure an organization such as is expected and desired. Possibly the point of my suggestion may be better presented by reference to the present Department of Agriculture; we all know its history; how from a subordinate branch of the Patent Office it has grown to its present proportions. What are its offices? Beyond the dissemination of information by means of an annual report—which from some cause is never issued contemporaneously with its date—what is effected by that bureau?

A supply of seed and plants, either brought from other climates, with a view to experimental agriculture, or of improved native growth, is distributed to the country with a somewhat meager economy. Beyond these main duties little else can be indicated as constituting the detailed work of this Department. The reports may be more frequent, and information can be more immediately disseminated throughout the country, but the doubt remains whether the administrative duties of an agricultural department distinct and isolated from all other interests will entitle it to take rank with the other Executive Departments.

The following extracts from a paper read before the American Agricultural Association in 1881 by Professor C. V. Riley are important in showing the agricultural estimate of the department:

Let us now glance at the past and present working of our own Department of Agriculture. Starting in 1839, as a division of the Patent Office, with an appropriation of \$1,000 for the purpose of collecting and distributing seeds, prosecuting investigations, and procuring statistics, it continued with this connection till 1862. Up to 1854 the annual appropriation had not reached \$6,000 in any one year; yet the reports published under the auspices of the Patent Office, up to that time, are valuable and creditable, considering the means and facilities for work then at command. By 1854 the work of the Patent Office had so stimulated agricultural enterprise that Congress that year appropriated the sum of \$35,000, and the present organization of the Department was fairly instituted. The annual reports from this time till 1862, when a separate Department of Agriculture was established, were most creditable, and the discussions and experiments in the reports prior to this time, on tea culture, corn-stalk sugar, &c., and the negative results that have come from them, are well worth pondering, in the light of recent sanguine claims for those proposed industries! The history of the department since that day is familiar to all, and, if popular verdict be a just criterion, the working of the institution has, for the most part, been disappointing. In the words of Senator A. S. Paddock, of Nebraska:

"This department, as at present organized, is a disgrace to our agriculture, and a reproach to the country. Hitherto in the popular estimation it has had no status except such as it has made for itself through its partial and unsatisfactory distribution of seeds, in answer to demands based rather upon political considerations than the exact interests of agriculture. Appropriations have been freely made for seeds, while scientific investigations in the interests of agriculture have, as a rule, been scoffed at, and, if not entirely ignored, they have been neglected by Congress."

To enumerate the many directions in which it has failed to keep abreast with the times—the golden opportunities for increased usefulness which it has lost—would extend my remarks beyond all reasonable limits and weary you. Suffice it to say, whether in the statistical, horticultural, chemical, botanical, entomological, or microscopical divisions, its work has been inferior to that in the same line by many private associations and State institutions, and has sometimes been of such a character as to seriously reflect upon the department. It has too often exhibited a want of knowledge of what other countries have done in special fields, and shown contempt for really scientific work.

The House Committee on Agriculture is now considering the question of making the Commissioner a Cabinet officer; but the efficiency of the department will not be increased by simply adding to the position and dignity of its head, without likewise reorganizing it as a whole. Whether or not agriculture should have a voice in the Cabinet counsels any more than other of our great industries is a matter of opinion; but there can be no question about reorganization. The bureau

should either be enlarged in the direction I have indicated with a supervisory board, or merged into a department of industry to be represented in the Cabinet, something after the plan proposed by Senator Windom, of Minnesota, in a bill introduced two years since, or after the plan of the French Government. At present it is an anomaly. There is much to be said in favor of elevating and broadening the scope of the department so that it shall be represented in the Cabinet by a Secretary who, with all the other Cabinet officers, will be expected to change with each administration; but the assistant secretary, who should occupy a similar position to the assistant secretaries in other departments, would, like them, be apt to remain from one administration to another, so that the retention of administrative experience would be insured, which is not the case at present.

Now, sir, I make these suggestions with no hostility to the bill. I am willing to test it thoroughly if such be the determination of the House. I have no wish that its success shall be uncertain. On the contrary, I am anxious that no mistake shall be made; and that the evident purpose of gentlemen to adopt this measure in some form shall receive that direction which shall establish the new department upon a basis favorable to the attainment of its ends, and thoroughly approved by the judgment of the country.

I propose, however, to vote for the substitute because it accepts from the committee every proposition they have reported. It alters nothing; it antagonizes no principle; it doubts the wisdom and expediency of no provision; and is ready to be conformed to whatever amendments the House may determine upon. It proposes, however, to go further and unite under one general supervision various branches of the public service between which, if the closest relations do not exist, there can be found nothing of hostility or disagreement.

I am at a loss to understand what new revelation has come to gentlemen that they discover in commerce the foe of agriculture. I have been under the impression that in every effort to trace the sources of national growth and power both the orator and the statesman always have spoken with pardonable enthusiasm of the two as the handmaids of prosperity, twin sisters, moving with joined hands and kindred purpose along the pathway of progress, the enterprise of the one supplementing the industry of the other. One, sir, need only raise his eyes in this Hall to discover among the emblazoned arms of the States a happy union of the emblems of them both—the bound sheaf and the ready ship, while the legend which interprets them is simply "Commerce and Agriculture," as if upon these two all the hopes of those who have erected great commonwealths were content to rest.

Neither do I understand that premature alarm which appals some gentlemen who proclaim that with such a union commerce will throttle her twin sister and debauch the authority which would be intrusted with the sacred custody of the interests of both. Pardon me, sir, if I dismiss such reasoning as simply sentimental. If there be anything in the experience of other nations which may guide us in our own policy, into what nothingness does this fancied idea of conflict between these two industries sink. Gentlemen have invoked examples and commended them to our consideration. For one, I welcome them. I learn that Hungary has its ministry of agriculture, industry, and commerce; France a department of agriculture and commerce; and Italy, to quote from my distinguished friend from Mississippi, [Mr. MULBROW,] "not unmindful of the source of greatness for every people, has her minister of commerce and agriculture."

Indeed, sir, the gentleman from South Carolina, [Mr. AIKEN,] who most strenuously objects to this proposed union, gives the additional examples of the Netherlands and Portugal as having each a department combining "navigation, agriculture, and commerce." I simply ask whether the commendable research made by gentlemen in regard to the policy of other countries has rewarded them with any information showing incongruity between the interests of commerce and agriculture, or establishing the conclusion that conflicts have arisen in which agriculture has suffered at the hands of commerce? I may venture to say, sir, that a harmony so natural and so logical has never been disturbed in any land or under any system of government.

Mr. Speaker, the substitute proposes to establish a department of industries. The name indicates the character of the proposition. What are the industries of the country? I count agriculture as the leading and controlling American industry. But commerce is equally an industry; trade, transportation, every agency which touches, moves, or adds value to the product of the soil is an industry. When his harvest has been gathered, and the fruit of a year's labor leaves the field or the barn and passes, for a price, into the hands of those who convey it to a market of purchase and consumption, the farmer need have no further concern. His labor has contributed to the aggregated values of the commonwealth, and he reaps the reward of his toil. As I have said, commerce comes to his door and undertakes, as its special office, to find a purchaser for every bushel of corn and wheat, every pound of cotton and tobacco.

Thus the industry of production is brought into direct relation to the industries of trade and transportation; for without production there can be no transportation, without transportation no trade, and without trade that intercourse and interchange of products with the rest of the world which constitute commerce must necessarily cease. So, sir, one easily perceives that the busy mart, the full storehouse, the laden ship, and all the returns and reciprocities of foreign trade, through an unbroken continuity, relate back to the harvest-field and the garner. There must be some point where agriculture and

traffic meet for bargain and sale; and at this point the closeness and necessity of their relations involve intimate and dependent conditions, because trade must know the quantity, quality, and locality of production, while agriculture cannot be safely ignorant of markets and prices, nor fail to comprehend the ever-present and all-controlling question of the extent of its own supply and that of the world's demand.

I turn from these general considerations, Mr. Speaker, to a question of practical legislation. It is known to gentlemen around me that, earnest and persistent as has been the appeal to Congress, the response to which is found in the bill before us, a demand equally earnest and pressing has been made for the establishment of a department of commerce as a co-ordinate branch of executive government. So far as I know—and looking to the history of the present Department of Agriculture I think I am not mistaken—the conclusion that the commercial interests of the country should be directly represented in the administration of the Government antedates the organized efforts which have resulted in the report of the bill of the Committee on Agriculture by nearly a score of years. In 1865, and again in 1868, the business men of the United States, represented in commercial conventions, urged the establishment of a department of commerce, "to which should be intrusted the general oversight of the commercial and other industrial interests of the country, including transportation on land and sea."

Of course, Mr. Speaker, I make no point against the pending bill by suggesting this question of seniority; I desire merely to rescue some gentlemen from the impression that this scheme is new to the business men of the country and, therefore, to be regarded with caution, if not suspicion. In fact a vindication of the wisdom of the plan proposed by the substitute may be found in measures repeatedly proposed to Congress, formerly by conventions of business men, and recently by that most important organization, the National Board of Trade. And more than once bills have been introduced looking to the establishment of a department of united industries; and it may possibly affect the conclusions of my friend from South Carolina [Mr. AIKEN] if I remind him that for years a similar demand has been made upon the Parliament of Great Britain, with what result will appear from the following extract from the proceedings of the associate chambers of commerce of England, (quoted in the transactions of our own National Board of Trade:)

Considering that the often repeated and unanimously voted resolution of this association in favor of the establishment of a ministry of commerce and agriculture has received the sanction of the House of Commons in 1879, and again in 1881;

Considering also, that the last of these resolutions was passed by the house without opposition and with the qualified approval of the government;

And that a step toward its realization has already been taken by extending the functions of the board of trade:

This association resolves, that while attaching no great weight to the name which may be given to the desired ministry, no arrangement will be satisfactory which does not give to the head of that department a seat in the cabinet, with a position equal to that of his colleagues, and the power of giving effect to the measures which he may propose in the interest of the great industries for which he is to be especially responsible.

And that, on the other hand, no scheme will be deemed satisfactory to the commercial and industrial community which would go no further than to divide the responsibility for the great wealth-earning industries between different departments already fully occupied with other legislative and administrative duties.

Now, sir, it is on behalf of the united "wealth-earning" industries of this country that the substitute is submitted to the consideration of Congress. Its theory is to make a new department especially responsible for all of these great industries, and to provide that the head of that department shall have a seat in the Cabinet equal in dignity to that of his colleagues; and its scheme repudiates any division of that responsibility between other departments already fully occupied with other duties. It is a strong and convincing coincidence that the necessities of the commercial and industrial interests of the two great Anglo-Saxon nations should find utterance in expressions of purpose and conclusion so nearly identical.

Possibly, Mr. Speaker, better than any comment or attempted explanation of mine the text of the substitute will speak for itself. The sixth section indicates very clearly the whole scheme; and I shall be pardoned for quoting it. It provides:

That all divisions and subdivisions, bureaus or parts thereof, heretofore attaching to the Treasury Department by virtue of the provisions of chapter 10 of title 7 of the Revised Statutes, relating to the Bureau of Statistics, which shall hereafter be known as the bureau of external commerce; title 48, relating to commerce and navigation; title 49, relating to the regulation of vessels in foreign commerce; title 50, relating to the regulation of vessels in domestic commerce; title 52, relating to the regulation of steam-vessels; title 56, relating to the coast survey; title 55, relating to lights and buoys; sections 4801, 4802, 4803, 4804, 4805, 4806, of chapter 1, title 59, relating to hospital relief for seamen; and chapter 265 of the acts of the Forty-fifth Congress, second session, relating to the Life-Saving Service, or by virtue of any law amendatory of said several provisions, or regulations in pursuance thereof, shall, from and after the passage of this act, be parts of the division of commerce in the department of industries; and the secretary of industries shall establish in said division of commerce a bureau of internal commerce, to be organized and governed as other bureaus in said division.

Whoever may take the trouble to examine the statutes which prescribe the service of the Treasury Department will discover how, as if marked by measured degrees, its added duties have declared the growth and progress of the country. The Departments of State, of War, the Navy, and the Post Office are specialties, as indicated by their titles. Prior to the establishment of the Interior Department nearly every new service was fastened upon the Treasury. Its origi-

nal functions—the custody of the public money, the regulation of imports, the control of all agencies employed in the collection of the public revenue—seem to have been reduced to secondary importance by the number of new and incongruous duties superadded to them. I violate no confidence when I say that from the Treasury itself has come the admission that out of this extension of its service have grown established offices not only not in accord but antagonistic in their purposes and mutually obstructive in their action.

The demands of to-day cannot be met by the provision of a century ago, however far-seeing and prophetic; and all executive and administrative functions must, upon some principle of logical expansion, comprehend and include the obligations which time, growth, progress, and development impose upon them. It is the office of statesmanship to perceive, if not to anticipate, these obligations; and that land is badly governed, Mr. Speaker, in which power shuts its eyes to the requirements of the present or seeks to meet them with the weak and inadequate resources of the past. Now, sir, because of progress and growth, agriculture demands of Congress an unqualified recognition of its relations to the advanced and developed condition of the country. Commerce, conscious that in this age no envious criticism may repeat the sneer—

Trade's proud empire hastes to swift decay—

appeals for equal recognition. Neither can be ignored; nor can either be wisely postponed to the chances and possibilities of the future. It is manifest, therefore, that these two appeals must be heard and determined; so manifest that the proposition takes this emphatic shape: shall Congress establish two new departments, one of agriculture, the other of commerce, or shall these two great interests be united upon every principle of economic and judicious expediency in one accordant and comprehensive whole? These are the inquiries directly presented by the substitute. It is for the House to determine them.

I have not undertaken, Mr. Speaker, to discuss elaborately the questions which the bill and the substitute so plainly suggest; my time is too limited to permit even a partial consideration of details. Still, I shall be pardoned if I ask the indulgence of gentlemen on every side for a few moments more. We have little difficulty under the provisions of existing laws in obtaining all necessary agricultural statistics in a form at least approximately correct. We encounter no obstacle when we seek information through the Bureau of Statistics, touching commerce with all the world, even to the farthest isles of the sea. And yet, with all the wealth—may I not say wantonness!—of provision made by Congress for the collection, tabulation, and digest of information upon a thousand and one subjects of doubtful interest and importance, the vast detail of our internal commerce, interstate traffic and transportation stand to-day without official recognition, executive or legislative. Were not gentlemen surprised by the statement made on yesterday by my colleague? Let me quote it:

I asked him [the chief of the Bureau of Statistics] where I could get certain information, in official form, with reference to the internal commerce of the country. He replied "You cannot find it at all. It is not gathered or collected in the form of statistics by the Government. * * * There is no existing provision for gathering the statistics of the internal commerce of this country whatever."

It is true that Mr. Nimmo has to a large extent supplied this needed information by a valuable work published upon his private responsibility; but he admits its incompleteness, and states that accurate statistics upon this important subject can only be obtained by the comprehensive machinery of official investigation.

Now, sir, we propose to meet this necessity; to supply this strange omission; to establish a bureau of internal commerce, which shall embrace every subject of inquiry, legitimately and logically, included in the broad range of investigation which its title indicates. The great question of transportation, in its relations to agriculture, is real and practical. It must be met. Every fact which affects it to any degree is important. Whether the products of the soil be borne to market by railway or canal, by river or by lake, it must be determined how they may reach the consumer without being subjected to inordinate and unjust tribute to monopoly. I do not venture to say in terms how soon or to what extent the relations of the carrier to the producer may be controlled by such an agency as the proposed bureau of internal commerce. I know, however, that the diffusion of reliable information upon any subject of interest and importance always precedes and enforces legislation necessary to the remedy of wrongs and the reform of admitted abuses. And I may say with no assumption of the mantle of prophecy, that so soon as accurate official and unassailable statistics shall establish the fact that corporate power has employed, or means to employ, its special franchises in efforts to wrong or oppress agriculture, legislation will assert its office and, by the force of enacted and executed law, interpose the shield of its protection.

I have not a purpose, as I have not the right, now to discuss the great questions involved in the bill introduced by the distinguished gentleman from Texas, [Mr. REAGAN.] But I desire to say, Mr. Speaker, that no one can be blind to the issues which that bill recognizes or the necessity of their determination by some form of judicious legislation. It is more than probable that no statute of control and regulation will be enacted by this Congress by the provisions of which the interests of production and transportation may be placed upon a plane of absolute equality. Apart from all other considerations

which might be presented, in detail, the single fact that no authenticated information upon this subject is before the country gives excuse for delay and palliates that opposition which has no other pretense for resistance than an affectation of ignorance. If, sir, it shall do nothing further, the bureau of internal commerce will remove this ground for postponement and inaction by securing accurate, complete, and reliable evidence of every fact and figure touching the relations which production bears to transportation.

I trust, sir, that it is unnecessary for those who believe that a field of important inquiry lies before us, whose harvest at no distant day shall ripen into a wise, matured, and impartial adjustment of these questions, to disclaim any sentiment of hostility or purpose of injustice to corporate franchises, honestly procured and fairly employed. No one who reflects upon the almost startling progress and development of our own day and generation can falter in his recognition of the degree to which they are due to the immense power of organized and associated capital. He who would strike down the great levers which move the world can make no claim to statesmanship. But it is to be remembered that the industry of the great body of the American people is single and isolated in its pursuit. The power of agriculture is individualized; it admits of no association; it is the hand of the one man, the unit of society, which guides the plow or swings the cradle into the billowy gold of the ripened harvest. In so far as he is an individual, or a unit, he lacks the protection which surrounds all forms of association and incorporation.

The organization of society, the erection of governments, the history and philosophy of combination and centralization, suggest ready illustrations of the idea I seek to present. For one, I would make no change in this. The preservation of the true spirit of American constitutional liberty can best be confided to the guardianship of a patriotism which attains its sturdiest and most reliable development in the strongly marked individual and personal characteristics of the American farmer. I make no mistake in saying this; for in all history, ancient or recent, the record is the same—the tillers of the soil have been its bravest defenders against invasion, and at the same time the most jealous champions of their own personal rights and individual privileges.

I can claim the attention of the House for only a moment more. A large majority of the constituencies represented upon this floor are agricultural. Upon them, the lands they own and cultivate, rest in one form or another the great burdens of taxation. Be it by impost duties or through the oppressive requirements of an internal-revenue system, no one doubts where the heavy hand of the tax-gatherer falls. I beg leave to ask, will those who represent these constituencies deny their support to a measure which, giving to agriculture the fullest recognition, goes further and seeks to secure in the only practicable mode its absolute equality with every other industry and pursuit? It is not for me to advise gentlemen or to warn them. But I may say without impropriety that if the bill of the Committee on Agriculture shall fail to become a law, and if for years, awaiting the slow progress of legislation, the great interests intrusted to their care do not obtain the recognition they seek, and more positive difficulties and complications ensue and increase in measure because of the undetermined relations of which I have spoken, the responsibility will not rest upon those who support the substitute of my colleague.

It will be theirs, however, who will not realize the necessities of the present or comprehend the demands of the future; who assert antipathies which do not exist; who protest against a union which the wisdom of all countries has approved; who, in a word, separate commerce and agriculture, and deny to the country the rich fruition of results which must follow from a sympathy as natural and accordant as that which would organize these great interests into one consistent and exhaustless source of national wealth and progress.

APPENDIX.

Substitute to House bill No. 4429 proposed by Mr. KENNA, of West Virginia.

Be it enacted, &c., That there shall be at the seat of Government an executive department to be known as the department of industries, and a secretary of industries, who shall be the head thereof.

SEC. 2. That there shall be in the department of industries a division of agriculture, and to superintend said division a commissioner of agriculture, who shall be a practical agriculturist, and who shall be appointed by the President, by and with the advice and consent of the Senate, and who shall be entitled to receive a salary of \$5,000 per annum.

SEC. 3. That for the purpose of collecting and disseminating all important and useful information concerning agriculture, and also concerning such scientific matters and industrial pursuits as relate to the interests of agriculture, the secretary of industries shall organize the following bureaus in the division of agriculture, namely:

First. The bureau of agricultural products, which shall include divisions of botany, entomology, and chemistry, and the chief of which bureau, who shall be a practical agriculturist, shall investigate the modes of farming in the several States and Territories, and shall report such practical information as shall tend to increase the profits of the farmer respecting the various methods, the crops most profitable in the several sections, the preferable varieties of seeds, vines, plants, and fruits, fertilizers, implements, buildings, and similar matters.

Second. The bureau of animal industry, to be in charge of a competent veterinary surgeon, who shall investigate and report upon the number, value, and condition of the domestic animals of the United States; their protection, growth, and use; the causes, prevention, or cure of contagious, communicable, or other diseases, and the kinds, races, or breeds best adapted to the several sections for profitable raising.

Third. The bureau of lands, the chief of which shall investigate and report upon the resources or capabilities of the public or other lands for farming, stock-raising,

timber, manufacturing, mining, or other industrial uses. And all powers and duties vested in the commission now known as the Geological Survey, together with all clerks, employés, and agents, and all instruments, records, books, papers, &c., are hereby transferred to the department of industries. And the secretary of industries shall institute such investigations and collect and report such information, facts, and statistics relative to the mines and mining of the United States, and facilities for their ventilation and general operation, as may be deemed of value and importance.

SEC. 4. That in addition to the duties imposed by chapter 10, title 7, of the Revised Statutes, the secretary of industries shall cause to be collected and report the agricultural statistics of the United States; and, in addition, all important information or statistics relating to industrial education and agricultural colleges; to labor and demands and prices therefor in this and other countries; to markets and prices; to modes and cost of transporting agricultural products and live stock to their final market; to the demand, supply, and prices in foreign markets; to the location, number, and products of manufacturing establishments of whatever sort, their sources of raw material, methods, markets, cost of transportation, and prices; to such commercial or other conditions as may affect the market value of farm products or the interests of the industrial classes of the United States. And the secretary is hereby authorized to establish such divisions in this bureau and to make such monthly or other reports as he shall deem most effective for the prompt dissemination of such reliable information respecting crops and domestic and foreign markets as will be of service to the farmers, miners, mechanics, laborers, or other industrialists of the United States.

SEC. 5. That there shall be in the department of industries a division of commerce, and to superintend said division a commissioner of commerce, who shall be appointed by the President, by and with the advice and consent of the Senate, and shall receive a salary of \$5,000 per annum.

SEC. 6. That all divisions and subdivisions, bureaus or parts thereof, heretofore attaching to the Treasury Department by virtue of the provisions of chapter 10 of title 7 of the Revised Statutes, relating to the Bureau of Statistics, which shall hereafter be known as the bureau of external commerce; title 48, relating to commerce and navigation; title 49, relating to the regulation of vessels in foreign commerce; title 50, relating to the regulation of vessels in domestic commerce; title 52, relating to the regulation of steam-vessels; title 56, relating to the coast survey; title 55, relating to lights and buoys; sections 4801, 4802, 4803, 4804, 4805, and 4806 of chapter 1, title 59, relating to hospital relief for seamen; and chapter 265 of the acts of the Forty-fifth Congress, second session, relating to the Life-Saving Service, or by virtue of any law amendatory of said several provisions or regulations in pursuance thereof, shall, from and after the passage of this act, be parts of the division of commerce in the department of industries; and the secretary of industries shall establish in said division of commerce a bureau of internal commerce, to be organized and governed as other bureaus in said division.

SEC. 7. That all duties devolving upon the Secretary of the Treasury by virtue of the several provisions mentioned in the preceding section shall, from and after the passage of this act, be performed by the secretary of industries. The authority conferred and the duties imposed by said several provisions upon the Register of the Treasury shall, from and after the passage of this act, be exercised and discharged by the commissioner of commerce. All bonds authorized by any of the provisions aforesaid to be made payable to the Register of the Treasury shall, from and after the passage of this act, be made payable to the commissioner of commerce.

SEC. 8. That section 158, title 4, of the Revised Statutes is hereby amended by adding at the end thereof the words: "Eighth. The department of industries."

SEC. 9. That this act shall not be construed to interfere with the present organization of the various departments, divisions, subdivisions, and bureaus embraced herein, except with reference to the transfer thereof to the department of industries, subject to the general provisions of law relating to regulations in the various departments of the Government and appointments to office therein.

SEC. 10. That all acts and parts of acts inconsistent with this act are hereby repealed.

Rivers and Harbors.

The Mississippi River: Congress has the constitutional power to make appropriations for the threefold object of improving its navigation, affording ease and safety to commerce, and protecting its alluvial basin from destructive floods.

SPEECH

OF

HON. NEWTON C. BLANCHARD,

OF LOUISIANA,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, June 6, 1882,

On the bill (H. R. No. 6242) making appropriations for the construction, repair, and preservation of certain works on rivers and harbors, and for other purposes.

Mr. BLANCHARD said:

Mr. SPEAKER: It is my purpose at this time to confine myself to a discussion of that part of the bill under consideration which relates to the Mississippi River and appropriates for its improvement the sum of \$4,923,000, to be "expended by the Secretary of War in accordance with the plans, specifications, and estimates, and under the supervision of the Mississippi River commission."

In view, sir, of the bitter experience through which the people, or a large number of the people, of the State which I have the honor to represent in part on the floor of this House have just passed, in respect to the inundation which recently swept over their country—a calamity as appalling in contemplation of the human and animal suffering, woe, and death which it entailed, as it was potential in the destruction of property estimated and considered in the sense of a diminution of the aggregate of national wealth—in view, I say, of this experience, of the mournful array of incontestable facts constituting it, and considering the deep interest which the people of my State might naturally be expected to take in the question under consideration, I trust I will be pardoned for asking the indulgence and

attention of the House while I submit some observations in support of the appropriation alluded to.

The wisdom of Congress should be invoked to devise some plan by which that great river shall cease to be a terror to those who dwell upon its banks, and by which its shipping may safely carry the industrial products of twenty-five millions of people.

So spoke James A. Garfield, late President of the United States, in his letter of July 10, 1880, accepting the nomination for the Presidency conferred upon him by the Republican party. He reminded the country that in order to secure to the nation the control of the Mississippi and its tributaries, President Jefferson had negotiated the purchase of a vast territory extending from the Gulf of Mexico to the Pacific Ocean.

Prior to that utterance, from his place as a Representative upon this floor, he had declared that he believed that one of the grandest of our material national interests, one that is national in the largest material sense of that word, is this great river and its tributaries. His broad and liberal comprehension enabled him to grasp the mighty subject, for he pronounced it "the most gigantic single natural feature of our continent, far transcending the glory of the ancient Nile, or of any other river on the earth." With prophetic vision he foresaw that its vast and growing interests would make themselves heard and felt, for he realized in anticipation that "the statesmanship of America must grapple the problem of this mighty stream;" that "it is too vast for any State to handle; too much for any authority less than that of the nation itself to manage."

Sirs, in view of the recent bitter experience in the valley of the great stream, the time has come when the liberal-minded statesmanship of the country must rise equal to the emergencies of the hour, and "devise a wise and comprehensive system that will harness the powers of this great river" to the preservation and development of the material interests of the country, and no longer permit the same, in unrestrained fury and wilder license, to spread havoc, ruin, desolation, destruction, and despair over one of the very fairest portions of this boasted land of freedom and progress.

President Hayes, in his message of December, 1880, speaking of the Mississippi and its tributaries, said:

These channels of communication and interchange are the property of the nation. Its jurisdiction is paramount over their waters, and the plainest principles of public interest require their intelligent and careful supervision, with the view to their protection, improvement, and the enhancement of their usefulness.

Here, then, are presented the opinions on this subject of the two Presidents of the Republic who immediately preceded the present occupant of that chair. Both avowedly went beyond the mere question of the improvement of the navigation of the river. Both had in their minds, when giving utterance to the sentiments quoted, the ultimate idea of affording protection to those who dwell upon its banks, as well as offering greater facilities to the immense commerce borne upon its bosom.

The present Executive, in his message of April 17, 1882, went yet a step further, and openly and expressly proclaimed the duty of Congress in the premises, when he said:

The immense loss and widespread suffering of the people dwelling near the river induce me to urge upon Congress the propriety of not only making an appropriation to close the gaps in the levees occasioned by the recent floods, as recommended by the commission, but that Congress should inaugurate measures for the permanent improvement of the navigation of the river and security of the valley.

Mr. Speaker, these utterances of three successive Executives of the Union evidence the progress of the public opinion of the country in regard to this matter. That any considerable portion of the people of the Union are willing to indifferently witness the spectacle of the periodical overflow of the Mississippi, the suffering and woe entailed thereby, and the destruction of values, present and prospective, resultant therefrom, is not to be entertained for an instant. The affirmance of the proposition would be an insult to the civilization, the development, the progress, the conservatism of the country.

This great nation, with its fifty millions of people, its wonderful history, its immense wealth, its unparalleled resources, its prodigious enterprise, its onward march in all that constitutes greatness, glory, and power, cannot afford to permit the devastation of its fairest and most productive provinces by the great stream which God intended as a blessing, but which has often, and but too recently, shown its potency as an engine of destruction, and this because of man's failure to use the means at his command for the restraining of its fury.

NON-SECTIONAL IN CHARACTER—NATIONAL IN EXTENT.

When, in 1803, Napoleon Bonaparte consented, on behalf of France, to Mr. Jefferson's proposition for the purchase of the Louisiana territory, he is said to have remarked:

To emancipate nations from the commercial tyranny of England it is necessary to balance her influence by a maritime power that may one day become her rival; that power is the United States. The English aspire to dispose of all the riches of the world. I shall be useful to the whole universe if I can prevent their ruling America as they rule Asia. They shall not have the Mississippi which they covet.

And when informed that the treaty of sale to the United States was consummated, he said:

This accession of territory strengthens forever the power of the United States, and I have just given to England a maritime rival that will sooner or later humble her pride.

He foresaw that the nation which controlled the territory drained by the Mississippi and its tributaries would hold the key to America,

and discerned that the immense possibilities offering in the development of that wonderful country must, when realized, make its possessor rich, great, and powerful. We have, as a nation, relatively reached that point already, but nothing compared to what we shall as, in the providence of God, the great work of development goes on.

An important step in that work of development is the protection of the richest portion of the great country acquired by the treaty with France from the angry floods of the mighty river whose outlet into the Gulf we gained control of by the acquisition aforesaid.

Mr. Calhoun, in 1845, likened the Mississippi and its tributaries to an inland sea. Said he:

Regarding it as such, I am prepared to place it on the same footing with the Gulf and Atlantic coasts, the Chesapeake and Delaware Bays, and the lakes, in reference to the superintendence of the General Government over its navigation. It is manifest that it is far beyond the power of individuals or of separate States to supervise it.

Who doubts, if he were here to-day, he would raise his voice in advocacy of the General Government taking that step, germane to the improvement of the navigation of the river, and certainly essential to the development of its great interests, namely, the protection of the adjacent country from the periodical overflows of a national highway. Individuals and separate States can no more handle this question of the prevention of inundation than they can the supervision and effectuation of systematic works of improvement of the navigation of the river.

As has been well said, "the legitimate sphere of the Mississippi is the field of national commerce." So it is that the improvement of its navigation and the construction of works needful to restrain its floods within its channel are the province of the National Government.

Nineteen States, Mr. Speaker, and three Territories have a direct business interest in the river system formed by the Mississippi and its tributaries, and all the other States and Territories have an indirect interest. This system furnishes a connecting link between internal and international commerce. Considered as a drainage system, it extends through nearly the whole length of the United States, from Canada to the Gulf, and across more than half its width, or from the summit of the Rocky Mountains to the summit of the Alleghanies. Of the many divisions and subdivisions of the river, two hundred and forty are considered of sufficient importance to be named upon the river map in Walker's Statistical Atlas of the United States; and probably as many more streams of minor importance are omitted from the map.

Steamers can now transport freight in unbroken bulk from Saint Anthony's Falls to the Gulf of Mexico, a distance of 2,161 miles, and from Pittsburgh to Fort Benton, Montana, 4,333 miles. Lighter craft can ascend the Alleghany, an extension of the Ohio River, to Olean, New York, 325 miles above Pittsburgh, and up the Missouri to Great Falls, near where that river leaves the Rocky Mountains. The total present navigation of these rivers is about sixteen thousand miles, more than four times the length of the ocean line from New York to Liverpool, and more than four times the distance by rail across the continent from New York to San Francisco.*

Estimating the length of the numerous non-navigable streams which flow into the Mississippi and its tributaries—including that portion of the navigable streams above the highest point of navigation attainable—as equal to the total navigable length of the rivers, and we have an aggregate length of water-way of 32,000 miles, draining, gathering, receiving, concentrating, pouring its accumulation of floods through the parent trunk into the Gulf.

Should we wonder, then, that in seasons of high water the great river labors and travails and groans under the effort imposed upon it by nature of discharging this superabundance of water into the sea? Should we be surprised that it often finds itself unable to do this with safety to the millions of dwellers upon its alluvial banks? Should we hesitate to assist nature in the performance of the great work?

The skillful physician, when called to treat the maladies afflicting the human system, directs his remedies to enabling nature to throw off that which occasions the trouble, to reassert its normal sway over the functions of the body, that they may perform, unclogged, undisturbed, their regular duties so essential to health and life.

Should we not treat this great river system in the same way? Should we not aid it in the performance of its double duty, namely, affording a safe highway to the commerce of the country, and discharging safely the waters drained into it from the territory comprising more than half the Union?

But we are told, Mr. Speaker, that this great nation, with its fifty millions of people, its resources, its wealth, its enterprise, can only aid the rivers in the performance of the first-named duty; that the power given Congress to regulate commerce among the States justifies only appropriations made solely for the improvement of navigation; that it does not warrant appropriations made to assist the great rivers in the performance of their other great function, the safe discharge of floods.

We are told we must stop short with appropriations—meager at best—for the first purpose; that Congress should not, must not, cannot, dare not rise equal to the occasion and appropriate large

* The Mississippi and Tributaries, a statistical and commercial review, by Alex. D. Anderson.

sums to prevent the pauperizing of millions of the inhabitants of the country; to prevent the scenes of suffering, woe, desolation, destruction, and death lately witnessed in the overflowed sections; to assist in the great work of development of that section and keeping it abreast with the progress of the other sections—in other words, to protect the alluvial valleys from periodical overflow.

Sir, I scout such an idea. It is the offspring of a halting, narrow-minded, and illiberal policy. It is antagonistic to the spirit of progress which is gradually pushing this Republic ahead of the most enlightened and powerful nations of the Eastern Hemisphere. It is not in accord with our vaunted civilization and the advanced views held by us on all the great questions affecting the human race, its advancement, development, welfare, prosperity, and happiness. It is inconsistent with the treatment accorded by the Government to other sections and other industrial interests of the country.

Here are great valleys subject to inundation, and actually threatened by that danger with relegation to the primeval condition of swamps and wildernesses. With proper protection and development these valleys are capable of becoming the granaries of the world, for they have scarcely an equal and no superior for the production of corn, rice, wheat, oats, cotton, and sugar. The interest affected is an agricultural one, and accordingly the relief asked, if granted, would be a protection to the agricultural interests of the country.

And yet, sir, there are gentlemen on this floor who are unwilling to extend this protection, others who are in doubt as to how they should vote on this question; but, sir, when it comes to extending protection to that other great interest of the country, to wit, the manufacturing interest, by a high tariff upon imports of manufactures from abroad, their duty lies clearly before them, and no harassing doubts arise to vex or disturb their minds. Let a proposition be submitted here for the repeal of the tariff laws, and the consequent striking down of the protection now and for years enjoyed by the manufacturing interests, and a hundred eloquent tongues would sound, and have during this session sounded, in trumpet tones, the key of alarm. The changes would be rung upon it, the refrain would be caught up by the protectionist press of the country, it would be re-echoed from ten thousand hill and mountain tops and go reverberating down the valleys and over the plains of the country.

How many millions of dollars have gone to swell the coffers and fill the vaults of the manufacturing interests of the country by this system, building them up and making them great and strong! Sir, if the amount were to be stated, so enormous would it be that to believe it would be honoring a large draft on one's credulity. It is true that this money has not gone directly out of the Government Treasury to the building up of the manufacturing interest, but it has been paid to that interest by the people of the country—who are the Government, at last, in the sense that in them is vested the sovereignty—in the shape of increased prices on the products of manufacture. The difference is but small. Indeed, it is a distinction almost without a difference to say that the Government did not pay it, but, forced by the protective-tariff laws, the people did.

Mr. Speaker, I voice the agricultural interest of the valleys of the great river and its tributaries when I implore this Congress to do equal and exact justice to all. That interest—the agricultural interest—pointing to what has been done by the Government for the manufacturing interest, may well ask what of a compensating or equivalent nature has been done for it. Where the benefit (speaking for the whole country) anything like equal, conferred upon it? Sirs, it does not exist.

Every country, Mr. Speaker, having any pretensions to agriculture at all can have no greater interest. It is a great civilizer. In proportion as agriculture has advanced and developed in the universe, in like ratio has mankind become progressive, civilized, enlightened. It seems to furnish that occupation producing the conditions best adapted for advancement in civilization.

Already has this Government delayed too long in furnishing a greater degree of fostering care to that industry. And now that it has the best of pretexts for so doing, if pretext were needed; now that the urgency upon it is so great; now that the full details of the late terrible scenes of suffering and destruction are fresh before it, let it not withhold its hand. Let it put it forth with sufficient might and power to result in the construction of such works of improvement and protection as will suffice to control the rising floods of angry waters, and thus, in humble and reverential imitation of the Divine Teacher of Galilee, say to them, "Peace, be still."

INVASION OF AN ENEMY.

An enemy invades us. Our people fly to arms. Points of defense are strengthened. The eye of strategy selects other points to be fortified and defended. Congress votes the money, and immediately long lines of breastworks guard our frontier where attack is apprehended.

But, sir, here is an enemy who comes in the form of raging waters, sweeping down in resistless might from the North upon the sunny valleys of the West and South, bringing devastation, destruction, death. He raids through the country, rioting in ruin, and millions, panic-stricken, flee at his approach, leaving their all to be swallowed up in the wild vortex of destruction. The wasting presence lasts but a couple of months, but in that time there has been a destruction of property, present and prospective, estimated by competent

authority to equal in value fifty millions of dollars. In other words, the aggregate of our national wealth has suffered diminution to that extent by one overflow.

But that is not all. Worse than the destruction of property is the effect left upon the people of that unhappy section by the flood. They are rendered in a manner spiritless; have no heart to go back to their old homes and attempt the sad task of building them up again, of once more putting their houses in order, of making glad again the waste places. They know not how soon the destroying presence may be again upon them, how soon they may be again called upon to witness the sad spectacle of the destruction of their hopes, their firesides, their all, and placed in that condition of mind to exclaim, with the wise man of old, "All is vanity, vanity!" Dread, apprehension, anxiety, doubt distract them, blighting their energies, relaxing their nerves, disheartening them, staying their hands, retarding their enterprise, clogging their progress.

This, Mr. Speaker, is their condition, and must continue to be unless the voice of hope, of reassurance, of aid, issues forth from this Congress to them, infusing renewed life, vigor, buoyancy, spirit in them by sounding the end of their troubles in the decree that the National Government will undertake the great work of protecting their country from the invasion of waters, of rebuilding their levees, ay, more, of perfecting the levee system so as to restrain the floods within their natural channels.

This do, Mr. Speaker, and once more will that lovely country—but for the floods fit to have been selected as the original Garden of Eden—blossom again as the rose; again will its soil of wonderful fertility bring forth seeds sown in its bosom "an hundred-fold;" again will teeming, busy millions find secure and happy homes there; and again will thousands of sturdy immigrants, fleeing from the overcrowded provinces and marts of the Old World, seek settlements within its borders.

Let Congress say to these people that even as we would erect breastworks on our frontier to repel the threatened invasion of a warlike foe, so will we build levees along the great river to beat back its surging waters, threatening destruction well-nigh equal to what a human enemy could inflict.

But, it may be argued, the delegation of power to Congress to "repel invasions," "to protect the States against invasion," has reference to a human foe. I grant that that is the usual and ordinary meaning or significance given to the term, and it is likely that the framers of the Constitution had in contemplation a human foe when they inserted that clause. The connection, too, in which it is used gives additional weight to that argument. But still, the power conferred by the words "repel invasions," by the clause, "The United States" "shall protect each of them (the States) against invasion," is a general one, and might well and reasonably include defending the country against danger or harm of any kind.

Suppose, sir, some monster, like the fabled dragon of ancient times, were to rise up out of the deep and invade the land, spreading devastation, destruction, pestilence, and death around him. Does any one doubt the constitutional power and duty of Congress to "repel" his invasion, to bring the strong arm of the Government to bear against him, to make war upon, and kill and destroy him? I think not. And yet, sir, there are gentlemen on this floor who deny to Congress the power to "repel" the invasion of waters, to throttle this monster of inundation whose periodical visitation of the fairest portion of our country is but the recurring occasion for a perfect carnival of waste, ruin, rapine.

It is the duty of Congress to protect the States, or any one of them, against invasion. By "invasion" is meant against harm or danger to the government, the people, the country, threatened by an enemy. An enemy is only to be dreaded because of the suffering, destruction, death he may inflict. Judged by that standard, was not the recent great overflow in the alluvial basin of the Mississippi "an enemy?" None will deny its potency as an engine of suffering, destruction, and death. Why, then, cannot Congress under this clause of the Constitution protect the Valley States against a recurrence of this "invasion" of waters?

Again, it is made the constitutional duty of Congress to protect each of the States, under certain conditions, against "domestic violence." Why not against the violence of domestic waters? I say "domestic waters" for the reason that it is a fact that all the water which seeks an outlet to the sea through the Mississippi is the drainage of the territory of the United States, and in that sense is domestic, as pertaining to home; not foreign.

REGULATING THE PROPERTY OF THE UNITED STATES.

The Constitution (article 4, section 3) provides:

That Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States.

In the Gratiot case (14 Peters, 537) the Supreme Court of the United States, construing the above clause, said:

The term territory, as here used, is merely descriptive of one kind of property, and is equivalent to the word lands. And Congress has the same power over it as over any other property belonging to the United States; and this power is vested in Congress without limitation.

In the case of McCulloch vs. Maryland (4 Wheaton, 422) the Chief-Justice, as the organ of the court, speaking of this clause of the Constitution and the powers of Congress growing out of it, applies

it to Territorial governments, and says all admit their constitutionality. Story says, (volume 2, page 228:)

No one has ever doubted the authority of Congress to erect Territorial governments within the territory of the United States, under the general language of the clause, "to make all needful rules and regulations."

He continues:

The power is not confined to the territory of the United States, but extends to "other property belonging to the United States;" so that it may be applied to the due regulation of all other personal and real property rightfully belonging to the United States. And so it has been constantly understood and acted on.

Now, then, if the Mississippi is the property of the General Government, it is as much subject to "regulation" as the landed property or territory of the United States. And this power to regulate includes curbing, controlling, restraining the river within its own proper metes and bounds by means of levees, dikes, or other works, as Congress may, in its discretion, see proper to adopt; for, in the language of the Gratiot case, "this power is vested in Congress without limitation."

But it may be denied that the Mississippi River is the property of the United States in the sense that Congress may, under the power to regulate, direct the construction of works to restrain its waters within their proper channel. Mr. Speaker, the Mississippi River is a great

NATIONAL HIGHWAY.

It belongs as much to the United States as would a great trunk line of railroad that had been constructed, stocked, and was being operated by the Government. In the act of Congress enabling the people of Louisiana to form a constitution there is a provision that the State convention shall "pass an ordinance providing that the river Mississippi and the navigable rivers and waters leading into the same, or into the Gulf of Mexico shall be common highways, and forever free, as well to the inhabitants of the said State as to other citizens of the United States." And in the act for the admission of Louisiana, the above provision as to the navigation of the Mississippi is made one of the fundamental conditions of the admission. Similar conditions were likewise imposed upon the admission of the States of Mississippi, Missouri, and Arkansas.

In the case of *The United States vs. The New Bedford Bridge* (1 Woodbury & Minot's Reports, 421) Mr. Justice Woodbury used the following language:

For purposes of foreign commerce, and of that from State to State, the navigable rivers of the whole country seem to me to be within the jurisdiction of the General Government, with all the powers over them for such purposes (whenever they choose to exercise them) which existed previously in the States, or now exist with Parliament in England.

In the case of *Cortfield vs. Coryell* (4 Washington Circuit Court Reports, 379) Mr. Justice Washington said:

The grant to Congress to regulate commerce on the navigable waters belonging to the several States renders those waters the public property of the United States for all purposes of navigation and commercial intercourse, subject only to Congressional regulation.

And in the case of *Gilman vs. Philadelphia* (3 Wallace, 724) it was said:

The power to regulate commerce comprehends the control for that purpose, and to the extent necessary, of all the navigable waters of the United States which are accessible from a State other than those in which they lie. For this purpose they are the public property of the nation, and subject to all the requisite legislation of Congress. This necessarily includes the power to keep them open and free from any obstruction to their navigation, interposed by the States or otherwise; to remove such obstructions when they exist, and to provide by such sanctions as they may deem proper against the recurrence of the evil, and for the punishment of offenders. For these purposes Congress possesses all the powers which existed in the States before the adoption of the national Constitution, and which have always existed in the Parliament in England. It is for Congress to determine when its full power shall be brought into activity, and as to the regulations and sanctions which shall be provided.

It cannot, therefore, be doubted that the river, for all practical purposes, is the property of the General Government, and subject to its "regulation," whether as respects prescribing rules for governing the commerce and traffic which make use of it as a highway or as respects controlling it in the sense of denying the dominion and jurisdiction of the States or other powers, or as respects preventing the river from rising up out of its customary channel and spreading over the country. It is true, the banks of the river and the soil under the river belong respectively to the owners of the soil adjacent to the river, but no one will deny to the General Government the right to make use of the banks and soil in the erection of the works requisite to the proper "regulation" of the river for all useful purposes. Should, however, this right be questioned, there can be no doubt of the power of the Government, in the exercise of the prerogative of eminent domain, to expropriate whatever may be needed for the proper "regulation" of the river. The law on this subject is universally recognized as laid down by Bynkershoek, that "this eminent domain may be lawfully exercised whenever public necessity or public utility requires it."

It may be objected by some, Mr. Speaker, that should the Federal Government provide the ways and means for the construction of a levee system for the protection of the alluvial valley of the river, and as an adjunct to the improvement of its navigation, inasmuch as these levees will have to be constructed on the banks over which the jurisdiction of the States respectively extend, contention may arise between the State government and the National Government on this point; that the State government might deny

the right of the National Government to control the levees, to protect them after constructing them, and that the question thus raised may become a fruitful source of trouble between the sovereignty vested in the State and that reposing in the Federal Government.

I am not one of those who apprehend that any trouble on this score would ever arise, but as a precautionary measure Congress might, if it sees fit, after having determined upon a levee system, enact that there should be no expenditure of money for such purpose within the territorial limits of a State until the State shall have ceded to the National Government the right to control and protect the public works to be constructed.

The State, Mr. Speaker, which I have the honor to represent in part on the floor of this House, has already led off in that direction. In the constitutional convention of Louisiana which convened in 1879, and which framed the organic law under which that State is now governed, I, as a member of the convention and as chairman of its committee on federal relations, acting on the suggestion of my colleague from the sixth district of Louisiana, [Mr. ROBERTSON,] then chairman of the Committee on Levees and Improvements of the Mississippi of this House, reported to the convention the following ordinance, which was adopted and now stands as part of article 215 of the constitution of 1879 of Louisiana, to wit:

The Federal Government is authorized to make such geological, topographical, hydrographical, and hydrometrical surveys and investigations within the State as may be necessary to carry into effect the act of Congress to provide for the appointment of a Mississippi River commission for the improvement of said river from the head of the passes near its mouth to the headwaters, and to construct and protect such public works and improvements as may be ordered by Congress under the provisions of said act.

Under this article full authority is given the National Government to construct such public works along the Mississippi as Congress may see fit to order, and the control of same, after their construction, is ceded to the National Government.

Sir, the State of Louisiana, in incorporating this grant of authority in her organic law, recognized what is now generally conceded, namely, that there is no power competent to handle the questions presented by this great river except that of the Federal Government. No State can do it:

First. Because the work is too vast, too costly for any State through which the river runs to undertake it.

Second. Because any State attempting it would be circumscribed by its own territorial limits.

Third. Because the river, being the property of the United States, Congress alone has power under the grant to "make all needful rules and regulations respecting the territory or other property belonging to the United States," to say what works shall be done or plans adopted for its regularization.

Let us see as to this last proposition. Suppose the people living along the river, or the States, were to take in hand this matter of protecting the alluvial lands from overflow, and were to determine that the best mode of affording protection would be to create outlets. Could they construct these outlets in the sense of having the legal or constitutional right or power to do so? Might they not thereby effectually destroy the great stream for navigable purposes? The admission of the right to create one outlet carries with it the right to create a thousand, which might so dissipate and scatter the waters of the river as to leave no navigable channel at all.

Has any individual, or association of individuals, or State, or States, the right to destroy that river for navigable purposes? Or rather is it not the property of the nation to that extent that its navigation cannot be interfered with, much less destroyed? Could not and would not the General Government, therefore, stop such attempts, such works as might destroy, or at least endanger the navigation of the river? But could it, with any show of right or reason, do so without itself undertaking to protect the property and lives of the people from the dangers of overflow?

If you admit the right of the people, or States, to do acts looking to protecting the country from inundation, you must admit also their right to adjudge what is best to be done to so protect the country. And, as heretofore shown, the admission of this right might involve the destruction of the navigation of the great river. Now, if the people or States have not this right, or are restrained from exercising it, it would appear *ex necessitate rei* that not only is this right vested in the Government of the United States but that it is likewise its plain duty to exercise it.

It has often been held, and for years considered settled, that the power to regulate commerce includes the regulation of navigation. Now, the power to regulate navigation includes just as logically the power to prevent the destruction of navigation. Says Mr. Justice Curtis, in *Cooley vs. Board of Wardens of Philadelphia* (12 Howard, 319:)

Whatever subjects of this power are in their nature national, or admit only of one uniform system or plan of regulation, may justly be said to be of such a nature as to require exclusive legislation by Congress.

And in *Gibbons vs. Ogden* (9 Wheaton, 209) the court held that the power to regulate implies in its nature full power over the thing to be regulated, and excludes necessarily the action of all others that would perform the same operation on the same thing.

POST-OFFICES AND POST-ROADS.

Under the authority "to establish post-offices and post-roads" the Government of the United States has established thousands of the

former in the alluvial valleys of the Mississippi and its tributaries, and provided a perfect net-work of the latter. Daily over thousands of miles of roadway and railway and water-way in the great valley is the United States mail carried, supplying innumerable post-offices and affording facilities indispensable for the dissemination of intelligence, for the diffusion of the market reports, the weather reports, the crop and commercial reports, and the news generally, so absolutely needed for the welfare, the happiness, and the prosperity of the people, and the country.

Millions of money, besides great labor and much valuable time have been expended in building up and perfecting this system, which, in the normal state of the country, moves with the precision, ease, and regularity of well-ordered machinery. But periodically the great river swells up out of its banks and becomes a great inland sea, producing an abnormal condition of affairs, and disarranging, stopping, destroying for the time being the postal service, the transportation and delivery of the mails.

On our statute-books, as the enactments of Congress, stand stringent penal laws denouncing penalties against any and all who shall willfully impede, interfere with, or stop the mails; and the courts of the United States hold sittings all over the valley to enforce these laws. But here is a great convulsion of nature, as it were, that stops not one mail but a thousand; that breaks up not one post-office but hundreds; and against which the courts and the criminal laws for the protection and security of the mails avail nothing. But to prevent a recurrence of this is the strong arm of the Government powerless? No. Scientific, wise, experienced men, who have made a study of the river and its phenomena, of the laws of its currents, and of the conditions that affect it, say no! They have pointed out how these destructive floods can be avoided, and thus how the mails of the United States, their carriage and delivery, can be protected.

Now, then, does any one doubt that from the authority "to establish post-offices and post-roads" flows not only the power but the duty to protect them? No reasonable man can doubt it. No lawyer will hesitate for an instant to declare that the power to protect is incidental to the power to establish. The constitutionality of the laws denouncing penalties against the stoppage of or interference with the mails has never been doubted. Yet they were enacted for the protection of the mails, and depend for their validity upon the power to protect being incidental to the power to establish. Says the Supreme Court of the United States, in 4 Wheaton, 417:

To establish post-offices and post-roads:

This power is executed by the single act of making the establishment. But from this has been inferred the power and duty of carrying the mail along the post-road from one post-office to another. And from this implied power has again been inferred the right to punish those who steal letters from the post-office or rob the mail. It may be said with some plausibility that the right to carry the mail and to punish those who rob it is not indispensably necessary to the establishment of a post-office and post-road. This right is indeed essential to the beneficial exercise of the power, but not indispensably necessary to its existence.

Yet no one doubts or denies the right or power of the Government to punish the robber of the mails. Now, then, is it not just as legitimate, just as constitutional, to protect against the ravages of the waters as against the knavery of the robber?

TO REGULATE COMMERCE.

The power of Congress to regulate commerce includes the regulation of intercourse and navigation.—18 Howard, 421.

Says Story, (volume 2, page 4):

Commerce undoubtedly is traffic; but it is something more. It is intercourse. It describes the commercial intercourse between nations and parts of nations, in all its branches, and is regulated by prescribing rules for carrying on that intercourse.

This power to regulate commerce is a very general one, and a wide latitude of construction has been given it. If a levee system tends in any appreciable degree to afford ease and safety to commerce, to intercourse which is essential to the carrying on of commerce, then an appropriation of money by Congress to construct such a system finds abundant justification in this grant of power.

The Mississippi River commission, in their report of February 17, 1880, say regarding levees:

There is no doubt that the levees exert a direct action in deepening the channel and enlarging the bed of the river during those periods of "rise" or "flood" when, by preventing the dispersion of the flood waters over the adjacent low lands, either over the river banks or through bayous and other openings, they actually cause the river to rise to a higher level within the river bed than it would attain if not thus restrained.

They give safety and ease to navigation and promote and facilitate commerce and trade by establishing banks or landing places above the reach of floods, upon which produce can be placed while awaiting shipment, and where steamboats and other craft can land in time of high water. * * * In a larger sense, as embracing not only beneficial effects upon the channel but a protection against destructive floods, a levee system is essential; and such a system also promotes and facilitates commerce, trade, and the postal service.

To the same effect are the subsequent reports of the commission and the statements of the individual members thereof before the committees of this House.

Prior to the act creating this commission a board of engineers was appointed on the improvement of the low-water navigation of the river below Cairo, Illinois. In their report to the Chief of Engineers, dated January 25, 1879, on the "effect of a permanent levee system on the Mississippi below the mouth of the Ohio River," they say:

To deal with the question whether there is any connection between levees and facilities for shipping, commerce, and navigation at high stages, we refer to the

actual condition of things. We find that throughout all the extension of the Mississippi along which the levee system is practically efficient, and where the marginal lands are generally cleared and cultivated, the levees have been an important aid to commerce. * * * Below the mouth of the Arkansas, as far down as the forts below New Orleans, the levees have been long enough in existence to give evidence of their effect, direct and indirect. Immediately behind them are the cultivated lands—the plantations—whence come sugar, cotton, and other valuable staples. To each one of these plantations not only is the levee the protecting agent which renders their cultivation practicable but it is during floods the landing place of the steamboats, barges, or flat-boats which bring their supplies and carry their productions away.

In the lower river, through the regions where the margins are under cultivation, the levees are generally laid close to these margins and afford, as has already been stated, useful facilities for commerce in making practicable the coming alongside of steamers and the receiving of the products of the plantations and discharging freights for the use of the same, or for the back country. In ordinary rises the natural banks are not overflowed, but when that happens in "flood" years, they (the levees) serve a purpose in still defining the channel.

From testimony like this, it cannot be doubted that levees aid not only in improving the navigation of the river but are themselves factors in the giving of ease and safety to commercial intercourse.

If the Federal Government can legitimately spend millions in affording facilities to commerce by improving the low-water navigation of rivers, by parity of reasoning it may just as legitimately spend millions in improving the high-water navigation of rivers like the Mississippi liable to overflow their banks. And the weight of evidence ten times over is that, for the Mississippi and its tributaries, a levee system is the most efficient method of improving their high-water navigation.

By the navigation of rivers is meant not alone the passage of steamers and other craft up and down but in a larger sense it includes likewise facilities for landing along the rivers, for the loading and unloading of cargoes, the taking on and putting off of passengers, &c. In other words, it embraces the affording of all needful facilities for intercourse, trade, traffic, and commerce, besides the width, depth, and extent of water requisite for the safe and easy passage of boats.

Again, navigation is only one of the elements of commerce. It is an element of commerce because it affords the means of transporting merchandise and the products of the country, the interchange of which is commerce itself. The river is but an instrument of commerce.

The power to regulate commerce is a power to regulate the instruments of commerce.—*Gray vs. Clinton Bridge*, 16 Am. Law Register, 152.

It extends to the persons who conduct it, as well as to the instruments used.—*Cooley vs. Board of Wardens*, 12 Howard, 316.

The commerce of the river and the commerce across the river, are both commerce among the States, and may be regulated by Congress, and should be regulated by that body when any regulation is necessary.—16 Am. Law Register, 154.

It is now conceded that Congress, under the commercial clause, may regulate railroads. May it not also regulate the Mississippi, a national highway and an instrument which commerce makes use of, so as to prevent it disturbing the commerce and intercourse going on by rail and by land in its valley?

The term "to regulate commerce" gives the power to restrain the destructive force of the thing used by commerce in its transactions. It is an incongruity to say that Congress, in the exercise of that power, may deepen or enlarge a river, but cannot curb its force or exercise restraint over it.

The power "to regulate commerce" necessarily includes protection to commerce. This idea has been acted on from the commencement of the Government. The construction and maintenance all along our coasts of light-houses, beacon-lights, fog-signals, sea-walls, and breakwaters attest this. All are for the protection and convenience of commerce.

The laws of the United States require steam-vessels to pay for the license or privilege to navigate; and the officers manning such vessels are required to pay for the license or privilege of pursuing their respective calling or vocation, such as master, pilot, mate, &c. These vessels engage in the coasting trade as well as in the carrying trade, and Congress is as much under obligations to afford the needful facilities for the transaction of this coasting trade as it is for the transportation of through freights. One of the facilities needed along the Mississippi for the coasting trade is convenient landing places at all times.

In seasons of flood, these landing places are supplied by the levees, and, in this sense, levees are but continuing piers or quays. A quay is defined to be a space of ground appropriated to the public use—such use as the convenience of commerce requires. Now, while the levees perform this service, while they furnish these needed conveniences to commerce, should it be objected that at the same time they protect the country behind them from overflow? Suppose they do protect private property while performing a public service, should they not be commended all the more for that? Should not that circumstance really be an additional inducement or argument for their construction? Should not broad and liberal statesmanship, in considering a question of this sort, rather approve of a system which, while subserving the public interests, at the same time affords needed protection to the life and property of the individual? "*Salus populi suprema lex.*" Sir, protection to private property, in some way, results from nearly every work of public import. If a street in a town or city be graded, paved, macadamized, the property belonging to individuals on that street experience an enhancement of value as the result of such improvement.

Every railroad constructed through a country increases the value

of the lands adjacent thereto. Every grand, imposing public building erected in this city, (Washington,) and every park laid out, beautified, adorned, adds something to the worth of neighboring private estates.

POLICE POWER OF THE GOVERNMENT.

This question of regulating the Mississippi certainly comes within the general police power of the Government, under which power "persons and property are subjected to all kinds of restraint and burdens in order to secure the general comfort, health, and prosperity of the State." (27 Vt., 149; quoted approvingly in 5 Otto, 471.) In the latter case the Supreme Court, speaking of the deposit in Congress of the power to regulate commerce, say:

What that power is, it is difficult to define with sharp precision. It is generally said to extend to making regulations promotive of domestic order, morals, health, and safety. As was said in *Thorp vs. The Rutland and Burlington Railroad Company*, (27 V. 149,) it extends to the protection of the lives, limbs, health, comfort, and quiet of all persons, and the protection of all property within the State. According to the maxim, *sic utere tuo ut alienum non ledas*, which, being of universal application, it must of course be within the range of legislative action to define the mode and manner in which every one may so use his own as not to injure others.

If the Government fails to exercise its police powers to control its property, and this property, like a great river, rises and inundates the country, and great damage to individuals results, the Government is or ought to be responsible.

Take the case of an Indian tribe placed by the Government upon a reservation and over which it exercises jurisdiction and surveillance. From some cause an outbreak occurs. The Indians throw off the restraint they are under, band themselves together, commence hostilities, and raid the surrounding country. For the damage and loss occasioned individuals by such an outbreak, the Government has repeatedly acknowledged its liability, and Congress has over and over again appropriated money to make good such losses.

Now, why should it not be equally responsible for losses occasioned by the Mississippi, when it in time of flood raids the adjacent country? The Government not only assumes paramount jurisdiction over the river but asserts a proprietary interest in and to it. Why, then, should it not be under obligations to restrain and control it, equal to the restraint and control it admits it should exercise over an Indian tribe placed by it upon a reservation?

If a railroad train kills the stock of a man, a suit lies to enforce payment of the value of the stock from the company. But the great Mississippi rises, and, by the neglect of the Government to protect its banks by dikes, overflows, causing the destruction of millions in value of property. No suit against the Government can be filed, for this great and free Republic does not permit what the veriest despots of foreign lands allow, namely, the general right to its citizens to sue the Government in any court of competent jurisdiction for injuries sustained by the act of commission or omission of the Government.

THE GENERAL WELFARE.

The first clause of section 8, article 1, of the Constitution prescribes that "Congress shall have power to lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the United States."

I agree with the interpretation that the above clause was not intended to invest Congress with the independent and general power "to provide for the general welfare;" and that the latter part of the clause, to wit, "to pay the debts and provide for the common defense and general welfare," is but a modification or qualification of the preceding part, namely, "Congress shall have power to lay and collect taxes," &c.

Nothing more was granted by that part ("to pay the debts and provide for the common defense and general welfare") than a power to appropriate the public money raised under the other part, ("to lay taxes," &c.) Said Thomas Jefferson:

To lay taxes to provide for the general welfare of the United States is to lay taxes for the purpose of providing for the general welfare. For the laying of taxes is the power and the general welfare the purpose for which the power is to be exercised. Congress are not to lay taxes *ad libitum* for any purpose they please; but only to pay debts, or provide for the welfare of the Union.

Under this interpretation, while a general power to legislate for the "general welfare" is excluded, Congress is still authorized to provide money for the common defense and general welfare, and this is quite broad enough for the practical purpose we have in view. Indeed, the power to lay taxes is in express terms given to provide for the common defense and general welfare. And, as laid down by Story—

It is not pretended that when the tax is laid the specific objects for which it is laid are to be specified, or that it is to be solely applied to those objects.

It suffices that all taxes must generally be laid for one or all of three purposes, namely, to pay the debts, to provide for the common defense, or the general welfare. And when the money has accumulated in the Treasury, from taxes laid for any or all of these purposes, as said by President Monroe, in his message of May 4, 1822:

The power of appropriation of the moneys (by Congress) is coextensive; that is, it may be appropriated to any purpose of the common defense and general welfare.

In other words, if operating under the latter clause, the taxes laid must be applied to some particular measure conducive to the general welfare. Or, as laid down by Story (volume 2, page 162:)

The only limitations upon the power (to appropriate money in aid of internal improvements) are those prescribed by the terms of the Constitution, that the ob-

jects shall be for the common defense, or the general welfare of the Union. The true test—

He continues—

is whether the object be of a local character and local use, or whether it be of general benefit to the States. If it be purely local Congress cannot constitutionally appropriate money for the object. But if the benefit be general, it matters not whether in point of locality it be in one State or several, whether it be of large or of small extent; its nature and character determine the right, and Congress may appropriate money in aid of it, for it is then, in a just sense, for the general welfare.

It was not only the right but the bounden and solemn duty of Congress to advance the safety, happiness, and prosperity of the people and to provide for the general welfare by any and every act of legislation within constitutional limits, which it may deem to be conducive to those ends. No one, Mr. Speaker, will have the temerity to question the proposition, that the protection of the extensive alluvial valley of the Mississippi from destructive floods will be, in the national sense of that term, conducive to the general welfare. Not one State but a dozen; not a few thousand people but millions are directly interested and affected for weal or woe according as this protection is extended or withheld. One overflow, as hereinbefore stated, has caused the destruction of fifty million dollars' worth of property, without taking into consideration the human and animal suffering and death inflicted by it. Does any sane man doubt that providing against the recurrence of such a public calamity is promoting the general welfare?

But it is unnecessary, Mr. Speaker, to dwell upon this. The point is conceded. No man of reflection will gainsay that if it were to the general welfare that we should acquire this territory as we did from France, it is equally conducive to the general welfare to preserve it as a habitable, cultivatable country; to protect it against relegation to its primeval condition of jungles and swamps. The words of Chief-Justice Bigelow, of Massachusetts, in the case of *Talbot vs. Hudson*, (24 Law Reports, 228,) are here singularly appropriate:

In a broad and comprehensive view, * * * everything which tends to enlarge the resources, increase the industrial energies and promote the productive power of any considerable number of the inhabitants of a section of the State, (Union,) or which leads to the growth of towns and the creation of new sources for the employment of private capital and labor, indirectly contributes to the general welfare and to the prosperity of the whole community.

Congress has exercised, not without question, it is true, but long enough for acquiescence to take place, the power to lay taxes to protect and encourage domestic manufactures. This has been and is being done on the ground that it is conducive to the general welfare to protect and encourage domestic manufactures. But it is not one whit more conducive to the general welfare, if as much so, than protecting the finest portion of our country for cultivatable purposes is.

Indeed, sir, there are millions of our people who believe that it is not to the general welfare to continue longer the tariff laws for the protection of domestic manufactures. But there are few, if any, who do not admit that it is directly in the line of the public welfare to protect from inundation the magnificent sugar, cotton, corn, and wheat lands of the great Mississippi basin.

All must admit, Mr. Speaker, that the powers of the Government are limited and that its limits are not to be transcended. But, as was observed by the Supreme Court of the United States, in 4 Wheaton, 421, the sound construction of the Constitution must allow the national Legislature that discretion, with respect to the means by which the powers it confers are to be carried into execution, which will enable that body to perform the high duties assigned to it in the manner most beneficial to the people.

Let the end be legitimate, let it be within the scope of the Constitution, and all means which are appropriate, which are plainly adapted to that end, which are not prohibited, but consist with the letter and spirit of the Constitution, are constitutional.—*Id.*

In *McCulloch vs. Maryland* (4 Wheaton, 415) Chief-Justice Marshall aptly referred to the Constitution as "intended to endure for ages to come, and consequently to be adapted to the various crises of human affairs." And in *Hunter vs. Martin* (1 Wheaton, 304) it was said:

The instrument [Constitution] was not intended to provide merely for the exigencies of a few years, but was to endure through a long lapse of ages, the events of which were locked up in the inscrutable purposes of Providence. It could not be foreseen what new changes and modifications of power might be indispensable to effectuate the general objects of the charter. * * * Hence its powers are expressed in general terms, leaving the Legislature, from time to time, to adopt its own means to effectuate legitimate objects, and to mold and model the exercise of its powers as its own wisdom and the public interests should require.

Mr. Speaker, when the great Father of Waters, unhindered by an adequate levee system, rises out of its banks and sweeps with resistless might over the valley, a more than crisis, a sad realization of the worst, is upon the people of that unhappy section; and this grievous affliction of one of the members of the body-politic, in more or less degree, disastrously affects the whole. Sir, against the recurrence of the like calamity, national in its effect, we ask the aid of the National Government. We ask it because we believe and hold that the powers delegated in general terms in the Constitution are broad and comprehensive enough to justify it; that the granting of national aid for such purpose is directly in the line of the effectuation of the legitimate objects of the charter.

"Constitutions of government," says Story, (volume 1, page 655,) "are not to be framed upon a calculation of existing exigencies, but upon a combination of these with the probable exigencies of ages, according to the natural and tried course of human affairs. There

ought to be a capacity to provide for future contingencies as they may happen." That this capacity exists in the Federal Constitution no one will deny. The trials it has undergone, the tests it has been put to and triumphantly emerged from, in the hundred years of its existence, abundantly attest it. Let this Congress, Mr. Speaker, give another evidence of this capacity by providing against the contingency of another great overflow; let this provision be ample and unrestricted; let it meet the case.

WHAT OTHER COUNTRIES HAVE DONE.

It will be instructive, Mr. Speaker, to glance at what has been done by other countries in the way of undertaking and prosecuting great works of public improvement. From it we may derive encouragement to expend a small part, at least, of our surplus revenues in protecting the property and lives of our brothers dwelling in the valley of the great river from its periodical floods.

The greater part of the Netherlands has been formed of deposits of rivers in the same manner as the Egyptian delta is formed by the Nile, or the delta of the Mississippi by that great river. The principal rivers which have so formed it are the Rhine, including its different branches, the Meuse and its branches and confluents, and the Scheldt.

To establish a firm footing amid so many rivers the inhabitants have kept them as far as possible within prescribed channels by embankments and have formed innumerable canals to receive the superfluous waters and to serve as means of internal communication. "The system of drainage," says a writer in the *Encyclopædia Britannica*, "of what would otherwise have been an immense mud bank, well deserves to be ranked among the wonders of the world. The land thus rescued from the rivers is nowhere much elevated above the sea, and in many places is even below the sea-level, so as to require still more wonderful defenses against the ocean. These defenses are in part supplied by the operation of nature, casting up sand hills along great part of the coast; but where these have not been formed their place is supplied by dikes of vast extent, built in the course of ages, partly of huge blocks of granite brought from Norway and partly of bundles formed of young trees reared expressly for the purpose. These dikes stretch for hundreds of miles along the coast, and with those which line the rivers and canals, and with the requisite sluices, drawbridge, and hydraulic works of every kind are estimated to have cost not less than £300,000,000." (Equivalent to about \$1,500,000,000.) "They form in so small a country a most astonishing monument of human industry. Yet they are not greater than the situation requires. They are barely sufficient to preserve the country from the dominion of the waters. The motto on the arms of one of the provinces, '*Luctor et Emergo*,' still describes the struggles of the invincible Hollanders requisite for maintaining the ground they stand upon." The highways or roads often run for miles in a straight line along the summits of these dikes, and are thus at once dry and elevated, commanding extensive views.

Not only have the Hollanders done this but they have also drained and reclaimed Lake Haarlem, containing 42,000 acres. As early as A. D. 1643, a proposition to endyke and drain the lake was made; and similar schemes, notably in 1742 and 1821, were brought forward from time to time. But it was not until 1836, when one furious hurricane, on the 9th of November, drove the waters as far as the gates of Amsterdam, and another on the 25th of December sent them in the opposite direction to submerge the streets of Leyden, that the mind of the nation was turned seriously to the matter. In August, 1837, the King appointed a royal commission of inquiry; the scheme proposed by the commission received the sanction of the second chamber in March 1839, and in the following May the necessary law was passed and the work commenced. The lake covered an area of about seventy square miles, and had an average depth of more than thirteen feet. As it had no natural outfall it was calculated that probably one thousand million tons of water would have to be raised by mechanical means.

Pumping commenced in 1845, and the lake was dry by the 1st of July, 1852. The cost of reclaiming this 42,000 acres was £1,080,000, or about \$5,400,000. The government, however, sold lands to the amount of £780,000, so that the actual cost to the nation was only £300,000, or \$1,500,000.*

But it will be observed the reclamation of this land was not the sole purpose of the work. Indeed, the main incentive was the protection of the adjacent country from occasional or periodical submergence by the lake. It was judged that the best way to do this was to drain the lake, and accordingly it was done. Thus two beneficial purposes were effected: the protection of the surrounding country and the opening up to cultivation 42,000 acres of land.

Sir, a greater argument presents itself why this Government should undertake the construction of an adequate levee system on the Mississippi, for the beneficial ends to be attained thereby are threefold, namely, the improvement of the navigation of the river; the protection of the cultivated lands in its valley and the lives and property of the dwellers therein from destructive floods; and the opening up to cultivation millions of acres of the finest lands in the world.

Now, sir, let us see what the condition of Holland was about the time of the completion of the aforesaid gigantic works of internal improvement. According to the census of that country of 1853, the

eleven provinces constituting Holland contained a population of only 3,203,232; and according to the budget of receipts and expenditures of the national revenue for 1856, the total revenue from all sources of the government was £6,099,255, or about \$30,500,000.

Mr. Speaker, when we consider the small number of inhabitants of that country, and the small revenue of the government at the time of the completion of these works, we do not wonder that what they have performed in the way of protection against the mad waters should excite the marvel and admiration of mankind. In the language of another:

The inhabitants of this little storm-beaten republic, with matchless courage and constancy, have literally raised their country from the bed of the ocean, through centuries of toil, and advanced it to the foremost position in Europe in commerce, agriculture, manufactures, opulence, and arts. All this has been done amid the storms of a frozen ocean by a handful of people, through the instrumentality of their government.*

To this what says this great Republic with its 50,000,000 of people and its annual revenues of \$400,000,000? Does it begrudge the five or six millions which the bill under consideration proposes for the Mississippi? I do not believe it. Mr. Speaker, the amount ought to be trebled, and a like amount annually appropriated until the great valley is secured beyond peradventure against the floods of which it is now the prey.

Besides the Rhine, the Meuse, and the Scheldt, the rivers Po and Vistula, in Europe, are also diked. The average height of the dikes on the latter river are twenty feet.

The Nile is also leveed, front and cross levees. The latter, from three to five feet high, cut the land into a succession of basins, which are flooded at will in seasons of high water by sluices opening from a system of main canals. (Warren's report in 1875.)

The British and Canadian Governments have about completed works which cost over \$30,000,000, in addition to earlier improvements on which \$24,000,000 were expended, making a total of over \$54,000,000 spent in order to control as far as possible the carrying trade of our grain-raising States.†

Besides this, the English Government has greatly encouraged the cultivation of cotton all over its colonies, and in other countries has greatly stimulated interest in the matter. France, Greece, Turkey, Morocco, Egypt, Portugal, Japan, and even Russia have been appealed to, and all have aided by exemption from taxation, by land grants and bounties, the growth of cotton in their dominions.‡

Cotton production in India rose from 445,000 bales in 1860 to 1,500,000 bales in 1866.‡

In 1861, continues this report—

Lord Dalhousie inaugurated the railway system for India, projecting 4,000 miles of railroad, to be constructed at the expense of \$440,000,000. The government engaged to pay the interest on all sums invested in these India roads, in the belief that, with these works of internal improvement, all obstacles to a full supply of cheap cotton would be removed. It is not out of place to remark in this connection that if England can afford to take such risks to wrest from America its monopoly of the cotton-plant, surely our Government should make some expenditure to preserve it.*

In 1878, for one river alone—the Rhone—the French Government appropriated \$15,000,000, to be expended in works of improvement between Lyons and the sea. The total length of the Rhone from where it enters France on the Swiss frontier is only three hundred and twenty-four miles, and yet this large expenditure was authorized; while we, for the thousands of miles of water-way presented by the Mississippi, hesitate at an expenditure of a few millions. Claudius, one of the Roman emperors, is said to have employed 30,000 men for twelve years upon a single canal. But this was before the Christian era, and our orthodox members might object to going back to pagan Rome for an example.

WHAT THE FEDERAL GOVERNMENT HAS DONE.

Now let us see what has been done in the past by our own Government in the way of appropriations and expenditures for the acquisition of territory and the development of the country. Let us look at this for the reason that if precedent were needed for the appropriation which the bill under consideration makes for the improvement of the Mississippi and the protection of its alluvial valley from destructive floods, it can be found in the array of figures which follow.

There is not one word in the Federal Constitution relating to the acquisition of territory nor directly authorizing the appropriation and expenditure of money therefor; yet who doubts the constitutionality of the proceedings by which the original area of the United States has been quadrupled? It was not necessary for the Constitution to directly authorize the acquisition of territory any more than it was for it to directly authorize the expenditure of public money to protect great sections of our common country from destructive floods. The authority for both exists just as effectually as incidents to one or more of the general powers granted. The acquisition of territory finds its justification in the war-making and treaty-making power which the Constitution vests in Congress. The authority to add to the public domain is incidental to the power to declare war and to enter into treaties.

This fully justifies the expenditure of \$88,157,380.98 made by this

* Wm. M. Burrell, New Orleans.

† The Mississippi and its Tributaries, by A. D. Anderson.

‡ A. D. Banks's report on statistics of cotton, &c., of the Mississippi basin.

* Encyclopædia.

Government up to this time in the acquisition of territory. These acquisitions are as follows:

The Louisiana purchase, 1803 (this includes the principal and interest and claims of citizens of the United States due from France paid by the United States as part of bargain).....	\$27,267,621 98
The Florida purchase of 1819.....	6,489,768 00
The Mexican acquisition, by treaty of Guadalupe Hidalgo, 1848.....	15,000,000 00
The purchase from the State of Texas, by acts of September 9, 1850, and February 28, 1855, (principal and interest).....	16,000,000 00
The purchase from Mexico, (Gadsden,) 1853.....	10,000,000 00
The purchase from Russia, (Alaska,) 1867.....	7,200,000 00
The purchase from Georgia, her cession, 1802, and Yazoo scrip claims.....	6,200,000 00
Total.....	*88,157,389 98

Congress acted wisely and well in acquiring this immense territory. It, too, has been liberal—we will not say wise—in disposing of it, as will be seen from the following:

LAND GRANTS.

The estimated area of the grants of land made by Congress to States and Territories and to corporations, mainly railroad corporations, from the year 1850 to June 30, 1880, is as follows:

Acres.	Acres.
In Illinois.....	2,595,053
In Mississippi.....	1,137,139
In Alabama.....	2,807,648
In Florida.....	1,760,467
In Louisiana.....	1,256,439
In Arkansas.....	2,613,631
In Missouri.....	2,605,251
In Iowa.....	4,181,929
In Michigan.....	3,355,943
In Wisconsin.....	3,553,865
In Minnesota.....	9,836,450
In Kansas.....	8,223,380
In Nebraska.....	6,409,376
In Colorado.....	3,000,000
In Nevada.....	4,000,000
In California.....	16,387,000
In Oregon.....	5,800,000
In Dakota.....	8,000,000
In Wyoming.....	4,500,000
In Montana.....	17,000,000
In Idaho.....	1,500,000
In Washington.....	11,700,000
In Utah.....	1,850,000
In New Mexico.....	11,500,000
In Arizona.....	18,500,000
Total.....	†154,067,553

This enormous quantity of land at the Government price of \$1.25 per acre would yield the princely sum of \$192,584,411. Besides these land grants, the United States Government has expended in money, on account of railroads, canals, and wagon-roads, from 1789 to 1873 (have not the figures since 1873) the following sums, namely: ‡

Maine.....	\$137,008 92
New Hampshire.....
Vermont.....
Massachusetts.....
Rhode Island.....
Connecticut.....
New York.....	3,500 00
New Jersey.....
Pennsylvania.....

Iowa and Nebraska.....	2,182,703 38
Miscellaneous.....	5,299,069 25
Total.....	104,705,163 43

This enormous expenditure was made, presumably, mainly under the "commercial clause" of the Constitution, on the plea, doubtless, of affording greater facilities to commerce and intercourse; and also

* Executive Document 47, part 4, page 18, House of Representatives, Forty-sixth Congress, third session.

† Executive Document 47, part 4, page 267, House of Representatives, Forty-sixth Congress, third session.

‡ Senate Executive Document No. 12, Forty-third Congress, first session.

under the "general-welfare clause" as contributing to the common defense and general welfare. All I have to say is that it is a pretty big incident to those powers. An appropriation of a few millions to protect the alluvial basin of the Mississippi from inundation would not be as much a strain on the Constitution as were these appropriations. If the authority to make the same were legitimately derivable as incidental to the "commercial clause" and the "common-defense and general-welfare clause," surely an appropriation for the Mississippi, to build levees as well as deepen the channel, is likewise legitimately incidental to those powers.

Besides the aforesaid expenditures on account of railroads, canals, and wagon-roads, the Federal Government expended in public works in the respective States and Territories, from 1865 to 1873—a period of nine years—the following incredible amounts, namely:

Maine.....	\$3,030,500 71
New Hampshire.....	1,285,212 34
Vermont.....	209,256 35
Massachusetts.....	6,071,197 65

If to this be added the sums spent on public works since 1873, the above total would be increased many more millions.

Mr. Speaker, comment on this array of figures is unnecessary. Additional precedents will hardly be asked even by the most exacting. The only authority in the Constitution to be found for the expenditure of the greater part of these vast sums is derivable by implication only from the general delegation of powers contained in that instrument. Yet that is sufficient; has been held so repeatedly by the Supreme Court of the United States; and has been acquiesced in by the American people. It is too late now to question its legitimacy or sufficiency.

Shall we suddenly call a halt in this policy, and that, too, on the great Mississippi, and on that section of our common country which has received by far the least of the benefits and munificence of the Government? God forbid! The President of the United States has lately called attention to the fact that a war tax of nearly \$70,000,000, of very doubtful propriety, to say the least for it, was collected on cotton from 1863 to 1868—a measure which failed to receive the sanction of the Supreme Court of the United States when brought before that high tribunal.

The greater part, perhaps, of this tax was wrung from the people immediately contiguous to the Mississippi and its lower tributaries. As suggested by the President, it would be but a measure of common justice to return at least a portion of this tax in the way of appropriations to protect the people of that section from the periodical floods of the great river.

On the point of the general acquiescence of the country as to the power of Congress to make appropriations in aid of works of internal improvement, it would not be amiss to cite the words of President Jackson in one of his messages to Congress. Said he:

For, although it is the duty of all to look to that sacred instrument instead of the statute-book; to repudiate at all times encroachments upon its spirit, which

* Senate Executive Document No. 12, Forty-third Congress, first session.

are too apt to be affected by the conjecture of peculiar and facilitating circumstances; it is not less true that the public good and the nature of our political institutions require that individual differences should yield to a well-settled acquiescence of the people and confederated authorities in particular constructions of the Constitution on doubtful points. Not to concede this much to the spirit of our institutions would impair their stability and defeat the objects of the Constitution itself.—*Elliott's Debates*, vol. 4, page 532.

WHAT PLAN SHOULD BE ADOPTED.

To protect the alluvial basin of the Mississippi from destructive floods, as well as contributing directly or indirectly to the improvement of the navigation of the river, a complete levee system is requisite. This is the judgment of the Mississippi River commission; it is the judgment of the great majority of the people living in the valley, and, therefore, directly interested; and it is the judgment of the Senators and Representatives in Congress from the section of country liable to these floods. Says the report of G. K. Warren, and others, in 1875:

The existing system of levees on the Mississippi was begun a century and a half ago near New Orleans, and has gradually extended upward. The crops of cotton, sugar, corn, and rice, heretofore gathered from the alluvial region, with all the existing wealth represented by lands under cultivation, cities, villages, plantations, and stock, are the direct fruits of this method of protecting the country against overflow.

The report continues:

It is claimed by some that the effect of embanking a river and thus confining its sedimentary matter to the channel is to cause the deposit formerly made on the banks to settle on the bottom, and thus ultimately raise the bed, and with it the high-water mark. This idea is usually defended by appealing to the example of the Po, which is asserted to have thus raised its bed several feet. This error regarding the Po was first promulgated by De Prony in the early part of this century. But the great Italian hydraulic engineer, Lombardini, has since refuted it in the most conclusive manner, by proving that there is no ground whatever to believe that levees have produced the slightest elevation of the bed of the Po. It is said that observations upon the Rhine, extending over a period of eighty years, demonstrate the same truth for that river.

These are the words of scientific men, eminent in their profession, uninterested, except as citizens of the Republic, in the development of the valley of the Mississippi, in the service of the Government, and made prior to the creation of the Mississippi River commission. The last-named body, composed of equally eminent, honorable, and scientific men, follow in the same line.

THE FLOOD OF 1882.

The great urgency for immediate action by Congress is taught by the lesson of the flood of the present year. Says an exchange:

It is only by consulting statistics that an idea can be had of the magnitude of the losses sustained by the destructive and prolonged flood in this part of the Mississippi Valley. The value of the products raised in the submerged country in 1881 were about \$63,000,000—\$33,000,000 worth of cotton, \$22,000,000 of sugar, \$5,000,000 of molasses, and about \$3,000,000 worth of rice. More than one hundred thousand people have been rendered destitute. Houses and farms have been swept away; thousands of cattle have been drowned, and there have been hundreds of human victims to the angry waters. Were it not for the levees this wide-spread calamity would be repeated every year until the alluvial bottoms would be depopulated.

Says the New Orleans Times-Democrat:

One hundred thousand square miles of territory, comprising 64,000,000 acres of as fertile and productive farm land as can be found on the planet, is devastated and desolated by the surging waters of the Mississippi and its tributaries. Thousands of plantations, farms, and gardens have been entirely or partially destroyed, while innumerable horses, cattle, and other farm stock have been hurried to destruction by the raging flood.

And a correspondent of the latter paper, writing from Yazoo City, under date of March 25, 1882, draws the following sad picture of the overflow:

The outlook at this writing, as regards the high water, is indeed chilling and gloomy, although a decline of the flood seems to have commenced. But when one estimates, even crudely, the probable loss that this dire affliction will entail upon an already sorely aggrieved and heavily burdened people, it presents a picture which, correctly delineated, is sufficient to excite every sentiment of human sympathy and every emotion of genuine sorrow and commiseration. It is a picture where physical suffering goes hand-in-hand with death, where homes are broken up, lives lost, property wrecked, destroyed, and washed away, and over all and above all rises the grim figure of a present woe, a pinching poverty, a lamentable helplessness that forbode ill of all power for recuperation and rehabilitation when these wild wastes of water shall return to their proper meads and bounds. It is an epoch in a century, a memorable scene for a life-time, a grandly gloomy panorama of suffering, danger, deprivation, and agony, in this incursion of the waters upon the lands and houses and cities of ours and adjacent people.

Mr. Speaker, it is useless to dwell upon this. The details of the recent great calamity which visited that unhappy section of the country are too fresh in the minds of the country and of this House to need repetition here. And, sir, the flood of 1882 is but one of the many which have visited that country, as the appendix to this will show. Sir, invoking the judgment of the American people on this subject of protection to this magnificent portion of our country, through their Representatives on this floor, I thank the House for the courtesy it has extended me.

APPENDIX.

[From the New Orleans States.]

Former floods—Great crevasses of the past—What the Mississippi Valley has experienced within a hundred years.

From the report upon the physics and hydraulics of the Mississippi River prepared by Captain A. A. Humphreys and Lieutenant H. S. Abbot, Corps of Topographical Engineers, United States Army, some interesting statistics relating to the great floods since 1798 are gathered.

The report says: Great care has been taken to collect information from all reliable sources. For the more recent floods this has been comparatively easy, but

for those of former times it has been found impossible to determine even the most essential particulars. The list of floods, however, is complete for the present century; for in 1798 a regular record was begun at Natchez by Governor Winthrop Sargent, and continued by him till 1819.

From that date until 1814 observations at the same place were made by Mr. Samuel Davis. They were continued by Professor Forshey until 1848, when he removed to Carrollton and began a new series there. The latter, together with the records kept at

THE MEMPHIS NAVY-YARD.

render the information complete up to the date of the commencement of the present survey in 1851.

Prior to 1798 we have only occasional notes preserved among the papers of the colonies. Governor Sargent, however, states that according to tradition there was no very high water between 1750 and 1770, and that from 1770 to 1798 there was no general overflow. The latter statement is contradicted by the records respecting the flood of 1782.

FLOOD OF 1718.

An extraordinary rise of the Mississippi this year. Bienville had selected a site for a city, but the colony not having means to build dikes or levees the idea was for the present abandoned.

FLOOD OF 1735.

Gayarre states that in this year the waters were so high that many levees were broken, and much damage was done. New Orleans itself was inundated. The flood continued from the latter part of December to the latter part of June. When the river fell it reached a lower point than ever before noted, the range at New Orleans being fifteen feet.

FLOOD OF 1770.

A great flood, according to the tradition recorded by Governor Sargent. It is uncertain whether this flood was equal to that of 1811.

FLOOD OF 1782.

This year the Mississippi rose to a greater height than was remembered by the oldest inhabitant. In the Attakapas and Opelousas the inundation was extreme. The few spots which the water did not reach were covered with deer.

FLOOD OF 1785.

A great flood at Saint Louis in April, said to have been equal to that of 1844. Professor J. L. Riddle, of New Orleans, states on the authority of the l'Amides Lois and Evening Journal, May 25, 1816, that New Orleans was flooded by crevasses.

FLOOD OF 1791.

Same remarks at New Orleans as for flood of 1785.

FLOOD OF 1796.

The Teche overflowed its banks for some sixty miles above New Iberia and poured into Grand Lake in a smooth sheet of water. The lake at this date attained the highest level record, being 2.5 feet higher than in 1828, 6.8 feet higher than 1850, and 1.4 feet higher than the ordinary Gulf level.

FLOOD OF 1799.

Same remarks at New Orleans as for the flood of 1785.

FLOOD OF 1809.

A disastrous flood which, according to Governor Sargent's notes, inundated all the plantations near Natchez and destroyed the crops. It was imagined by the sufferers that the Northern lakes had found a channel to the river.

FLOOD OF 1811.

There was a great flood this year. Much damage was done.

FLOOD OF 1813.

was 6 to 8 inches higher than 1811. In 1813 when the Pointe Coupée levee was broken the water (in the lower part of Atchafalaya basin—Grand Lake) rose 4 to 5 feet above any elevation it had attained since 1780.

FLOOD IN 1815.

A very great flood. At the mouth of the Ohio it attained the highest point ever recorded, i. e., 2 feet above the high water of 1858.

It was due to the general coincidence of freshet in the Ohio, the Upper Mississippi, the Missouri, the Cumberland, and the Tennessee. Red River must have been low enough to allow Bayou Atchafalaya to do good service as an outlet, for at Morganza the flood was 0.6 of a foot lower than that of 1828, and no damage below Red River Landing is recorded.

FLOOD OF 1816.

Same remarks at New Orleans as for flood of 1785.

FLOOD OF 1823.

This was a great flood, which was highest at Napoleon on June 1, and at Natchez on May 23. It was caused by a flood within Arkansas, which occurred when the Mississippi was high. A great number of crevasses occurred below Red River on both banks of the river.

FLOOD OF 1824.

This flood was 0.7 of a foot below the high water of 1815, or 1.2 feet below that of 1859 at Natchez.

Between 1824 and 1860 the only great flood years were 1828, 1844, 1849, 1850, 1851, 1858, 1859. It is true that the river was quite high at certain localities in some of the intermediate years, as in 1832, 1836, and 1847, but the floods were of no secondary character, in general point of view, that they do not require discussion.

FLOOD OF 1828.

This flood occurred before the country above Red River Landing was much settled, and it is probable that its marks have been confounded with those of 1815 in many localities. The Saint Francis and Yazoo bottoms were deeply inundated, being entirely unprotected by levees.

Relative to this flood in the Tensas bottom, it was the highest of which we have even traditions. The whole region was under water. In the western part of the Atchafalaya basin the flood was the greatest of which we have record, there being no levees for several miles below the mouth of Red River. The overflow extended to the extreme western limit of the alluvial formation, instead of only six to eight miles from Bayou Atchafalaya, as in ordinary floods. The plantations along the upper part of the Teche were not flooded, but the crops were lost on those within the influence of the backwater from the Atchafalaya overflow.

The eastern part of the Atchafalaya basin, indeed the whole region bordering upon the Mississippi below the head of this basin, seems to have nearly escaped damage, the only exception being the Grossetete region, which was deeply flooded by backwater from the Atchafalaya overflow, and by a break in the Grand levee of the parish of Pointe Coupée, near Morganza.

FLOOD OF 1844.

A considerable rise occurred in April from a freshet in Arkansas River. In May, however, before the lower river had subsided, another and much greater flood in the Arkansas occurred. Above the mouth of the Red River the country was more or less flooded, but, Red River being fortunately low, the Atchafalaya carried off enough water to protect the plantations below the mouth of that stream

from serious damage. This was the condition of the river in June when the great combined flood of the Upper Mississippi and the Missouri, which has rendered this year memorable in river annals, occurred.

The country above the mouth of the Red River was generally flooded. The Saint Francis and Yazoo bottoms were nearly unprotected by levees, and the water had free entrance. The Tensas bottom was badly inundated through breaks in the levees. Below the Red River Landing the country escaped with but little injury, owing to the very low stage of the Red River, which allowed the Atchafalaya to carry off the greater part of the surplus discharge of the Mississippi.

FLOOD OF 1849.

The gauge at Carrollton indicates that the river rose nearly to high-water mark in the latter part of January, and remained there with occasional oscillations until the middle of May.

Above Red River Landing the ravages occasioned by this flood were comparatively slight.

The Saint Francis and Yazoo bottoms were inundated, but to an extent not unusual for great flood years. Below Red River Landing the injury done was so immense that the flood is justly classed among the most destructive ever known. On April 7 a crevasse broke on the west bank, about fifteen miles above New Orleans, at Fortier's plantation.

This flooded the country between the Mississippi and Bayou La Fourche to a depth of about four feet, and this submerged the rear of many rich sugar plantations. The effect of this crevasse upon the bed of the river has been much discussed. On the left bank a crevasse occurred on May 3, at Sauve's plantation, seventeen miles above New Orleans, by which the city was inundated. The break remained open forty-eight days and did an immense amount of damage.

FLOOD OF 1850.

It appears that there were four principal rises, of which the first and second produced very little, if any, damage. The third was the highest in the latter part of March, and the fourth in the middle of May. The damage occasioned by this flood was immense. The Saint Francis and Yazoo bottoms were not protected by levees, and both were deeply flooded. The Tensas bottom was submerged more effectually than in any year subsequent to 1828. The principal breaks were above the Louisiana line, which flooded Bayou Macon.

The water rose steadily until March 15, then declined slowly until early in April, then rose again until the middle of May, when it attained its highest point, and then rapidly subsided. At the mouth of Black River the flood was three feet above that of 1814 and five feet below that of 1828. It is needless to add that nearly the whole region was submerged and the crops destroyed. Below Red River Landing the country fared but little better.

The water pouring from Red River exceeded the discharging capacity of Bayou Atchafalaya, and the surplus forced its way into the Mississippi by both of the mouths of Old River. The flood from above, augmented by this new supply, maintained an elevation sufficient to keep the numerous crevasses below Red River Landing actively discharging for more than four months. The basin between La Fourche and the Mississippi escaped nearly uninjured.

The crops upon the left bank above New Orleans were much injured by the celebrated Bonnet Carré crevasse, which attained a width of nearly seven thousand feet, and continued flowing for more than six months.

FLOOD OF 1851.

There were three principal rises at the head of the alluvial region. The first occurred in December, 1850, but exercised very little, if any, influence upon the succeeding overflow. The second rise, so far as can be ascertained, was caused mainly by the Ohio. At Memphis it was highest on March 11. From February 10 to February 21, inclusive, there was a total rise of twenty-eight feet.

The third rise of 1851 was caused by a combination of great floods on the Upper Mississippi and Missouri. The rise began in the latter part of May and continued till June 20. The Yazoo bottom was partially flooded by the second rise, and the Saint Francis by both the second and third rises of this flood. The Tensas bottom escaped with little injury, the natural drains being sufficient to carry off the crevasse water.

Below Red River Landing there were several crevasses. The damage occasioned by them was local. The Atchafalaya basin escaped unharmed. It may be said that this was a very unusual flood in the Mississippi, above the mouth of the Ohio and below the mouth of Red River, but that between those points it cannot be so classed.

FLOOD OF 1858.

In the flood of 1858 there were four great rises. The first, caused mainly by a flood in the Ohio, occurred in December, 1857. The second rise occurred in the latter part of March and the first part of April, 1858, and was caused by a general swelling of the lower tributaries of the Missouri, Upper Mississippi, and Ohio. The third great rise occurred in the latter part of April. The Tennessee was unusually high.

The last and greatest rise in the flood of 1858 occurred at the head of the alluvial regions in June. It inundated the city of Cairo. It washed away miles of levees along the Saint Francis front, and poured rapidly into the bottom lands of that river. In the White River swamps the same condition existed. The Yazoo and Tensas bottoms, on the contrary, were comparatively empty. The June rise terminated the flood.

FLOOD OF 1859.

This flood was characterized by two principal rises at the head of the alluvial region. The first occurred in December, 1858, and was due entirely to a general swelling of the Ohio tributaries. The second rise occurred earlier and remained longer than usual. The rise at Louisville began on February 15, and continued to oscillate till the latter part of June and the first part of July. Only a small quantity of water escaped from the river into the Saint Francis bottom above Columbus.

Between Helena and Napoleon the crevasses were less dangerous than in 1858. Between Napoleon and Lake Providence and Vicksburg the crevasses were about the same as in 1858. Red River was low; during this entire flood it is probable that Bayou Atchafalaya, besides conveying off the river and crevasse drainage from the Tensas bottom lands, relieved the Mississippi by the channel of Old River of some part of its surplus discharge.

The Saint Francis bottoms were overflowed, but to a much less extent than in 1858. Above the mouth of the White the Yazoo Bottoms escaped with comparatively trifling damage, but below that point it was deeply flooded. The White River bottom lands were submerged. The Tensas bottom lands above Columbia escaped uninjured, but below that town they were badly overflowed.

Below Red River Landing no serious damage was done except on the left bank, in the vicinity of Bonnet Carré, where the country was flooded by a crevasse which occurred at the lower end of the site of the celebrated break in 1850.

From the report of the board of commissioners, appointed under act of Congress, June 22, 1874, made in 1875, upon the reclamation of the alluvial basin of the Mississippi River subject to inundation, the following extracts are made:

FLOOD OF 1862.

Beyond doubt this was one of the greatest floods which ever occurred upon the Mississippi, but the war raging at the time has so obliterated all records that it must always remain classed with the traditional overflows of 1815 and 1825.

We know that there was a great flood in the Ohio River at Cincinnati, and also in the Cumberland, some time in the spring of 1862, and a destructive overflow in the Wabash in February.

At Cairo the highest water occurred May 2, and was 1.2 feet above the high water of 1858. It is believed that there was no flood in the Yazoo or Red Rivers at date of high water in 1862, (except water returning from the swamps,) but the records are too defective to render this certain.

FLOOD OF 1865.

Occurring just at the close of the war, no facts have been preserved upon which to base a close analysis of this flood. Rising to a less level than that of 1858 at Cairo by sixteen feet, there is no probability that the flood of 1865 equaled that, or even the flood of 1867 in maximum discharge into the alluvial regions. The daily oscillations at Cairo and New Orleans give a good general idea of the flood, which seems to be remarkable for duration rather than for extreme volume of maximum discharge.

It probably received relatively small contributions from the Wabash, the Cumberland, and Tennessee. It is uncertain that no flood occurred in the Arkansas or White Rivers. The fact is recorded that at the mouth of Bayou Tensas the flood rose 1.8 feet above all previous marks, a circumstance no doubt explained by the immense crevasses in Carroll and Madison Parishes. It is also a matter of record that the Bayou Teche overflowed its banks in low places as far up as Franklin. In fine, then, we may confidently place the overflow of 1865 in maximum discharge far short of the quantity in 1858 or even in 1867.

FLOOD OF 1867.

In some respects its origin was peculiar. The heavy downfall of snow and rain in the Ohio Valley, a sudden thaw caused moderate floods in the Alleghany and Monongahela Rivers and a great flood in the Wabash, the combined effects of which caused a sand rise in the Ohio.

At Helena the first rise culminated March 14, standing one foot above high water of 1858 and 0.8 of a foot below that of 1862.

The river then subsided about 0.3 of a foot, but again swelled to the highest point on April 1, being 0.2 of a foot above first rise. There was a moderate freshet in both the Arkansas and White Rivers; the Yazoo discharged a considerable volume; in the Red River there was a considerable flood in June, due chiefly from the Ouachita.

The Atchafalaya basin was deeply flooded through a break in the Grand levee near Morganza. The Teche country was under water. The actual water-mark of 1867 was, in general, a little higher than that of 1858.

FLOOD OF 1874.

In February the rain-fall throughout the alluvial regions was not unusual, and the river was generally about at mid-stage.

In March heavy rains prevailed throughout the lowland below Cairo, thus filling the swamps and swamp rivers, and rapidly raising the Mississippi. In April these rains became excessive and extended eastward over the valley of the Tennessee and Cumberland Rivers. In Missouri the breaks were very numerous. Between Commerce, Missouri, and the Louisiana line there were 136.5 miles of crevasses and breaks.

The flood of 1874 rose 1.2 feet higher at Helena than in 1858. There was no great flood, properly speaking, in the Arkansas River in 1874. In the White River there was a destructive overflow. In the Yazoo there was the largest freshet on record, due to rain-water alone. The combined rain and crevasse water in the Yazoo raised the Mississippi at Vicksburg 3 feet during the last three weeks of April. At Alexandria the Red River rose 23 feet between February 1 and April 4.

In the Wabash the greatest flood on record occurred. Bolivar County, Mississippi, suffered severely from a rise in the Arkansas and White Rivers in March. The bottom lands of the Tensas were flooded through the crevasses in Carroll Parish. The overflow of the Atchafalaya basin was extreme in this flood. Bayou Teche was deeply inundated from Saint Martinsville down. The Bonnet Carré crevasse raised Lake Pontchartrain suddenly about two feet.

Rivers and Harbors.

SPEECH

OF

HON. MARTIN L. CLARDY,

OF MISSOURI.

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, June 7, 1882.

On the bill (H. R. No. 6134) making appropriations for the construction, repair, and preservation of certain works on rivers and harbors, and for other purposes.

Mr. CLARDY said:

Mr. SPEAKER: I regret that the House has not been allowed to consider the bill reported by the Committee on Levees and Improvement of the Mississippi River providing for a separate appropriation for the improvement of that river. That bill, under the rules of the House, was referred to the Committee on Commerce, and this committee has not seen proper to report it, but has embodied in the general river and harbor bill certain appropriations for the improvement of the Mississippi.

The committee seems not to have understood the necessity or propriety of segregating the Mississippi River from the other rivers of the country in making provision for its improvement. I beg leave to remind the members of the Committee on Commerce and the House that there is no other river in this country or in the world to which so many millions of producers and shippers and consumers look as a vehicle of cheap and stable transportation. When improved in accordance with the plans of the Mississippi River commission, that royal river will be the great regulator of interstate commerce, and will exert an appreciable influence on rates of freight from our own ports to those of foreign countries.

Congress has already recognized its claim to separate consideration in the creation of a commission especially charged with the making of plans for its permanent improvement. No such action has been taken in respect to any other of our rivers; no such action has been sought in behalf of any other. The Mississippi is without a rival among the rivers. Candidates for the Presidency in their letters accepting the nominations tendered to them by their parties, Presidents of the United States in their messages to Congress, have expressed and emphasized their devotion to the Mississippi. In fact its right to distinctive recognition has never been challenged save by the Committee on Commerce of this House.

The Senate at the present session has given expression to a sentiment that has been thoroughly crystallized in the minds of the people of the Mississippi Valley, by passing a separate bill appropriating \$5,000,000 for the improvement of the Mississippi River, and \$1,000,000 for the Missouri, one of its principal tributaries. I admit that its provisions are amenable to some objections, but its underlying principle, to wit, that separate appropriations should be made for the Mississippi system of rivers, I regard as a correct one, and I am glad that the other House of Congress at least has shown its loyalty to the people by undertaking to carry out their wishes as voiced by all the chambers of commerce in the Mississippi Valley and by the several conventions held in the interest of this great improvement. It has remained for this House, whose members are the immediate representatives of the people, to ignore their wishes and to frustrate the effort of the Senate to divorce the appropriation for the Mississippi from the river and harbor bill. Whatever appropriation, therefore, is obtained must be through the bill pending before us. I am glad the Committee on Commerce has abandoned the design of pressing the passage of the bill under a suspension of the rules, for while I should have voted for it, my judgment is that it should be considered in Committee of the Whole and amended in the particulars which I shall hereafter indicate.

In view of the fact that whatever appropriation is made for the Mississippi must be in conjunction with the other rivers, great and small, of the country, I insist that the amount appropriated for its improvement should not be graduated by the amounts allotted to smaller and less important rivers, or that it should be affected by the fact that a maximum sum has been arbitrarily fixed by a committee as the sum which should be expended on our rivers and harbors, but that an appropriation adequate to the execution of the plans formulated for the improvement and in some measure commensurate with the commercial importance of that great river should be made.

I shall not consume the time of the House in complaining that the Committee on Commerce has exercised an unwarranted spirit of liberality in regard to the improvement of rivers of minor importance. I simply call attention to the fact that the amount appropriated by the river and harbor bill for the fiscal year ending June 30, 1881, was \$8,976,500, and that the aggregate of the last river and harbor bill was \$11,451,308 as against \$12,419,875, which it is proposed to appropriate by the present bill independent of the appropriation for the Mississippi River. In 1880-'81 the total appropriations for the Mississippi River were \$733,000, and in 1881-'82, \$1,921,000 inclusive of \$1,000,000 solely appropriated for the prosecution of the work of the Mississippi River commission. While this latter appropriation was the largest which the Mississippi has ever received, it was by no means adequate to its requirements or its commercial importance, nor did it represent a proper proportion of the entire river and harbor appropriations for that year.

The pending bill proposes to appropriate the sum of \$4,123,000 for the improvement of the river from the head of the passes to Cairo. This item is a just and proper one, but the amounts which the bill proposes for the river north of Cairo are too small, and in comparison with the millions drowned in rivers, rivulets, and creeks, of the existence of which the world at large will ever remain ignorant, they appear insignificant. I repeat, I do not wish to be understood as complaining of the rather profuse liberality of the committee in its treatment of other improvements, for I favor substantial appropriations in the interest of good navigation and in the promotion of commerce for all the rivers and harbors in whatsoever part of the country they may be. I am certain the committee intended to frame a bill which would be just in its provisions to all parts of the country. I appreciate the difficulties and embarrassments which attend the preparation of a river and harbor bill, and how utterly impossible it is to satisfy all sections of the country. But, Mr. Speaker, I am fully impressed with the belief that an effort to conciliate a multitude of supposed divergent and antagonistic interests, or a disposition to solve the doubt in favor of the merit of the claim presented by every river and harbor in the land where such doubt existed, has resulted in a denial of complete justice to the Mississippi.

Up to the year 1875 the whole amount appropriated for the Mississippi River was insignificant. Determined and well-concerted efforts in its behalf have only been put forth by the people of the Mississippi Valley States within the last seven years; but now the people of these States, who constitute more than one-half of the entire population of the United States, demand that the Government render their great inland sea subservient to the requirements of their great and rapidly growing commerce. And the voice of twenty-eight million people, speaking in behalf of themselves and of breadless multitudes in foreign lands, should certainly be potential.

Some gentlemen seem to regard the demands of the valley States as extravagant, but, Mr. Speaker, they appear modest indeed in view of their material and political power. Endowed with inexhaustible riches of soil and favored by nature in every conceivable manner and settled by a thrifty population, these States have now a representation of one hundred and thirty-seven of the two hundred and ninety-two members of this House, and in the next Congress they will have one hundred and fifty-seven out of a total membership of three hundred and twenty-five. And in this calculation I omit Texas, which will have a representation of eleven members in the next House and which is essentially a Mississippi Valley State.

Nearly all the cotton and sugar and tobacco produced in the United States are grown in the Mississippi Valley. I have been furnished by the Agricultural Department with a comparative statement of the production of corn, wheat, and oats, constituting about 99 per cent of the cereals of this region, for the years 1869, 1879, 1880, and 1881. I call attention first to the production of 1869. The total amount of corn grown in the United States in that year was 760,944,549 bushels, and of this amount the Mississippi Valley States produced 575,360,379 bushels. The production of wheat for the same year was 287,745,626 bushels, of which these same States produced 210,191,162 bushels, or 73 per cent. of the entire crop. The yield of oats, furthermore, was 282,107,157 bushels, of which 174,198,806 bushels were the product of the Mississippi Valley.

Without giving the details of the production of corn, wheat, and oats for the years 1880 and 1881, as furnished by the Department of Agriculture, I mention merely the total production of these cereals in the United States and the Mississippi Valley States. For the year 1880 it was 1,717,434,543 bushels of corn for the United States and 1,366,363,949 bushels for the Mississippi Valley States; 498,549,863 bushels of wheat for the United States and 371,593,859 bushels for the Mississippi Valley States; and 417,885,380 bushels of oats for the United States against 282,121,789 bushels for the Mississippi Valley States. In 1881 the production of corn was again for the United States 1,194,916,000 bushels and for the Mississippi Valley States 954,322,000 bushels; of wheat it was for the United States 380,280,000 bushels and for the Mississippi Valley States 264,915,350 bushels; and of oats it reached for the United States 416,481,000 bushels as against 281,026,000 bushels produced in the Mississippi Valley. Another factor of importance in the commerce of the country is the production and shipping of hogs, and the extent of this industry is best exhibited by a few figures taken from Mr. Spofford's almanac for the last four years. The total production of hogs in the United States during this period was, for 1876-'77, 10,265,413, of which 7,409,174 were produced in the Mississippi Valley States, 2,551,239 in the Eastern States, and 305,000 in the Pacific States; for 1877-'78, 12,620,236, of which the West produced 9,048,566, the East 2,703,670, and the Pacific slope 310,000; for 1878-'79, 14,480,703, of which the Western States produced 10,858,692, and the Eastern States 3,222,011; for 1879-'80, 14,896,245, of which the West produced 11,001,699, the East 3,524,546, and the Pacific States 370,000.

With regard to the agricultural production of the United States, and especially of that of the Mississippi Valley States for the year 1879—a decade later—I append here the following statement of the statistician of the Agricultural Department:

TABLE A.—Crops of 1881.

States.	Corn.	Wheat.	Oats.
	<i>Bushels.</i>	<i>Bushels.</i>	<i>Bushels.</i>
West Virginia.....	12,980,000	4,413,000	2,098,000
Kentucky.....	51,624,000	8,625,000	6,524,000
Ohio.....	79,760,000	38,520,000	25,060,000
Michigan.....	25,068,000	21,220,000	18,057,000
Indiana.....	76,618,000	31,353,000	15,711,000
Illinois.....	176,733,000	26,822,000	66,094,000
Wisconsin.....	29,040,000	17,987,000	31,204,000
Minnesota.....	16,252,000	35,952,000	23,760,000
Iowa.....	173,289,000	18,248,000	42,434,000
Nebraska.....	58,913,000	13,840,000	6,976,000
Kansas.....	76,377,000	19,909,000	8,754,000
Missouri.....	93,069,000	20,399,000	22,783,000
Arkansas.....	21,028,000	1,017,000	2,337,000
Tennessee.....	36,232,000	6,408,000	6,726,000
Mississippi.....	17,646,000	197,000	2,185,000
Louisiana.....	9,693,000	5,350	364,000
Total.....	954,322,000	264,915,350	281,026,000
Aggregate for the United States....	1,194,916,000	380,280,000	416,481,000
Per cent., Mississippi Valley States.	79.9	69.6	67.5

This, however, is but an incomplete statement of the enormous production of the farms of the Mississippi Valley. Its mines of iron, lead, nickel, and copper make, besides, annually their contribution of millions of dollars to the wealth of the country.

The iron mines of Iron Mountain, Pilot Knob, and the lead mines of Mine La Motte, Saint Joe, Desloge, Old Mines, and Joplin, in Missouri, and the iron and lead mines in Michigan, Illinois, Kentucky, Tennessee, and West Virginia are known throughout the world. Its manufactures, too, although they are as yet in their infancy, begin to obtain an unexpected prominence, and they already swell largely the volume of its commerce. A few years ago the East

had almost a monopoly of the manufactures of the country. But now it has a formidable rival in the rapidly-increasing net of factories in the West in the manufacture of cotton fabrics, and in that of steel, iron, and other metals, and even in that of plate-glass. The plate-glass works at Crystal City, thirty miles below Saint Louis, at the confluence of Platin Creek with the Mississippi River, surpass in extent and the capital invested in them any similar establishment in the United States. Their yearly production reaches several millions of dollars, and to more than a thousand workmen they give constant and remunerative employment. The iron works of Carondelet and numerous other manufacturing establishments are well known throughout the country. The industries of the cities of Saint Louis, Chicago, Cincinnati, Louisville, Milwaukee, and New Orleans furnish to-day employment for 231,706 laborers.

In the absence of unfriendly legislation there can be no reasonable doubt that within a few years manufactories of the west will rival any similar establishments in the world in the quantity and number of products.

I do not wish to unnecessarily detain the House, but I wish to mention another reason why the demands of the Mississippi Valley States should be acceded to. And this reason relates exclusively to their character as tax-payers. The whole amount of internal revenue collected of the people of the United States for the years 1879, 1880, and 1881 reaches the grand sum of \$341,233,222, of which \$106,933,367 were collected in 1879, \$116,848,220 in 1880, and \$127,450,635 in 1881. Of this amount the Mississippi Valley States paid in 1879 \$58,766,417, in 1880 \$69,032,405, and in 1881 \$75,668,681. If ever figures possess the power of speech, these figures must proclaim the exceptional importance of that grand zone of States which stretches from the confines of British America to the Gulf of Mexico. Of comparatively recent growth, they surpass to-day in the wealth of their productions the older States of this Republic, and they furnish far more than one-half of our immense governmental revenues.

The annals of our customs service demonstrate only too clearly that the bulk of our export trade has its source in the Mississippi Valley, and that of our foreign importations this very valley consumes a share far surpassing that of the old colonial States. The taxation to which the Mississippi Valley States are annually subjected for national, State, and local purposes, directly and indirectly, develops figures which thirty years ago would have been looked upon as beyond the reach of human possibilities. The internal-revenue system alone—and I may be pardoned for expressing here my abhorrence of that system—that detestable tax system of which, while advocating its abolishment, the gentleman from New York, [Mr. Cox,] whose unfaltering devotion to the cause of the people and whose intrepid and heroic defense of the principles of pure government have illustrated his long and brilliant service in this House, said only recently with that fervid eloquence for which he is so distinguished:

I favor openly and boldly the entire abolition of the cumbrous, corrupt, and spying system of the internal revenue. It is not necessary to say that its officers are corrupt; it is the system. Its officers pursue the voter into his cigar and tobacco shops and into stills, breweries, and factories with threats; and it has its army of 5,000. Worse than the janizary or the mameluke, it undertakes by its occult machinery to intimidate and defraud. Away with it! Every speck of it on our body-politic is a cancer. I am willing to meet this issue at the polls; and woe be to that member who upholds it to overfill our Treasury that the greedy may riot in the people's hard-earned means collected by its officials!

That vicious system which has so forcibly been denounced by the gentleman from Pennsylvania [Mr. KELLEY] as unworthy a free people in the time of peace and as in violation of the spirit and intentions of the framers of our Constitution; that "infernal system," to use the words of my friend from Georgia, [Mr. SPEER,] which has bred countless numbers of spies, informers, and office-holders, who have so often rendered themselves odious to the people by their tyrannies and their disregard of individual rights, if not by open perjury and other iniquities; that worst of all systems of taxation by which the citizen is subjected to burdens in an indirect way to which he would never openly submit, and for the extirpation of which I shall never cease to labor—that system alone secures to the Government a revenue from the valley States equal to two-fifths of its yearly expenditures.

In view of these facts, does any gentleman think our demand for the permanent improvement of our great water-way unreasonable?

Mr. Speaker, as I have stated no measures for the radical improvement of the river were adopted until 1875. Congress then, forced by public sentiment, recognized its claims to systematic and permanent improvement by passing the jetty bill. By that bill and the \$5,500,000 which it appropriated a system of gigantic improvements was inaugurated at its mouth at the head of the passes, and under the direction of Captain James B. Eads, one of the ablest of modern engineers, it was in a few years successfully completed. The sand-bars which formerly obstructed the navigation in the delta of the Mississippi have by a grand system of dredging been permanently removed, and the port of New Orleans possesses now a channel of a depth in every way sufficient for the requirements of the largest sea-going vessels. Grand as was this achievement it was, however, by no means the only important improvement of which the Mississippi stood in need. It was and could only be the beginning of a chain of improvements along its whole course. Numerous were the impediments

to its navigation between New Orleans and Cairo, and not less dangerous was its bed between Cairo and Grand Rapids and the Falls of Saint Anthony. To remove these obstacles to its navigation, obstacles which had caused the loss of thousands of lives and the destruction of millions of property, could only be the work of experts who were thoroughly familiar with the river's topography and invested with ample authority for the enforcement of a uniform, harmonious system of improvements; and it was this necessity which led in 1879 to the enactment of a law for the survey of the Mississippi River and the appointment of a commission of experts charged especially with the duty of determining and devising a comprehensive plan for its improvement. This commission was to consist of seven members, to be appointed by the President, of whom one should be selected from the Coast and Geodetic Survey and three each from the Engineer Corps of the Army and from civil life. Section 3 of the act creating this commission provides that—

It shall be the duty of said commission to direct and complete such surveys of said river, between the head of the passes near its mouth to its headwaters, as may now be in progress, and to make such additional surveys, examinations, and investigations, topographical, hydrographical, and hydrometrical, of said river and its tributaries, as may be deemed necessary by said commission to carry out the objects of this act.

And section 4 of the same act reads as follows:

It shall be the duty of said commission to take into consideration and mature such plan or plans and estimates as will correct, permanently locate, and deepen the channel and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof, prevent destructive floods; promote and facilitate commerce, trade, and the postal service; and when so prepared and matured, to submit to the Secretary of War a full and detailed report of their proceedings and actions, and of such plans, with estimates of the cost thereof, for the purposes aforesaid, to be by him transmitted to Congress: *Provided*, That the commission shall report in full upon the practicability, feasibility, and probable cost of the various plans known as the jetty system, the levee system, and the outlet system, as well as upon such others as they deem necessary.

The President, in pursuance of the authority vested in him, appointed a board of experts, composed of the most distinguished engineers in the country. These experts met for the first time on the 19th of August, 1879, and immediately took into consideration the survey of the river "already in progress." On the 6th of March, 1880, the commission, through its president, General Q. A. Gilmore, transmitted to the Secretary of War a preliminary or partial report, in which it stated that it was found that the portion of the river lying above the mouth of the Ohio had been essentially covered by the several shore-line surveys already completed, or drawing to a close, so that its attention was directed more especially to the lower river between Cairo and the head of the passes. For this section of the Mississippi the commission conceived the plan to which it has since adhered of causing the river to scour out and maintain a channel through the shoals and bars existing on those of its parts where its width is excessive, and to build up new banks and develop new shore lines, so as to establish, as far as practicable, the requisite conditions of uniform velocity for all its stages of high and low water, the theory of the commission being, that "uniformity of width, secured by the contraction of the channel, would produce increased velocity and thereby also increased erosion of the bed of the river at its shoal places, accompanied by a corresponding deposit of silt at its deep places, and consequently by a greater uniformity of depth." The design of the commission, as appears from that report, and from its subsequent reports, tends to the contraction of the low-water channel-way of the Mississippi to a width of three thousand feet, by means of hydraulic contrivances, and to the effective scouring out and deepening of this channel.

In its reports the commission discussed also the theory of levee improvements, and with regard to their utility and effect upon the navigation of the Mississippi it uses the following language:

In a restricted sense, as auxiliary to a plan of channel improvement only, the construction and maintenance of a levee system is not demanded. But in a larger sense, as embracing not only beneficial effects upon the channel but as a protection against destructive floods, a levee system is essential; and such system also promotes and facilitates commerce, trade, and the postal service.

The corrective system proposed by the commission for the Mississippi looks to a conservation of the flood waters of the river and their concentration into one channel, which shall have a uniformity of width, and hence conflicts with that other system mentioned in connection with the Mississippi correction—the so-called outlet system.

The commission considered this latter system in all its bearings, as the act of its creation required it to do, and it rejects it. I do not believe that there is any considerable opposition in either House of Congress, or indeed in the country, to the theory enunciated by the commission as to the effect of the outlet system. I shall cause to be inserted here as a part of my remarks the report of the commission on this system, which has been with so much earnestness and persistency pressed upon the attention of certain committees of the House during the present session. I regard this report as the best reply that can be made to the arguments advanced by the advocates of the system:

It has been supposed by many persons that, because the immediate effect of a crevasse during a flood is the reduction of the height of the river's service in the vicinity of the crevasse and below it, lateral outlets, either natural or artificial,

by which the flood waters of the river are drawn off and conveyed through a shorter route to the sea, tend to prevent the recurrence of destructive floods by supplying additional avenues for their escape. This method would undoubtedly be effective if the flood waters of the Mississippi were not highly charged with sedimentary matters, which are held in suspension in the water by the current. To support this immense mass of earth and sand in suspension, and thus insure its transportation to the Gulf, the velocity of the current must be sustained.

Without stopping to determine, or even discuss, the character of the relation which exists between the various velocities of current, and the proportionate quantities of sediment which such velocities are capable of carrying in suspension, the fact seems to be established that, when the current is checked in its natural flow during floods, a deposit of sediment will occur. Shoals are found in the river immediately below crevasses, which it is difficult to refer to any other cause than the loss of current velocity which takes place below the crevasse. As a portion of the volume of the river is drawn off by the crevasse when it is first made, it is impossible that the current below the crevasse can then be as rapid as it was before its occurrence. Being less rapid, it is unable to sustain the whole quantity of matter held in suspension by the more rapid current above the outlet, and consequently its surplus sediment falls to the bottom below the crevasse. This deposition continues until the size of the river below the crevasse has been so reduced by the shoaling that the current is again restored through the short distance in which the bottom of the river has been thus raised, and the channel diminished. If the crevasse remained open, however, for several years, it is evident that the shoal will continue to extend down the stream, for the reduced velocity will still exist in the river below the shoal. If the crevasse be kept open indefinitely, the shoaling will continue to extend down the stream until certain other injurious effects are produced, which will be presently referred to.

It is a well-established law of hydraulics that the ratio of frictional resistance per unit of volume increases if the sectional area be diminished. Thus, if the volume of the river were suddenly divided by an island into two channels, the water flowing in them would encounter more frictional resistance than it met with while flowing in a single channel. Hence the currents through these channels would be more sluggish. As the water is charged with sediment the sluggish current would cause a deposit in the channels which would first begin at their upper ends, and would continue until the bottoms of the two channels would be so steepened that the current would attain a velocity capable of carrying the suspended sediment through them without further deposit. If the two channels were of nearly equal length and size they would probably remain permanent, and the slope of the river's surface in flood time would be found to be steeper through them than above and below, where the volume flows in a single channel. If one of the two channels were materially longer than the other, the effort of the river to increase the steepness of the longer channel would be abortive, because its slope would be controlled by the shorter one. A shoal in the upper end of the long channel would, however, be built up to such height by the depositing action of the sluggish water in it, as finally to shut it off altogether from any connection with the river, while the still water at the lower end of such channel would promote the deposition of sediment at that end to such an extent as to build it up also, and thus completely separate the long channel from the main body of the river; in the mean time the shorter channel would have enlarged so as to accommodate the entire river. The longer channel would, in this event, constitute a lake, like one of the many lakes which are seen on a map of the alluvial basin of the river. Being removed from the influence of overflows, these lakes remain deep and clear for many centuries. The phenomenon just described invariably accompanies the formation of a cut-off. When one of these occurs, the volume of the river is at first divided into two channels of unequal length, an island being left between them.

In the case of a crevasse an island is also formed, having the main body of the river on the one side of it, and the crevasse channel on the other side. As the volume flowing in the main channel below a crevasse has been decreased by the amount drawn off through it, a steeper slope in the main river, if the crevasse be kept permanently open, becomes inevitable; because the shoal below the outlet, as it grows in length down stream from the deposition of successive floods, gradually increases the frictional resistance of the volume flowing through that diminished channel, and this tends to check the current of the river above the crevasse, and thus the shoaling of the river bed and the raising of the flood line above the site of the outlet ensue as a secondary and permanent effect.

It is in this way that silt-bearing streams flowing through alluvial deposits have the ability to increase or steepen their surface slopes, and thus recover the velocity of their currents and adjust them to the work of transporting the sedimentary matter with which the flood waters are charged so that this matter may be carried without loss or gain. In proof of the correctness of these views, and of their full accordance with well-established hydraulic laws, we have the evidence of this relation between slope and volume presented in the phenomena of silt-bearing streams all over the world. Wherever such streams flow through alluvial deposits, other conditions being the same, the slope is least where the volume is greatest; and, conversely, the slope is found to be invariably increased as the volume is diminished. The Mississippi throughout its alluvial basin, not only in its main trunk but in all of its outlets, presents no exception to this peculiar feature. Among numerous illustrations of this law the following examples may be cited.

The fall of the Atchafalaya is about six inches per mile from its head to the Gulf level, while the fall of the Mississippi from the same point is less than two inches per mile. The volume of the Atchafalaya is only about one-twelfth as great as that of the Mississippi where they separate. The fall of the South Pass is three inches per mile, while that of the Southwest Pass is but two inches per mile. The volume of the South Pass is only about one quarter as large as that of the Southwest Pass.

As water selects the line of least resistance in flowing from a higher to a lower level, it follows that inasmuch as that portion of the Mississippi floods which enters the Atchafalaya seeks the Gulf level through a route not half so long as that which follows the main river, and as it has a descent threefold greater than the portion that flows in the main river, the resistance in the shorter and steeper route of the Atchafalaya must be so much greater that these elements which tend to increase the current are so far neutralized as to produce in both routes to the sea that rate of current which is capable of transporting the sediment without loss or gain to the Gulf level, and thus a condition of equilibrium is established between these two routes to the sea.

It seems unnecessary to state that the ratio of frictional resistance to the volume of water resulting from the smaller size of the Atchafalaya is so much greater than that in the main river that this condition of equilibrium or regimen of the two channels is the result. Anything which will tend to increase the flow permanently through either route would, if unchecked, have a tendency to cause the entire river to find its way, ultimately, through that route to the sea, by lessening in it, as it enlarged, the ratio of frictional resistance to the volume of water flowing in it. The sub-delta-building ability of the smaller passes, by which they prolong their length and thus flatten their slopes, will invariably tend to cause their extinction. This explanation of the relation between slope and volume is, of course, applicable to the other existing outlets referred to in this connection. For this reason the commission believes that no surer method of ultimately raising the flood surface of the river can be adopted than by making lateral outlets for the escape of its flood waters. The raising of the flood surface necessitates an increase in the height of the levees and leaves shallower channels for navigation.

Mr. Speaker, I trust that hereafter Congress will not have forced upon its attention nor be urged to adopt the peculiar views of gentlemen who believe that a plan different from that of the commission should be followed.

On this question I believe we are all in substantial accord with the commission. The only opposition which its plans are likely to meet will doubtless arise from a diversity of opinion as to the utility of levees. But the bill pending before us expresses in every way the sentiment of those who are opposed to the construction of levees because incidentally some riparian proprietors may be benefited by them. It directs that "no portion of this appropriation shall be expended to repair or build levees for the sole and exclusive purpose of reclaiming lands and preventing injury to lands by overflows, provided, however, that the commission is authorized to repair and build levees, if in its judgment it should be done as a part of its plan to afford ease and safety to the navigation and commerce of the river and to deepen its channel." It would seem that these provisions ought to satisfy the most fastidious among the objectors to levees as a part of the plan for the general improvement of the Mississippi River.

We have already given an earnest of our faith in the methods presented by this able board of engineers, and nothing less than prosecution to its completion of the work designed by it will satisfy the country.

The commission finding, as stated, that the portion of the Mississippi lying above the mouth of the Ohio had already been surveyed by the United States Engineer Corps, directed its attention in the first instance to the river below Cairo; but later it extended its observations also to the Upper Mississippi. In its second report to the Secretary of War the commission approves the operations conducted by Major O. H. Ernst, than whom, as regards the execution of difficult problems of hydraulic engineering, no more competent expert could be found in the country, and to whom the work of improving the Mississippi between the mouths of the Ohio and the Missouri is intrusted; and in an equal manner it also commends those of Captain A. Mackenzie, who has charge of the Mississippi correction between the Falls of Saint Anthony and the mouth of the Missouri.

The phenomena of caving banks and changes of the river-bed found in the Lower Mississippi are also found in that portion of it which extends from the mouth of the Missouri to that of the Ohio, and the commission reports Major Ernst as putting into practical operation its theory of channel improvement, as especially devised for the lower portion of the river. No doubt is entertained by the commission that the operations of Major Ernst will result in giving to the Mississippi River a low-water depth of at least ten feet between Saint Louis and Cairo—the depth originally designed—and it recommends liberal appropriations for the rapid completion of this work.

The last river and harbor bill (act of March 3, 1881) allotted \$600,000 for channel improvement, \$10,000 for extra work at Cape Girardeau, besides reappropriating the sum of \$33,354.70 for the improvement of the harbor at Alton. The bill now under consideration provides \$600,000 for this section of the river. It will be seen that while the lower river has its appropriation increased fourfold, this part of the river has not by some \$43,000 as much as it received under the act of last year. The engineer in charge estimates the amount necessary to carry on the work during the ensuing fiscal year to be \$1,000,000. This estimate has received the sanction of the Chief of Engineers; but the committee, thinking perhaps that somebody might be surprised at the size of the river and harbor bill if all parts of the Mississippi were provided for in accordance with the estimates of the engineers and as the commercial importance of the river demands, has recommended less than 60 per cent. of the amount of the estimates. Thousands of dollars have already been absolutely wasted by the failure of Congress, prompted by false ideas of economy, to appropriate annually sufficient amounts for the prosecution of work on the Mississippi. The original estimate of the cost of this improvement was \$7,684,200, but this estimate was based upon the supposition that funds would be provided as rapidly as they could be judiciously expended. The work ought to be completed in eight years from its inauguration. But, in the language of the engineer in his report for 1879—

With annual appropriations of only a few hundred thousand dollars this improvement will be the work of a century, and will cost fully \$20,000,000.

I say, Mr. Speaker, there is no economy in doling out the money for this great work in such a way as to prevent the employment by the engineer of all his resources for carrying out his plans. I wish the committee had read the following in the report of Major Ernst for 1880:

Leaving out of account the immense financial advantages to the Government and the public which will result annually from securing cheap through transportation at the earliest possible moment, it may be stated that the work will be accomplished with least outlay by six annual appropriations of \$1,000,000 each. The less the annual appropriation the greater the final cost.

He states further that the forces which have imperiled the navigation of this portion of the river are constantly at work, and that the question involved is not simply whether better navigation shall

be secured but whether such as now exists shall be preserved. He says:

The works required to accomplish the one object may be made to accomplish the other. The longer the execution of them is postponed the more there will be to do, and the slower the progress the more they will cost.

It is a well-known fact that the navigation between Saint Louis and Cairo is worse than it is below; and I say there is no apology for cutting down the estimate. Major Ernst says in a letter to me that \$1,000,000 expended above Cairo during the coming year will be of more general benefit to the entire navigation interest of the whole river than the same amount, or even one considerably greater, would be if expended below.

The people of the Mississippi States demand adequate appropriations for their great river, not at one point on the river but from its source to its mouth. I intend at the proper time to offer an amendment increasing this appropriation from \$600,000 to \$1,000,000. I also regard \$200,000, the amount in the bill for the improvement of the river from the mouth of the Illinois to Des Moines Rapids, as entirely too small. It seems upon its face to be larger than the appropriation of last year, but it is not.

There was allotted in the last river and harbor bill the sum of \$175,000 for the improvement of the general navigation of the river between the points indicated, but the following additional appropriations were made for channel improvement at special points: at Alexandria, Missouri, \$6,000; at Guttenberg, \$5,000; at Hannibal, Missouri, \$20,000, and at Quincy, \$10,000. The engineer, Captain McKenzie, in charge of this work recommends an annual appropriation of \$500,000, and the Committee on Commerce proposes to give \$200,000, or 40 per cent. only of the amount actually needed for general channel improvement, and nothing on the estimates for channel rectification at particular points. The work to be done and the magnitude of the interests involved called for more liberal action on the part of the committee. This item ought to be increased to the full amount of the estimate.

I say, then, Mr. Speaker, while the committee has done well for the river south of Cairo, for some reason, I know not what, it has not come up to the height of this great argument and dealt with the entire river with that profuse liberality which, without meaning to be offensive, I must say has characterized its treatment of some of the unknown rivers of the country. I intend, also, to submit an amendment increasing the item for continuing the survey of the Missouri River from its mouth to Fort Benton, Montana, from \$25,000 to \$50,000. Twenty-five thousand dollars is less by \$5,000 than has ever been appropriated for this work, and the engineer in charge of it informs me that \$30,000 is too small a sum with which to prosecute the survey economically, this being a topographical and hydrographical survey of the entire valley of the river, checked and connected by a system of triangulation from one end to the other, as the report shows, it is necessary to keep employed a number of skilled assistants, the expense of which, together with that required for maintaining and keeping in repair a steamboat and other paraphernalia for transporting and subsisting, at times, a large party of men, when subtracted from an appropriation of \$25,000, leaves a very small sum for the prosecution of work in the field. In a letter which I received from D. W. Wellman, United States assistant engineer in charge of the survey, he presents this matter in a very strong light. He says:

The economical way to carry on this work is to have funds enough at one time to keep a party in the field from the beginning to the end of the season. A party will then attain the highest efficiency in the work, and can accomplish much more in a given time, and the expense of preparation and organization will be no greater for six months' field work than for two.

I also propose to offer an amendment, striking out \$800,000 and inserting \$1,000,000 for the improvement of the Missouri River from its mouth to Sioux City, Iowa, and I am sure it will meet with favorable consideration. It is only necessary to get gentlemen to examine the exhaustive and very able report submitted by Major Charles R. Suter, of the United States Engineer Corps, and to consider the immensity of the commerce to be benefited by the judicious expenditure of a few millions of dollars, to induce them to vote the full amount of the engineer's estimate for this work. For the first time a plan has been devised for the rectification and permanent improvement of the channel of the Missouri River. It is not creditable to Congress that it has never recognized the superior claims of this one of the grandest rivers on the continent, or indeed in the world, to governmental aid.

Streams whose geographical position cannot be determined by an examination of any map have been liberally provided for; artificial water-ways have been lavishly cared for, but the great and majestic Missouri, susceptible of an improvement which can be made at a moderate cost, that will give it a low-water depth of twelve feet from its confluence with the Mississippi to the mouth of the Yellowstone, a distance of 1,682 miles, and a depth of six feet 600 miles beyond, has heretofore been, strange to say, left without any provision.

The plan adopted by the engineer looks to a decrease of the high-water width of the upper river and to the bringing of it within certain limits, which limits are to be increased as the volume of water is increased on the lower river, and which will result in also contracting the low-water channel and causing the water to remove the obstructions to its passage. The channel will thus become uniform

in width and depth, and its location will be permanent at all stages of the river. The estimated cost of improving the river from its mouth to Sioux City, a distance of seven hundred and eighty-one miles, is \$7,810,000, or \$10,000 a mile—a trifling amount, indeed, when we consider the splendid results which are to be wrought by its expenditure. The improvement, when effected, will be of such incalculable benefit to so many millions of people whose surplus products await some avenue of escape to the markets of the world; it will reclaim so many miles of the most fertile land on the earth, and make so many thousands of farmers owners of the soil without condition and not tenants at the will of a capricious river, that we ought not to delay the completion of the glorious work planned by the engineer.

Mr. Speaker, let me impress one fact upon this House. This estimate is based upon the presumption that some attention will be paid to the annual recommendations of the engineer, and that the amount which he believes can be advantageously and with economy expended in any one year will be appropriated. This work can be completed and ought to be completed in eight years, and the Congress of the United States must screw its courage up and provide, not within a few hundred thousand dollars of the annual estimates, but the whole amount which in the judgment of the engineer is needed for the prosecution of the work in any one year.

There is no economy in any other course. If the river and harbor bill must be kept within a prescribed sum, let us go to the less important rivers, for which Congress has already with a lavish hand provided, and make the deduction from the estimates for their improvement, and not take from the Missouri, which, for the first time in the history of the country, has received the recognition of a survey to determine a plan for the improvement of its navigation. Let us not deny justice to a people from whom justice has been so long withheld. And now, at the hazard of wearying the House, I shall say a few words on the practical benefits to follow the permanent improvements of the Mississippi and its tributaries, although I know this subject has been so often and so thoroughly discussed that it is not possible to suggest any new thought upon it.

That water routes afford the cheapest and best means of transportation for all heavy and bulky commodities, and that they are the natural competitors of railways, and hence the regulators of railway freights, is universally admitted. The Mississippi River and its tributaries, in their unimproved condition, and with their imperfect facilities for handling commerce, exemplify the truth of this statement, and the greatest commercial nations of Europe also attest its truth.

In a report made by the Senate committee on transportation to the seaboard it is stated that the railway companies now carry wheat from the trans-Mississippi States to the seaboard, each car averaging about twelve round trips and delivering one hundred and twenty tons of grain in one year; that the same car can make fifty trips to the nearest river ports and deliver five hundred tons of grain in the same time. With the barge system the surplus grain and other commerce can be carried down the Mississippi River to the Gulf of Mexico cheaper than at ocean rates, thus making the grand railway system of the Mississippi Valley five times as efficient in local traffic and practically five times as profitable.

I read from the report of the Senate committee:

The railway system of our country has accomplished gigantic results of incalculable value and benefits; that the improvements proposed will not affect the great trunk railway lines unfavorably from the Mississippi River to the seaboard, as they now have and always will have all the business they can do to make the capital in their construction remunerative and very profitable.

In a circular issued by the Board of Transportation of the city of New York dated May, 1881, it is stated that the rate per bushel for freighting from Saint Louis to New Orleans by barge is 5 cents, while the pool rate by rail to New York from Saint Louis is 20 cents per bushel. The average of freight from New Orleans to Liverpool is about 6 pence per bushel; from New York to Liverpool, 4½ pence; so it appears that grain is carried from Saint Louis to Liverpool via New Orleans for 17 cents per bushel, while it costs to transport via New York 29½ cents. From Saint Paul the rate through to Liverpool via New Orleans is 27 cents, while via New York it is 42½ cents.

This showing is very encouraging to the friends of river improvements, but the freight from Saint Louis to Liverpool instead of being 17 cents is only about 14 cents per bushel, as shown by the report of the secretary of the Merchants' Exchange of Saint Louis, made December 31, 1881. It thus appears that a bushel of grain is carried to Liverpool from Saint Louis by the way of New Orleans for 15½ cents less than it can be carried to the same place by the way of New York, and that in fact it is carried to Liverpool for 6 cents less than it costs to take it to New York City.

But, Mr. Speaker, it is not necessary to elaborate this argument. The House and the country understand the benefits which will result to the people by promoting a healthy competition between the railroads and the water-ways of the country. In order to effect this, navigation must be rendered less expensive and less precarious by improving the channels of our great water highways.

The farmer in his field, the laboring-man in the mine and at the forge, the merchant and the manufacturer, are alike interested in cheap transportation, and with one voice they demand it.

Justice to the Mississippi River—Protection to the people on its borders.

SPEECH

OF

HON. CHESTER B. DARRALL,

OF LOUISIANA.

IN THE HOUSE OF REPRESENTATIVES,

Friday, June 9, 1882,

On the levees and improvement of the Mississippi River.

Mr. DARRALL said:

Mr. SPEAKER: The Committee on Levees and Improvements of the Mississippi River, of which I have the honor to be a member, have given to the subjects committed to their charge the most careful investigation and consideration.

Under the rules of the House, and by direction of the Speaker, the report of the Mississippi River commission for the last year, various bills for rebuilding levees, making outlets, and improving the great river, bills making appropriations in accordance with the recommendations of that commission, and finally the special message of the President of the United States recommending an appropriation for closing the gaps in and repairing the levees have all been referred to that committee and have been fully considered. More than this, the committee, feeling the importance of the matter confided to their care, and the immense interests at stake, decided early in the session to go outside of the printed reports and opinions laid before them. They therefore asked the several members of the Mississippi River commission to come before them and explain fully what had been accomplished thus far, and what were their ideas and plans for further carrying out the provisions of the law creating the commission under which they are acting.

The committee have also heard the statements of other gentlemen eminent as engineers and having large experience and observation of the river and its condition and needs, some of whom differed widely from the members of the commission as to the best methods to be pursued in order to carry out the objects sought for, that is, to improve and give ease and safety to the navigation of the river, and to deepen and permanently locate its channel, protect its banks, and prevent destructive floods. To the latter proposition, that is, the prevention of destructive floods, the special attention of the committee, owing to the overflow this year, has been directed, and on this branch of the subject their investigation has been thorough and complete, and I am glad to say that after this thorough investigation, and after examining the reports and hearing the evidence of advocates of both the levee and outlet systems, they have unanimously concluded that the only practical method to prevent the fearful and destructive floods, such as we have just witnessed, is by closing up the gaps and strengthening the whole system of levees from the passes near the mouths of the river to Cairo, or above, if necessary, and by preventing the washing and caving in of the natural banks; this to be accomplished in the manner so successful at points on the upper river by piling and filling in, and using a wire and brush netting placed over the caving portions of banks.

In other words, the committee, after studying carefully the reports of the commission; after hearing the members of the commission and questioning them as to their plans and methods, have come to the unanimous conclusion that the only safe thing for Congress to do is to follow the recommendations of the commission, to appropriate the money they ask for, and allow them, without any restrictions on the part of Congress, to expend it in accordance with their plans and methods.

The commission in their estimates specified the amount required for different reaches or portions of the river where there are shoals and bad low-water navigation, and the amount required for closing the gaps and strengthening the levees. The committee believe the better plan is to make the appropriation for the year in bulk, to be expended by the commission, for the reason that owing to the unprecedented floods of the present year and the many breaks in the levees and the experimental character of much of the work of protecting banks, the moneys to be used had best be left entirely in the hands and at the discretion of the commission. The committee felt the utmost confidence in the engineering skill, the wisdom, and patriotism of the commission, and desired, and so recommend to the House, that they should be left free to use their own judgment. With this view the committee adopted and the chairman reported to the House on the 24th of March the following bill:

A bill making an appropriation for the improvement of the navigation and commerce of the Mississippi River in accordance with the recommendations, plans, specifications, and estimates of the Mississippi River commission.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the following sums of money be, and they are hereby, appropriated, to be paid out of any money in the Treasury not otherwise appropriated, to be expended by and under the direction of the Secretary of War, for the improvement of the navigation and commerce of the Mississippi River:

For the construction, repair, completion, and preservation of certain works on

the Mississippi River between the mouth of the Ohio River and the head of the passes of the Mississippi River in accordance with the recommendations, plans, specifications, and estimates of the Mississippi River commission, \$4,613,000.

For improving the Mississippi River between the mouths of the Ohio River and the Illinois River, in Illinois and Missouri, (continuing improvements,) \$1,000,000.

For improving the Mississippi River between the mouth of the Illinois River and Des Moines Rapids, in Illinois and Missouri, (continuing improvements,) \$500,000.

This bill was reported as long ago as the 24th of March, and it was the desire of the committee that some two or three days for its debate and consideration should be allowed in the House. But the pressure of other business and the fact that under our rules the "Committee on Levees and Improvement of the Mississippi River" has not the right to report an appropriation at any time, has, up to this late date, prevented this discussion. In order, therefore, to obtain certain action our committee have gone before the Committee on Commerce of the House and asked that the appropriation for improvement of the Mississippi River be incorporated in the harbor and river bill now before the House. This has been done as to the full amount asked for, but coupled with it are certain provisos, which, while not hampering or interfering with the duties or work of the commission, are entirely unnecessary. I quote from the harbor and river bill the clause making the appropriation for the Lower Mississippi, and also the provisos annexed, first saying, however, that the Committee on Commerce also have examined and indorsed the plans of the commission:

Improving the Mississippi River: That the sum of \$4,123,000 be, and is hereby, appropriated, or so much thereof as may be necessary, out of any money in the Treasury not otherwise appropriated, for the improvement of the Mississippi River from the head of the passes to Cairo: *Provided*, That no portion of this appropriation shall be expended to repair or build levees for the purpose of reclaiming lands or preventing injury to lands by overflows: *Provided, however*, That the commission is authorized to repair and build levees if in their judgment it should be done as a part of their plan to afford ease and safety to the navigation and commerce of the river and to deepen the channel.

It is difficult at first sight to see the object in these two provisos, if object they have; and only the wisdom of a superabundant caution would have inserted them—the wisdom that would provide that no one could have any fault to find with the appropriation. The second proviso leaves the repairing and building of levees to the discretion of the commission if they consider it necessary to do so in order to deepen the channel and give ease and safety to the navigation and commerce of the river. This is done while it is known to probably every member of the House that the commission have said in their printed reports, both to this and the Forty-sixth Congress, that the building of levees and the closing up of the gaps in those built was the first thing to be done, in order not only to deepen the channel but to prevent destructive floods; the latter object of fully equal if not greater importance than the first.

It is to be presumed that the intention of the Committee of Commerce is to leave the whole matter to the judgment and discretion of the commission, as was done by the Committee on Improvement of Mississippi River, acting with no restrictions except that of the law creating their body. This is to be inferred because of the use of the second proviso, and because the committee in their report to the House use the following language:

For the improvement of the Mississippi River from the head of the passes up to Cairo the bill appropriates all that the commission ask for, the committee believing that this is a work of such vast national importance and of such a peculiar and intricate character that the commission should not only be left unhampered by conditions of any character whatsoever but that it should also have abundant means for the completion of this great work at the earliest possible period.

And with this we of the lower valley are well content. The appropriation of last year of \$1,000,000 remains for the most part unexpended, and, with what is appropriated by this bill, will give the commission sufficient means to close up all or most of the gaps in the levees, as they propose to do, and as is recommended in the special message of the President transmitted to both Houses of Congress April 17, 1882, and will also probably give them all the money they can profitably expend in the work of contracting and deepening the channel as proposed at the several reaches above.

The commission have ready now an extensive plant of all necessary boats and appliances, and are ready, as soon as the water in the river falls, to begin this work of channel improvement. Then, if the suggestion of Captain Eads is followed, and the work of closing the breaks in the levees be at once begun, under the direction of the Secretary of War, from below up, we may expect to see much progress made not only in the improvement of the channel but, by the time of another high water, (by March of next year,) have the levees of the river in such repair as to prevent another destructive flood next year such as we have just witnessed. Unless this be done, and the work energetically pushed, we will have, with all the levees down, a repetition next year of the flood of this. The people of the submerged region will lose what was left them from this year's flood, will lose what little they can make of a crop after the water leaves their lands, and Congress will be called on not to appropriate two or three hundred thousand as was done this year, but that many millions to save life, to prevent starvation; because then, with two floods in succession, they will indeed be utterly destitute.

Before, Mr. Speaker, going into the details of the plans of the commission in their great work, I desire to call the attention of the House to an imperfect and brief description of the great delta of

the Mississippi, the difficulties to be overcome in its protection, and the reasons why this is one of the most important works the nation has to perform. And in giving this description I use information from reports made to Congress, and especially use the statistics compiled by a colleague of mine in a former Congress, Hon. B. H. Lewis, of Tennessee.

According to the census of 1880 the population living immediately on the lands exposed to the floods was 1,884,000. And the question of the protection of these lands from overflow and destructive floods is one of vital importance; I may even say of life and death to these people. Besides this, it is a vital question to the citizens generally of six or seven States which extend into that region, while its direct and ultimate consequences deeply concern the prosperity of all the people of the Mississippi Valley, that immense area embracing twenty-one States, and several Territories soon to be States, and comprising more than one million and a quarter square miles of territory. It is also of the greatest importance to the whole nation, and merits the early and earnest consideration of the National Government, and of Congress especially. It directly affects the interests and prosperity of my constituents, and I feel it to be my duty to ask the attention of the House to some of the reasons why this immense territory should be redeemed and protected. The delta or alluvial lands of the Mississippi, according to the best authorities, comprise an area of 38,706 square miles, or 24,771,840 acres of the most fertile soil on the globe. This is an extent of territory three times as large as the kingdom of the Netherlands; twice as large as Switzerland or Denmark, larger than many other historic States in Europe, and is larger than the combined area of the six States of Massachusetts, Connecticut, Rhode Island, New Jersey, Maryland, and Delaware. Its vast capabilities will be recognized at once when it is mentioned that, with a soil equal in fertility to that of the valley of the Nile, it is seven times as great in area as all the arable lands of Egypt now or at any former period of its history.

In 1860 this region lately submerged by the disastrous floods produced 688,254 bales of cotton, worth \$41,295,240, and 460,000,000 pounds of sugar, worth \$32,200,000. Humphreys and Abbot's survey estimates the yearly capacity of this region for cotton alone, at 10 cents per pound, to be equal to \$315,000,000. At the prices that have prevailed since the war this would amount to about \$500,000,000 annually. Add to this the capabilities for the production of sugar and rice in the lower portion of the delta, south of 31° 31', and the total amount would be almost fabulous and nearly equal to the value of the cereal crop of the entire United States. This immense delta region, besides the grain lands in its northern portion, contains at least 10,000,000 acres of the best cotton lands in the world and 5,000,000 acres of the richest sugar and rice lands. These estimates of the delta of course do not include the alluvial lands of the tributaries of the Mississippi that are subject to overflow, which would greatly increase the area already mentioned. Should this region be thoroughly protected, it would soon produce for our country at least half the sugar it now consumes, and for which we pay annually to other countries \$45,000,000 in gold, besides the exports we send them would produce all the rice we consume, and would also give us a monopoly of cotton production for the world. All that is required for the amplest development of its vast resources is secure protection from disastrous floods, which carry ruin and desolation and death with them. The million and a half of planters and laborers there must be protected from their dreadful ravages, or forever retire before them.

The question now is, can this vast region be thoroughly protected? In the past, levees have been almost exclusively relied on. Cut-offs and outlets have been sometimes suggested, and have been ably advocated by writers of eminence and distinction, but have not received much favor, while thousands of miles of levees have been hopelessly and confidently constructed. They have sometimes failed to answer all the expectations of the builders, especially where unwisely located, but in the main have done immense good and accomplished great results. They have reclaimed millions of acres of the richest lands in the world and have increased their value immensely. In 1860 the farm lands and plantations of the great delta, which from Cairo to the Gulf is nearly 600 miles long and 30 to 120 wide, were computed to be worth, for agricultural purposes alone, without levees, about nine and a half million dollars, but with levees \$339,718,440. Levees had increased the agricultural value of the lands of the delta more than \$330,000,000, which of course does not include its numerous cities, towns, and villages, nor even the houses and other buildings on the plantations. It was the mere naked value of the soil for the plow and hoe.

In 1860 there were in this region over 2,000 miles of levees, with an average height of 8 to 10 feet and a breadth at the base of 50 to 75 feet, their width at the top being usually equal to their height. A few of the levees were of immense size. That of the Yazoo Pass, about 100 miles below Memphis, was cut by the Union forces during the war at a point where it was 38 feet high. For a distance of 1,200 feet it was on an average 28 feet high, and in places nearly or quite 300 feet broad at its base. This was and is the largest levee on the river.

The National Government has done nothing as yet for the protection of the delta from the floods except merely to make surveys and observations and to donate the swamp lands reclaimed to the States. Individual planters, towns, parishes, cities, counties, and States, the

direct sufferers, have thus far borne the heavy burdens of building the levees, and have expended immense sums on them.

Louisiana before the war had expended more than \$24,000,000, Mississippi more than \$14,000,000, Missouri over \$1,640,000, and Arkansas near \$1,000,000; in all about \$41,000,000.

Since the war Louisiana has spent about \$13,000,000 and Mississippi some \$7,000,000, making up to this time over \$60,000,000 expended since about 1830, or in the last fifty years, for levees. It is beyond the power of impoverished and desolated communities to continue this work. Since the overflow of 1874, or during the last eight years, the States of Louisiana and Mississippi have made every effort in their power. They have taxed the lands and the products of the soil both to the fullest extent they could bear, but the flood of this year, the most destructive ever known, has shown how futile are their efforts, and that only by the strong arm of the Government can this great work of importance to the whole nation be accomplished. To-day, when hundreds of thousands of our people there are destitute, their all excepting their lands swept away by the devouring flood, their cattle, their horses, and working animals drowned or starved, hunger and famine staring them in the face, their lives only saved by the rations sent them by a beneficent Government, the question arises with thrilling interest, what can be done to save and protect this vast region? What reliable and comprehensive plans can be sought out and adopted that will in future rescue it from floods and desolation?

This is a mighty problem that challenges the most earnest attention of the patriot and the statesman. It demands anxious and deliberate thought, profound study, and, after all that, vigorous action. It cannot be ignored. It cannot longer be evaded or trifled with. It must and will have some solution. The question is, shall the vast delta, with all its enormous gifts of nature, with all its magnificent capabilities, be for countless ages to come the home of man or of the alligator? Shall it be the happy abode of millions of our people in the far-coming future, or shall it be abandoned to malaria and miasma, to waste and solitude and gloom? Shall this immense region be a living fountain of wealth to our country, the glowing Eden of production on the vastest scale of the great staples of the world's commerce, its cotton, its sugar, and rice, or shall it lie wallowing in the ooze and floods for centuries, the eye-sore of the nation, the gloomy sepulcher of its honor and its statesmanship?

The difficulties to be overcome are confessedly great, but by no means insurmountable. I will briefly mention a few of them. The first is the immense amount of the water. Twenty trillion cubic feet of rain water fall on an average each year in the immense Valley of the Mississippi. This is equal to a lake 720 miles long, 100 wide, and 50 feet deep. Three-fourths of this immense quantity is absorbed by the earth, or disposed of by evaporation, &c., so that nineteen and a half trillions is the average amount carried to the Gulf by the great river. The quantity varies greatly, however. Sometimes, in a low-water year, it is only eleven trillions, while in one of very high floods it has risen to twenty-seven trillion cubic feet. The vast quantity of this "rushing inland sea" in itself constitutes a most formidable obstacle. Its discharge is larger than that of all the noted rivers of Europe combined, and is equaled by only two on the globe, being a little more than two-thirds that of the La Plata, and only something more than a quarter that of the Amazon.*

The enormous volume of water that comes rushing down the river with tremendous force in time of floods can never be realized by one who has not seen it.

The variability in the volume of water from season to season and from year to year is a great difficulty, for were the amount always the same it would be vastly easier to calculate for and provide the forces necessary to confine it within the bed of the river.

The winding course of the river and the soft and yielding nature of its banks constitute another great difficulty. If the Mississippi ran straight and could remain so (which with its soft and friable banks it could not do) there would never be any overflow. It would only have half as far to go as now, and would run at least twice or thrice as fast. So it could easily carry off five or six times as much water as it now does. From the mouth of the Missouri to the Gulf on a straight line is about 675 miles, with an average descent of about 8 inches to the mile, but the Mississippi winds and curves so much that it runs 1,300 miles in that distance, and thus reduces its average rate of descent to about 4 inches to the mile. Sometimes in running 25 miles round a bend it has not advanced forward a single mile. The traveler on a steamboat descending the river, and therefore of course going south, will often discover with surprise that for miles at a time he is going north. Half the time he

* The proportional quantity of water discharged by some of the principal rivers has been estimated as follows:

Thames	1	Indus	123
Rhine	13	Ganges	143
Loire	10	Yang-tse-Kiang	258
Po	6	Amoor	166
Elbe	8	Lena	125
Vistula	12	Obi	179
Danube	65	Nile	250
Dnieper	36	Saint Lawrence	112
Don	38	Mississippi	338
Volga	80	Plata	490
Euphrates	60	Amazon	1,280

is moving east or west. He becomes sadly bewildered, but tries to have faith that the river knows where it is going, and at least will not run up hill.

It is a strange peculiarity of the wonderful river that as it proceeds downward in its course toward the Gulf, instead of growing wider as you would expect, it actually becomes much narrower. From the mouth of the Ohio, 1,080 miles above the passes, which are only a few miles above the Gulf, to the mouth of the Arkansas, 670 miles above them, the average width in time of high water is 4,470 feet, the depth 87. From there to the mouth of Red River, 300 miles from the passes, the width is 4,080 feet, the depth 96. From Red River down to Bayou La Fourche, which is 170 miles above them, the width is 3,000 feet, the depth 113. From there to the passes, or for the last 170 miles that the river flows in a single channel, the width is 2,470 feet, and the depth 129. It will be observed that as the river becomes narrower it grows deeper as a compensation. The reduction of its width, however, from 4,470 to 2,470 feet is very striking. It has actually lost 2,000 feet in width. I may mention that the river loses at least one-tenth of its mean width as the season of low water sets in. At such times its mean width from the mouth of Red River to Bayou La Fourche is 2,750 feet, and from there to the passes only 2,250.

The rise and fall of the waters of the river, or the difference between the highest and lowest waters, is another and the greatest difficulty in controlling the Mississippi. At Cairo, and also at Natchez, 360 miles from the Gulf, it is 51 feet; at Memphis, 40; at mouth of Red River, 44; at Bayou La Fourche, 24; at New Orleans, nearly 15; at Fort Saint Philip, 4½; at the passes, where the river forks into several channels, only some 10 or 12 miles from the Gulf, it is about 2½ feet, and at the Gulf of course nothing.

The immense amount of mud and sediment suspended in the waters of the rivers, especially during the floods, is another difficulty. Able engineers have computed that it annually carries into the Gulf in suspension enough precious soil to form a solid mass 1 mile square and 241 feet high. Others think it carries far more. The best authorities estimate the weight of the sediment so carried at more than 406,000,000 tons. But besides this immense amount it deposits vast quantities on its banks and all over the country overflowed in time of floods. Rushing along at such times at the rate of 6 miles an hour, and in the middle of its current on the surface more than 7, its madly whirling waters are loaded with sediment. But as soon as the waters pour over its banks they begin to move much more slowly and drop a large portion of their solid matter at once on or near the banks, and thence in diminishing quantities for miles till they reach the swamps. In this way it comes to be a fact that the land, as you go back from the river, slopes downward for miles. The banks become in time much higher than the land farther back, the slope in the first mile being from 3 to 12 feet, and on an average fully 7. Hence the river runs, as it were, in the center of a vast ridge a few miles wide and as long as the river's course. In time of highest waters it rises as high as the top of this great ridge and higher, but the mass of its waters remains in its bed, which is from 100 to 150 feet deep.

But the undermining and constant caving in of its banks is the great and most serious trouble in regard to the Mississippi. Deep down below the 20 or 30 feet of surface soil deposited at some time by the river are vast beds of clay. Beneath them are immense layers of sand, often 60 or 80 or even 100 feet below the top of the banks. The two, however, are often strangely intermixed and interspersed the one with the other. The current of the river washes out the sand, and the banks, thus left without support, sooner or later give way and tumble into the waters, which speedily transport them elsewhere in the form of sediment, or oftener roll and push and whirl them along for a mile or two, or less, until they aid to form sand-bars or islands or new banks lower down. Niagara River works its way during the slow centuries in a somewhat similar manner up toward Lake Erie; only there it is an understratum of soft rock of shale instead of sand a hundred feet beneath the bed of the river, that by degrees is washed away and leaves the hard superincumbent rocks to fall by their own weight. Whenever the current is turned or deflected toward either bank, as often occurs, and always in concave bends, the bank assailed, if of soft and yielding material, as sand or loam, is washed away like a snow-bank before an April sun. Houses, farms, forests, and sometimes towns are swallowed up.

The village of Napoleon, Arkansas, so noted in former days, has thus been swept away. Waterproof, once a flourishing town, 400 miles up the river, has been entirely washed away since 1850, but has been again rebuilt nearly a mile further back, where it is again in danger. In its former location it only required a levee 3 or 4 feet high, because being then on the old bank it was on higher land than it now is. To-day it is in peril behind a levee 9 feet high. When the banks give way far enough back to reach the levees they fall in, of course, and the new levees have to be built much higher, (because on lower ground and farther back,) and wider in proportion, and costing vastly more. If, for instance, the new levee be built on land 10 feet lower than the former one was, it must be raised to a greater height by 10 feet, and will be at least 70 feet broader at its base; for the higher a levee rises the greater must be its foundation and its cross-section throughout.

The solid contents of levees are, in fact, in strict proportion to the squares of their height. Men have seen, in certain localities, in a single life-time, three or four levees thus built, one after another, each

succeeding one necessarily higher and broader and more costly than its predecessor. This process cannot go on always. Something better than such a system must be adopted. Some plan to prevent the caving of the banks becomes an absolute necessity. The injudicious location of levees has often exposed them to destruction. Planters living near the river insist on their being built in front of their improvements, to protect them at all events, and thus they are often placed too near the crumbling, caving banks. A great central power like the National Government is needed, with absolute authority to determine where the levees shall be located, and how they shall be built to make them secure and lasting.

But place them where you will, it will be found we can never rely on levees alone. Experience of over a hundred years has shown that the natural banks must be protected in order to prevent caving. In cases where the river has for ages perhaps cut away the bank on one side, making a bend of twenty or thirty miles, shaped like an enormous horseshoe, sometimes in a great flood it cuts across and makes a new channel, through which it tears its way and rushes down, a mad torrent, with fearful speed and violent turmoil. Such "cut-offs," as they are called, for a time lower the water above them, as it now has to run only a mile, perhaps, or less, where it used to run twenty-five. But they make an awful destruction of the banks on one side or the other, both below and above, and engulf whole plantations, until finally they create other and new bends. Even the clearing out of the channel of the river by removing snags and other obstructions may change the current and cause valuable plantations to be washed away.

As the river tears away the land on one side it builds up elsewhere. Plantations sometimes advance their fronts for miles, and towns that once were on the river's banks find it receding from them until they are left far inland high and dry. Providence and Saint Joseph are examples. They are now left far away from their own landings. Natchitoches was once on the banks of Red River. Now the stream is three or four miles away from it at the nearest point on the north, and eight or nine on the east. The same thing has happened to cities in the Old World. The Vistula, the Po, and the Rhine have deserted cities once located on their banks and the seats of a flourishing river commerce. Saint Louis was once threatened with such a disaster, but the vigilance and energy and public spirit of her citizens by proper action at great expense averted the imminent danger.

And of late years the historic city of Vicksburg is in danger of being left an inland town by the river cutting across the neck above, and near where General Grant's army tried to cut the canal during the war.

To prevent this danger Captain Eads recommends a restoration of the river to its old channel by extending Delta Point, thus throwing the channel over and against the Vicksburg shore.

Having spoken of the difficulties to be overcome, let us consider whether they are as great as they appear; whether they be as great or equal to works of a similar nature in the Old World, where, for hundreds of years, the governments of many of the countries there have been successfully carrying out works of this nature on their rivers and harbors. And, in comparing their works of river improvement and land reclamation with ours, let us consider how those nations and states compare in population, territory, and resources with this great nation of ours, with our population of over fifty millions, and our territory extending from ocean to ocean, from tropic to polar climate, and possessing natural resources of agricultural and mineral wealth greater than any other portion of the globe.

Each nation in Europe large enough to have any rivers has expended vastly more. France has spent hundreds of millions upon the Rhone, the Loire, the Garonne, and her other streams. The Adige and the Po, in Italy, have cost from ten to twenty times what the Mississippi requires. Those rivers have been diked and leveed for many centuries. The difficulties to be overcome in the Old World, where rivers come rushing down the lofty slopes of the Alps with the force and the fury of the avalanche, were in some respects far greater than those which the civil engineer has to encounter in the valley of the Mississippi. The average height of all the dikes on the Vistula is twenty feet; the highest are twenty-eight, but the average height is double that of the levees of the Mississippi. The embankments on the Rhine are far higher than any dreamed of in America. In Holland, Friesland, and Zealand, the dikes are from twenty-five to thirty-five feet high.

We may learn much in this connection from the example of a little state in Europe which in spite of nature has carved for itself a great name in history. Holland is a land lower than the sea, and reclaimed by the labor and skill and courage of man from the dominion of the waters. For many centuries its people have battled with their rivers, the Scheldt, the Rhine, the Maas, the Waal, the Lech, &c., and have fought back the sea. Countless levees, which have splendid well-paved roads on their tops, confine the waters of the rivers and the lakes. Enormous dikes keep out the sea. Innumerable canals furnish drainage and navigation. The finest pastures and meadows in Europe are the Dutch polders, so called, the bottoms of former lakes that were first leveed around and then pumped into the ocean. The great lake of Haarlem, ages ago, was thirteen miles long and six wide. But from time to time the sea broke in with its vast waves and raging storms, extending its bounds and devouring the land till Amsterdam and other cities were in danger. Then the spirit of the

Dutch was roused as that of our people should be to-day. They grappled with the floods, shut out the sea by mighty barriers, and then pumped the famous old historic lake dry. And where once famous naval battles were fought between the Spaniards and the Dutch centuries ago, you now behold green pastures, smiling fields, herds of cattle, and homes of men.

Amsterdam and a hundred other cities of Holland stand where once rolled the sea, and on lands that were mere marshes for ages afterward, until man thoroughly reclaimed and beautified them. Holland in the course of centuries has expended on her dikes and levees and in the reclamation of her soil £300,000,000, a sum, allowing for the difference in the value of money in former days and now, larger than our national debt. And all Holland, its highlands as well as its lowlands, the whole kingdom of the Netherlands, in fact, is not one-hundredth part as large as the valley of the Mississippi, and only one-third the size of its delta. It is the manly qualities of her people that constitute her greatness, not the extent of her territory. She has suffered floods far more terrible than any our country has ever known, but she has conquered them. One of them, four and a half centuries ago, drowned one hundred thousand persons in a single night, but still she was undismayed. Each hour she is at work driving back the sea, and every day she adds seven more acres to her lands year after year. If little Holland, a mere speck on the world's map, a land poor and desolate by nature, without a bed of coal, without a quarry of stone, without a single mine, without forests, without the rich staples of the commerce of the world on her own soil, could achieve results so gigantic and so stupendous, the American must have but the soul of a mouse who cries out that our country, with its vast extent of most valuable territory, with its rich mines in every mineral and richer soil, reaching from ocean to ocean and grasping the unlimited wealth of half a continent, with all its grand and magnificent resources, cannot do the little that is needed for the drowning delta of the Mississippi. Have we sunk so low as that?

Mr. Speaker, during my early service in Congress the right of Congress to reclaim and protect these lands under the provisions of the Constitution was questioned, and still occasionally a faint suggestion is ventured that the action proposed is unconstitutional; but surely the objection cannot be made in earnest. Floods in the great delta not only desolate that portion of our land, paralyzing its industries, blighting all its prospects, and utterly ruining its people, but they inflict vast injuries upon the whole country. Every section and every State feels the shock. The farmers of the West lose by it a valuable customer for their crops. Every man in the nation will pay more for his sugar and his cotton in consequence. The floods for a long period break up the railroads and the post-routes over a vast and valuable region of our country, and make it worse than a wilderness. Post-offices fail to receive their mails for weeks. Communication by land ceases. No railroad there can ever be a success so long as its bridges and its track can be washed away by every flood. The Post-Office Department of the nation is drowned out in that region by every great overflow, and yet gentlemen tell us that it is unconstitutional for the Government to stay the floods and save its own mails, its own post-offices and post-roads.

This question of the constitutionality of this great work deserves, in my opinion, no further notice. If Congress has the right to order surveys of the river, to place lights and buoys to guide the commerce on its waters, it also has the right to build levees or embankments to confine the waters to the channel, and thereby deepen the channel for purposes of navigation.

But, Mr. Speaker, another view of this question. Of what, let me ask, does the commerce of this great river consist? Surely not simply of the products raised on its immediate banks and shipped on its waters; nor does it consist of the products of the great States on its borders alone; nor even of the great Northwest seeking the sea. This great river has been likened to and called "an inland sea," and the name is well chosen. It may be said to divide our great country in two halves, extending from the Gulf to our utmost northern border. And its banks are the shores of that sea on and from which are received and shipped not only the products of the immediate border but with our great system of transcontinental railroads, to these banks of the mighty river, "the inland sea," are brought the products of other and remote States, even from California on the Pacific, whence comes its wheat, and from Pennsylvania and Massachusetts on the Atlantic, whence comes their manufactured goods and products of iron, all being brought by our system of railroads there to its banks to be shipped up or down its mighty current to supply our own and foreign lands.

This, then, constitutes the commerce of the river; and if Congress has the right to protect and improve the harbors and shores of our Atlantic, Pacific, and Gulf coasts, it surely has the same right to improve the shores of this other great sea situated in the heart of the continent and having a commerce, counting that of the railroads tributary to its waters, many times more than all of our foreign commerce. But how is it with this tributary commerce of railroads in times of overflows and floods? For weeks and months at a time it is absolutely suspended, and the roads themselves are under water, their embankments, bridges, and tracks injured and washed away, and the commerce of the whole country, from ocean to ocean, to and across the river, is obstructed and suspended. During the flood of this

year not a railroad approaching or crossing the river from either side but that was compelled to stop the running of trains and the carrying of freight, passengers, and the Government mails for weeks, and some of them for months. Trains, Mr. Speaker, bearing the wheat and precious products of distant California, bringing their burdens to New Orleans to be there shipped abroad through the jetties, after coming thousands of miles, were compelled to stop eighty miles from their destination because there were the waters of the great "inland sea." Trains, too, bearing the rich burdens of manufactured goods and railroad materials for Texas and Mexico, and coming from distant States on the Atlantic were there stayed for months, because they could not cross this mighty sea spread out over lands, railroad tracks, and all to a width of from thirty to eighty miles.

Will any one, when these immense interests involving the commerce of the whole country are at stake, doubt the right of Congress under the Constitution, or their duty to their constituents, to at once apply the remedy—their right and duty to at once not only protect the people of the delta from destructive floods but protect the commerce of distant States from this almost annual obstruction and suspension for months at a time?

And now, Mr. Speaker, I come to speak of the Mississippi River commission, their plans and methods for performing the great work intrusted to their care. And on this I can well be brief, because no member of this House but has without doubt given sufficient attention to the subject to be well informed as to these plans and methods.

This commission was created by act of Congress in 1879, and the law creating the commission specified what their duties should be, as follows:

SEC. 3. It shall be the duty of said commission to direct and complete such surveys of said river, between the head of the passes near its mouth to its headwaters, as may now be in progress, and to make such additional surveys, examinations, and investigations, topographical, hydrographical, and hydrometrical, of said river and its tributaries, as may be deemed necessary by said commission to carry out the objects of this act.

SEC. 4. It shall be the duty of said commission to take into consideration and mature such plan or plans and estimates as will correct, permanently locate, and deepen the channel and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof; prevent destructive floods; promote and facilitate commerce, trade, and the postal service; and when so prepared and matured, to submit to the Secretary of War a full and detailed report of their proceedings and actions, and of such plans, with estimates of the cost thereof, for the purpose aforesaid, to be by him transmitted to Congress: *Provided*, That the commission shall report in full upon the practicability, feasibility, and probable cost of the various plans known as the jetty system, the levee system, and the outlet system, as well as upon such others as they deem necessary.

In pursuance of the requirements of this act, the commission began and have carried on their work. They made a full and complete report to the last Congress of their work so far as then completed; but from that Congress received only the sum of \$1,000,000 for work last year, and this amount was hampered with a proviso that no part of it should be used for the purpose of closing the gaps in or building levees. The early rise of the river last fall prevented any work of channel contraction, and so about all that has been accomplished has been to get ready for active work this year by securing an extensive plant of boats and other appliances. The general plan of the commission can be stated to be one which will confine the river to its proper channel, and thus secure its full scouring and sediment-carrying capacity. And in this manner the channel will be deepened and destructive floods prevented. As I said, not only the reports of the commission in print have been examined but the individual members have been called on to explain their plans and methods before both the committee of improvement of the river and the Committee on Commerce, who report this bill; and from this evidence and their reports I beg to quote, as it will show better than any explanation I am able to give what these experienced and able engineers propose to do. I quote first from page 17 of the printed report:

The bad navigation of the river is produced by the caving and erosion of its banks, and the excessive widths and the bars and shoals resulting directly therefrom.

Uniform depth joined to uniform width, that is to say, uniformity of effective cross-section, implies uniform velocity, and this means that there will be no violent eddies and cross-currents and no great and sudden fluctuations in the silt-transferring power of the current. There will, therefore, be less erosion from oblique currents and eddies, and no formation of shoals and bars produced by silt taken up from one part of the channel and dropped in another. As the friction of the bed retards the flow of the water, any diminution of the friction will promote the discharge of floods. The frictional surface is greater in proportion to volume of discharge where the river is wide and shoal than where it is narrow and deep. It follows, therefore, that after the wide shoal places are suitably narrowed, and the normal sectional area is restored by deepening the channel the friction will be less than it was before. This will result in a more easy and rapid discharge of the flowing water, and consequently in a lowering of the flood-surface. It would seem, therefore, that the plan of improvement must comprise as its essential features the contraction of the water-way of the river to a comparatively uniform width, and the protection of caving banks, and this is presumed to be the plan referred to in the act as the "jetty system." It is known from observation of the river below Cairo, not only that shoals and bars, producing insufficient depth and bad navigation, are always accompanied by a low-water width exceeding 3,000 feet, but that wherever the river does not exceed that width there is a good channel. In other words, bad navigation invariably accompanies a wide low-river water-way, and good navigation a narrow one.

The work to be done, therefore, is to scour out and maintain a channel through the shoals and bars existing in those portions of the river where the width is excessive, and to build up new banks and develop new shore-lines, so as to establish as far as practicable the requisite conditions of uniform velocity for all stages of the river.

It is believed that this improvement can be accomplished below Cairo by contracting the low-water channel-way to an approximately uniform width of about three thousand feet, for the purpose of scouring out a channel through the shoals and bars, and by causing, through the action of appropriate works constructed at suitable localities, the deposition of sand and other earthy materials transported by the water upon the dry bars and other portions of the present bed not embraced within the limits of the proposed low-water channel. The ultimate effect sought to be produced by such deposits is a comparative uniformity in the width of the high-water channel of the river.

It is believed that the works estimated for in this report will create and establish a depth of at least ten feet at extreme low stages of the river over all the bars below Cairo, where they are located.

It is the opinion of this commission that, as a general rule, the channel should be fixed and maintained in its present location, and that no attempt should be made to straighten the river or to shorten it by cut-offs.

Experience, as well in this country as in Europe, justifies the belief that the requisite correction and equalization of the transverse profile of the stream, by developing new shore-lines and building up new banks, may be made chiefly through the instrumentalities of light, flexible, and comparatively inexpensive constructions of poles and brush, and materials of like character. These constructions will commonly be open or permeable to such a degree that, without too violently arresting the flow of water, thereby unduly increasing the head and causing dangerous underscour, they will sufficiently check the current to induce a deposit of silt in selected localities.

The works which have been used in similar improvements are of various forms and devices, such as the hurdle, composed of a line of stakes or light piles, with brush interlaced; the open dike, formed of stakes with waling strips on both sides filled in loosely with brush; the continuous brush mattress, built or woven on fixed or floating ways and launched as fast as completed, as a revetment to a caving bank, the mattress used as a vertical or inclined curtain, placed in the stream to check the current, the same laid flat on the bottom as the foundation for such a curtain or as an anchorage for other brush devices; curtains of wire or brush netting, placed vertically or inclined in the stream; and various other forms of permeable brush dikes, jetties, or revetments. Some of these methods of construction have been used on the Mississippi and Missouri Rivers with increasing satisfaction and success, although they cannot yet be regarded as entirely beyond the experimental stage. In some, perhaps in many, localities, works of much more solid character than those above indicated may be necessary.

The closure of deep channels or low-water chutes, with a view of confining the flow to a single passage, may require substantial dams of brush and riprap stone or gravel, but it is believed the lighter and less costly works will generally suffice.

By a permeable dike located upon the new shore-line to be developed, connected with the old bank at suitable intervals by cross-lines of like character, or by jetties or hurdles or other permeable works projecting from the bank with their channel ends terminating on the margin of the proposed water-way, or by any other equivalent works, the area to be reclaimed and raised will be converted into a series of silting basins, from which the water, flowing through the barriers with diminished velocity, will, after depositing its heavier material, pass off and give place to a new supply. In this manner the accretion will go on continuously through the high-water season, or through two or more seasons if necessary, the works being renewed on the higher level as occasion requires.

Wherever necessary, the new bank must be protected by a mattress, revetment, or some equivalent device.

That these methods of improvement are practicable is shown by the works already executed on the Mississippi and Missouri Rivers.

The commission, as I have shown, by the organic act creating them were directed to thoroughly examine and report on the levee and outlet systems; and while there was some doubt and dissenting opinions originally on the part of one or two members as to the necessity of a levee system for purposes of navigation and commerce, as well as preventing destructive floods, the commission now all agree, and I quote from their first report:

The work to be done, therefore, is to scour out and maintain a channel through the shoals and bars existing in those portions of the river where the width is excessive, and to build up new banks and develop new shore-lines, so as to establish as far as practicable the requisite conditions of uniform velocity for all stages of the river.

It is obvious that levees are, upon a large portion of the river, essential to prevent destruction to life and property by overflow. They give safety and ease to navigation and promote and facilitate commerce and trade by establishing banks or landing places above the reach of floods, upon which produce can be placed while awaiting shipment, and where steamboats and other river craft can land in times of high water.

In a restricted sense, as auxiliary to a plan of channel improvement only, the construction and maintenance of a levee system is not demanded. But in a larger sense, as embracing not only beneficial effects upon the channel but as a protection against destructive floods, a levee system is essential; and such system also promotes and facilitates commerce, trade, and the postal service.

A levee system aids and facilitates the postal service by protecting from injury and destruction by freshets and floods the various common roads and railways upon which that service is conducted to and from the river bank, and generally within that portion of the alluvial region subject to overflow. Moreover, the permanent maintenance below Cairo of a connected levee system, a system of sufficient strength to inspire confidence in its efficiency, or the demonstration, by the achieved results of an improved river, that overflow need no longer be seriously apprehended, would act as a prompt and powerful stimulant in rapidly developing a largely increased trade and commerce in all the products of agricultural industry indigenous to that region, and in those branches of manufacturing enterprise related thereto.

The outlet system, after an examination, is condemned, as follows:

As the system of improvement proposed by the commission is based upon a conservation of the flood-waters of the river, and their concentration into one channel of an approximately uniform width, it would seem scarcely necessary further to consider a system based upon theories and arguments so diametrically opposed to it as the outlet system is thus shown to be.

And from the last report of the commission the following is a part of the report of a sub-committee on levees and outlets, consisting of Messrs. Suter and Harrod:

We beg leave to submit the following conclusions:

1. That bayous and overflows afford no permanent or uniform relief, but produce changes of regimen detrimental to navigation, and cause destructive floods.
2. That the direct influence of a levee system is to improve navigation and prevent destructive floods by the establishment of a regimen, and the elimination of varying and abnormal local conditions.
3. That the conservation of flood-waters by artificial embankments is becoming of greater importance every year, both in preserving navigation and in prevent-

ing destructive floods from the recession of the banks to lower levels, and has already, in many parts of the river, become essential.

4. That the act under which we serve contemplates the preparation by this commission of a complete plan for the regulation of the river and its banks. Any such plan must include the control and uniform maintenance of such conditions of the river banks as are consistent with the principles controlling the works already recommended by us. The present provision for such maintenance, by the States and riparian owners, is inadequate and hazardous.

In the evidence given before the committee Major Harrod stated as follows:

Mr. HARROD. The conclusion, I believe, from the observations made in Europe covering the last two hundred years, is that the progress of clearing and occupying the adjoining country does deteriorate rivers in perhaps three ways: by making floods more rapid and excessive and disturbing; by decreasing the low-water discharge; and by filling up the river bed, owing to the greater quantity of sand and gravel carried down.

Mr. JONES. And the only way such influences can be counteracted on the Mississippi, in your judgment, is by building levees—the only salvation for that country is to hold the water between banks and force it to scour a way for itself down to the ocean?

Mr. HARROD. Yes, sir; that is my opinion.

Mr. KING. You were at one time chief of engineers of the Louisiana State board of engineers on levees?

Mr. HARROD. Yes, sir; for some years.

Mr. KING. In the course of your study of the general subject of levees, have you observed any necessity for levees as a means of giving safety and ease to navigation during seasons of flood?

Mr. HARROD. Yes, sir; that subject has been presented to us. Levees do give such ease and safety, but probably the extremest cases are presented by this recent flood. I am informed that almost all the light-houses upon the river are swept away. I am also informed that the Memphis Anchor Line of boats (a very large line, as some of you gentlemen know) were withdrawn from the trade two or three weeks ago, because they could not make their landings, and the majority of the railroads that extend from the river westward are under water. There are one or two, I think, in the Saint Francis bottom. The road from Arkansas City west is under water and stopped running some time ago; the road from Vicksburg west is about four feet under water. The Baton Rouge road, a local road, has ceased running, and I have very little doubt from the news in the papers this morning of the breaking of the La Fourche and Point Coupé crevasses that Morgan's Louisiana and Texas Road, which is a Pacific road, will go under water.

Captain Eads stated before the committee:

I believe that this will be the result of the works of improvement projected by the Mississippi commission; that a beneficial condition of affairs for navigation and for agriculture will result so much quicker to the country if we close these gaps in the levees and get all of the force of the river to help this good work. I do not think that \$2,000,000 can be better employed than in having these gaps closed. That work can be done without any interference whatever with the work of the commission. If Congress will authorize the closure of them by the Secretary of War he can have the work contracted for, and it can go on without interrupting at all any of those works of improvement which the commission have recommended, and it will bring the deep channel so much the quicker.

Lieutenant-Colonel Comstock, of the commission, answered as follows:

Mr. JONES. Therefore the only permanent relief, you think, is to be obtained by confining the waters, and so cutting a channel down to the sea which will afford a sufficient outlet for the water? All other reliefs would be temporary, and would be like doctoring the symptoms instead of attacking the disease, wouldn't they? Lieutenant-Colonel Comstock. If you are speaking of overflows, I think the only permanent relief is to make big levees.

Mr. JONES. So as to confine the water and compel it to cut itself a channel out to the ocean instead of spreading over the country?

Lieutenant-Colonel COMSTOCK. Yes.

Mr. MOORE. In connection with your jetty or levee plan would or would not two or three outlets wisely located to take off the surplus water tend to improve the navigation?

Lieutenant-Colonel COMSTOCK. No, sir; I do not think you can ever improve the navigation in that way.

Professor Mitchell, of the commission, said:

"I am just fresh from a little study of the Delaware, which is a minute stream compared with the Mississippi, but which has all the characteristics of the larger river. Some portions of the Delaware have been leveed for a hundred years, and, as far as I can observe, the response of the river to the process proposed by the Mississippi River commission has been prompt and satisfactory, and excellent results have come from a systematic procedure upon substantially the principles and the method proposed by the commission. The stream has been leveed, then it has had its shores occupied by wharves and other structures, and the bottom has given away just about so fast. The Delaware is a stream which is subject to floods. I have not the figures to show the size or extent of those floods, but, so far as I know, they have not increased. The bottom has given away about as rapidly as the shores have been raised, so that the stream is in as good condition now as it ever was in respect to floods, and in a great deal better condition as to navigation, having twelve or fifteen feet more water."

Mr. DARRALL. What kind of material has been used in the construction of the levees on the Delaware?

Mr. MITCHELL. Substantially the same as on the Mississippi—heaps of sand or earth.

Mr. DARRALL. Can you give us any information as to their size or height?

Mr. MITCHELL. I cannot give you anything definite. They appear to be about the same height as those along the Mississippi—4 or 5 feet high.

And General Gilmore, the president of the commission, made the following statement before the Committee on Commerce:

The volume of flow, and therefore the velocity and the scouring power in the bed of the stream, are all increased by levees during periods of overflow. Moreover levees are, upon a very large portion of the Mississippi River, absolutely necessary to prevent widespread destruction to life and property by overflow, and any one who has witnessed the sublime spectacle of such a flood as now prevails throughout the entire valley of the Mississippi, submerging the banks to a depth of many feet and spreading out over the entire alluvial section to widths varying from forty to sixty miles, cannot avoid the conclusion that an adequate system of carefully maintained levees is required to make navigation reasonably safe and easy and to render the carrying on of trade, commerce, and the postal service possible, in the sense of ordinary economic feasibility. I believe the fallacy that levees will cause a permanent raising of the flood surface has been abandoned by all who formerly entertained it.

Mr. GIBSON. Are the parts of your plan, namely, the improvement of the reaches and the re-establishment of the banks by levees, so closely connected as to be inde-

pendent, the one operating in low water, the other operating in high water, and both contributing to channel improvement?

General GILLMORE. Certainly.

Mr. GIBSON. Both essential, therefore, to the general scheme which you have explained to the committee?

General GILLMORE. Exactly; but in my judgment levees built specially for channel improvement might be better located than they generally are. You cut across necks and points of land in building a levee to prevent overflow, whereas if you were building it merely for the purpose of improving the channel you would follow the bends. But even as they are located, the levees are an essential part of the system of improvement that we have projected.

And finally, I quote from the supplemental or minority report made by Captain Eads recently; and while not detracting from the great learning and engineering skill of other members of the commission, it must be said that in experience with this great problem of the improvement of the Mississippi he has the advantage of any of them:

My views regarding the important agency of the levees in improving the low water channel of the Mississippi were not expressed in that report with the degree of emphasis which I then desired, and I am unwilling to commit myself now to any expression in the present report which, in the slightest degree, tends to throw a doubt upon the necessity of, or to justify any further delay in the closing of these outlets. On the contrary, I deem it proper to urge with redoubled force the absolute necessity of their immediate closure.

From quotations hereinafter made from the previous report of the commission, it will be seen that it relies upon the increased volume of discharge for scouring more deeply the bed of the river and lowering its floods. The loss of its volume through outlets or crevasses is fully recognized in that report, as the cause of the deposition of sedimentary matters in the bed of the river, by which its flood surface is raised from year to year.

Observations made by the commission plainly show that the effect of the present gaps in the levees has been to raise the flood-line of the river many inches above any heights previously attained within the seven hundred miles in which they exist most numerous, between Natchez and the mouth of the Ohio River. Within this distance there have occurred during the last eighteen years innumerable crevasses, aggregating, in 1875, a length of about one hundred miles, and throughout this part of the river the deposits have raised its bed so much as to greatly injure navigation, and to cause smaller floods to rise to heights never before attained.

This question is of such vast importance, and in view of my dissenting from the report of the commission, I trust that I will be pardoned for explaining at some length the general principles underlying the plan of improvement recommended by the commission, and the relation which the levees have to that plan. It should be borne in mind that this plan is only applicable to the rectification of a sediment-bearing river, and not to rivers flowing through rocky beds, and whose waters are clear. It should be especially noted, also, that this plan, when fully executed, will render the further use of levees almost, if not entirely, unnecessary.

I think these extracts are sufficient to show in what manner and by what methods the commission propose to do their work, and that nothing further need be said than to repeat that these plans and methods have been indorsed by the two committees of this House who have examined them with the greatest possible care, and I trust the House will further indorse them by passing this bill.

Before closing on this branch of the subject let me state what the commission expect to accomplish for the river's improvement, and what they estimate it will cost, so that we may each of us judge whether the outlay is commensurate with the objects to be attained. The commission expect on the completion of their work to have a low-water channel clear of sand-bars and obstructions all the way from Cairo to the mouth of the river, and to have the millions of acres of fertile lands of the great delta absolutely safe from all destructive floods. And this at a total cost of not over \$37,000,000; \$4,000,000 for levees and \$33,000,000 for improvement of the channel and protection of the banks from caving. Will any one say that this paltry sum is too much for such a work? The loss by the flood of this year, direct and indirect, is very nearly double this sum. And the yearly loss to the commerce of the river during low water is surely at least half what is expected to be expended annually in this work. The cost, Mr. Speaker, does not compare with the results to be obtained, and I feel safe to say that no great work of public improvement ever attempted or completed in the history of the world promises results as grand as this. Let this appropriation be made and the good work once be inaugurated, and I venture to say no one will ever say stop till it is completed.

The Republican party, now in power in all branches of the Government, is committed to this great work. In a Republican Congress, the Forty-second, an appropriation for rebuilding the levees of \$3,000,000 was passed by the House, and only failed by one vote in the Senate. Each of our three last Presidents, Grant, Hayes, and Garfield, in messages or speeches favored this improvement. And on the 17th of April of this year, when the last great flood was at its height, when the suffering, starving people of the great valley were cowering in terror before their dreadful enemy, the water, the present Republican Chief Executive sent to each House of Congress a message on this subject, which I append to my remarks, and which needs no comment from me. May I hope that Congress will come up to the same high stand on this subject that marks the wisdom and statesmanship of President Arthur?

The Republican party, in the twenty years and more they have been in power, have made a record in the history of our country of which the patriot may well be proud. They have saved the life of the nation from assaults within. They have saved her honor and her credit from assaults without before the whole world. They have connected the shores of our two great oceans and the thousands of miles between by the grandest system of transcontinental railroads on the globe. They have given to our manufacturing, agricultural, and mining interests such protection as has made our country the

greatest workshop of the world, and our laborers the best paid. They have improved the navigation of our rivers and streams. They have built costly works to improve our harbors and protect our shipping. And they have opened the mouth of the great Mississippi, obstructed for centuries, free to the commerce of the world. But greater and grander than all these achievements, save alone that of fighting out the war of the rebellion, will be this work of redeeming and protecting the great delta of the Mississippi.

APPENDIX.

PRESIDENT ARTHUR'S MESSAGE ON THE PROTECTION OF THE VALLEY.

To the Senate and House of Representatives:

I transmit herewith a letter dated the 29th ultimo, from the Secretary of War, inclosing copy of a communication from the Mississippi River commission, in which the commission recommends that an appropriation may be made of \$1,010,000 for "closing existing gaps in levees," in addition to the like sum for which an estimate has already been submitted.

The subject is one of such importance that I deem it proper to recommend early and favorable consideration of the recommendation of the commission. Having possession of and jurisdiction over the river, Congress, with a view of improving its navigation and protecting the people of the valley from floods, has for years caused surveys of the river to be made for the purpose of acquiring knowledge of the laws that control it, and of its phenomena. By act approved June 28, 1879, the Mississippi River commission was created, composed of able engineers. Section 4 of the act provides that "it shall be the duty of said commission to take into consideration and mature such plan or plans and estimates as will correct, permanently locate, and deepen the channel and protect the banks of the Mississippi River, improve and give safety and ease to the navigation thereof, prevent destructive floods, promote and facilitate commerce, trade, and the postal service."

The constitutionality of a law making appropriations in aid of these objects cannot be questioned. While the report of the commission submitted and the plans proposed for the river's improvement seem justified as well on scientific principles as by experience and the approval of the people most interested, I desire to leave it to the judgment of Congress to decide upon the best plan for the permanent and complete improvement of the navigation of the river and for the protection of the valley.

The immense losses and the widespread suffering of the people dwelling near the river induce me to urge upon Congress the propriety of not only making an appropriation to close the gaps in the levees occasioned by the recent floods, as recommended by the commission, but that Congress should inaugurate measures for the permanent improvement of the navigation of the river and security of the valley. It may be that such a system of improvement would as it progressed require the appropriation of twenty or thirty millions of dollars. Even such an expenditure, extending as it must over several years, cannot be regarded as extravagant in view of the immense interests involved. The safe and convenient navigation of the Mississippi is a matter of concern to all sections of the country, but to the Northwest, with its immense harvests needing cheap transportation to the sea, and to the inhabitants of the river valley whose lives and property depend upon the proper construction of the safeguards which protect them from the floods, it is of vital importance that a well-matured and comprehensive plan for improvement should be put into operation with as little delay as possible. The cotton product of the region subject to the devastating floods is a source of wealth to the nation and of great importance in keeping the balances of trade in our favor.

It may not be inopportune to mention that this Government has imposed and collected some seventy millions of dollars by a tax on cotton, in the production of which the population of the Lower Mississippi is largely engaged, and it does not seem inequitable to return a portion of this tax to those who contributed it, particularly as such an action will also result in an important gain to the country at large, and especially so to the great and rich States of the Northwest and the Mississippi Valley.

CHESTER A. ARTHUR.

EXECUTIVE MANSION, April 17, 1882.

London Fishery Exhibition of 1883.

SPEECH

OF

HON. PETER V. DEUSTER,

OF WISCONSIN,

IN THE HOUSE OF REPRESENTATIVES,

Monday, June 19, 1882,

On the joint resolution (H. R. No. 237) concerning an international fishery exhibition to be held at London in May, 1883.

Mr. DEUSTER said:

Mr. SPEAKER: The joint resolution recommended by the Committee on Foreign Affairs deserves the hearty support of every member of this House. It provides the means of keeping before the eyes of the world, through the coming grand international exhibition at London, our wonderful successes in enriching our extensive rivers and waters with inexhaustible supplies of the poor man's food and the rich man's luxury, fish. The propagation of fish has by this time well become understood as a source of national wealth, and we have the satisfaction of seeing our efforts in that direction more than amply repaid; while, on the other hand, the destruction of some of the finny tribes peculiarly American would, but for these efforts, have been unavoidable, and a direct loss to the large part of our population dependent upon fish for sustenance and industrial employment.

We have already won great triumph upon this new and profitable field of contest for supremacy. In 1875 Congress made an appropriation for expenditure by the Smithsonian Institution and the United States Fish Commission of over \$100,000 for the preparation of an exhibit of the animal and mineral resources of the United States at the

centennial exhibition at Philadelphia in 1876. Of this sum about \$30,000 was expended in connection with the fisheries branch of the subject. The display made in consequence was complete and satisfactory.

At the close of the exhibition these specimens were boxed up and transferred to Washington, where they remained stored in the Armory Building until 1880. In that year Congress passed an act for participation by the United States in the fisheries display at Berlin, and appropriated \$20,000 for the purpose. This amount would have been entirely inadequate but for the fact that the greater part of the display was already prepared, leaving comparatively little additional matter to be procured.

There were also in readiness a series of portable cases which had been constructed at an additional cost of some \$6,000, and which were forwarded to Germany with the exhibits, and used in the installation and display of the collection. Owing to the great liberality of the Bremen Steamship Company, the collection of boxes, occupying some twelve thousand cubic feet of capacity, was taken to Bremen and brought back again free of charge. The railroad companies between Washington, New York, and Boston acted in a similarly liberal spirit.

It will be impossible to use any considerable portion of the articles exhibited at Philadelphia and Berlin for the London display. Many of them were ruined by the transfer so as to require renovation, and the collection generally has become so well known by its double exhibition as to be what may be called shop-worn. For this reason an entirely new series of presentations will be required; also the fisheries industries have been greatly extended since 1880. The packing-boxes in which the collections were sent to Berlin and back have been destroyed; and the same may be said of the greater part of the cases. The expenditures therefore necessary will be as follows:

1. The preparation of the new exhibit in all its details, and of the most perfect character.
2. The preparation of the specimens, and mounting them on suitable boards or tablets.
3. The construction of cases in which they may be exhibited on reaching London.
4. The construction of packing-boxes necessary for holding the exhibit.
5. The freight charges to London and back on not less than twenty thousand cubic feet of packages.
6. The salaries, traveling expenses, and subsistence in London of the party necessary to take charge of the display.

The following schedule of expenditures is given as an approximate estimate:

1. The collection of the materials for the exhibit, \$8,000.
2. The general preparation for exhibition, \$5,000.
3. The construction of cases for exhibition, \$8,000.
4. The construction of packing-boxes for an estimated bulk of 20,000 cubic feet, \$3,000.
5. The freights on 20,000 cubic feet from Washington to London and back, \$20,000.
6. Expenses of party in charge of display, \$6,000.

A total of \$50,000, allowing nothing for incidentals, nothing for unexpected expenses, and nothing for acquiring articles of economical value to the United States by the National Museum.

The sum mentioned is the very lowest with which the work can be done to any advantage. It will indeed require a great deal of economy to bring a suitable outlay within the figure mentioned.

The Berlin fishery exhibition, besides calling the attention of foreign countries to the cheapness and excellence of the various fishery products of the United States, had a very marked effect in impressing the people of Germany, and indeed those of Western Europe, with the general wealth and abundant resources of this country. The display made by our Government—though on account of the late passage of the appropriation bill it was necessarily prepared in less than a month's notice, and, consequently, much less complete and impressive than it would have been under circumstances ordinarily favorable—was by far the most imposing of any in the whole exhibition.

The exhibition itself was in Germany considered to be of much greater importance than we are likely to realize, and attracted almost as much attention as did the exhibition of 1876 in this country. Week after week excursion trains from all parts of Germany brought throngs of that class of people which furnish the best element for emigrants. One hundred thousand visitors in a day were not an unusual number. An examination of the statistics of the emigration from Germany for 1880 indicates a remarkable increase in the number of emigrants during the months following the date of the opening of the Berlin exhibition.

The London Times, commenting on the exhibition at the time of its opening, asked the question, "How can the German Government dare to allow such an imposing display of the resources of the United States?"

The high tariff on foreign food-products collected by the German Government has prevented our fish merchants from succeeding as well as might have been expected in the introduction of their wares into this country. By reason of this tariff, food substances which otherwise might be sold in Germany at a price very far below that of the cheapest of their home productions of a similar nature have their prices increased about threefold.

Notwithstanding this fact, we are informed that American boneless codfish has been adopted as a standard article of food by some seventeen or more of the regiments of the German army; while its introduction into the commissary departments of the navies of Germany and Russia is seriously contemplated. As a direct result of the exhibition, agencies have been established for the sale of American fish products in nearly every country in Europe, and if our fishery capitalists fail to make use of the markets now open to them it is solely because the home demand for their products is so great that they are unable at present to meet any call from abroad.

The total value of the products of the fisheries of the United States in the census year was about \$45,000,000—the value being estimated at the price paid to the producer, and at wholesale rates the value of the same product is not less than \$90,000,000. The annual export of fishery products in the same year, 1880, amounted to \$5,744,580. This marked disproportion between production and exportation is due partly to two causes. In the first place the local demand for the products of the fisheries is very extensive, and to supply it occupies a very large share of the attention of our fishery capitalists. The resources of the waters of the United States, especially since the evil effects of overfishing have been neutralized by the results of fish culture, (as perfected by the United States Fish Commission,) are sufficient to allow the production of a quantity of useful products at least ten times as great as that now actually obtained.

Many millions of pounds of our most valuable fishes are allowed to waste every year because there is no suitable market for them, or rather because our fishermen have not yet learned how to utilize them by sending them to foreign countries. In our fishing towns unlimited quantities of fine fish can be bought for less than two cents per pound, and many choice varieties may be bought, salted and dried, for the same price or less. Our fishermen, who spend their lives at sea in the laborious and dangerous pursuit of the off-shore fisheries, often realize but one or two hundred dollars at the end of the year as a result of their labors.

It is doubtless possible to increase extensively the quantity of fishery products exported from the United States to Europe. The immense demand for cheap food in the thickly-settled countries of the Old World is only partly met and chiefly from other sources of supply. Norway and Sweden export annually into Germany a fishery product to the value of \$3,000,000, and into Europe generally at least nine or ten millions of dollars. The Dominion of Canada also sends fish to many countries where the United States has no market whatever.

Much more satisfactory results, from a commercial stand-point, may be expected from a participation in the fishery exhibition at London than could have been anticipated from that in Berlin, for our exports into Germany have rarely amounted to more than four or five thousand dollars a year, while in 1880 there was sent to England a fishery product of \$2,601,017.

The following statistics of the exportation of oysters to England will serve to show to what extent this market is capable of development. The value of this business was—

In 1875.....	\$38,661
In 1876.....	99,012
In 1877.....	118,634
In 1878.....	252,999
In 1879.....	304,473
In 1880.....	363,790
In 1881.....	403,629

The demand in Europe for American dried and smoked fish is practically none. The United States excel all other countries in the preparation of the cheapest and best qualities of dried cod and pollock, with skins and bones removed, and packed in neat boxes for transportation; and yet this process has never been introduced into the Old World. We have also an almost unlimited production of fine grades of smoked herring, sturgeon, halibut, and mullet, all of which would be sure to meet with favor if properly placed upon foreign markets.

There is likewise no foreign demand for American pickled fish, although the consumption of fish prepared in this manner in Europe is known to be immense, and at the same time the production of pickled fish in the United States was greater last year than ever before, 117,500,000 pounds of mackerel having been salted down as one of the products of the New England mackerel fishery.

It is, however, in the preparation of canned fish that our country particularly excels, and the demand for the various daintily manipulated and ingeniously packed articles of this class could without doubt be much increased, especially in France, England, and Italy. To this class belong the various kinds of cooked and canned fish, such as salmon, lobsters, clams, oysters, crabs, shrimps, codfish balls, and the numerous grades of pickled and spiced fishes, American sardines and caviars.

As has been stated, France, Germany, and England consume an immense and constantly increasing quantity of these articles, while there is an almost untouched field in other countries of Europe, as well as in its Eastern dependencies, to whose climates these preparations are especially well adapted. In 1868 there was no export of this class recorded; in 1869, England only received them, taking them to the value of \$184,783. Nine years later the exports to Great Britain amounted to \$1,919,703; but since that date there have been some indications of a decrease, the quantity sent in 1879 being valued at \$1,832,948, and in 1880 to \$1,496,365. These goods were first sent to

Germany in 1871, to the value of \$184, while in 1878, the exports to this country amounted to \$97,319, since which time there have been indications of a tendency to decline.

France in 1872 took \$12,991 worth; in 1878, \$20,331; in 1879, owing doubtless to the exhibition of 1878, \$69,364; while in 1880-'81 a marked tendency to a decrease of exports has been manifested. The aggregates exported to Europe of this class of goods for a period of thirteen years, are as follows:

1869	\$184,783
1870	253,882
1871	254,426
1872	317,082
1873	344,677
1874	602,490
1875	1,070,703
1876	1,221,497
1877	1,710,063
1878	2,039,204
1879	1,982,644
1880	1,596,007
1881	1,902,100

Ought not the Government of the United States to take every possible measure to secure a permanence and further increase for this branch of commerce which has sprung up so briskly and in such a promising manner?

There are many minor products of the fisheries which are produced in great excellence in the United States and which should be introduced into foreign countries. For instance, the supply of sponges is practically inexhaustible on our Southern coasts. The American sponges are equal to any, with the exception of the finest grade produced in the Mediterranean; yet there is no record of their exportation. American glues and isinglass are surpassed by none and can be produced in enormous quantities and at a trifling outlay, utilizing now an almost worthless waste product.

The medicinal and lubricating oils—the former from the cod and candle-fish, and the latter from the heads of the smaller species of whales and porpoises—also deserve attention, as well as the Irish moss. The various kinds of mother-of-pearl produced in our Western rivers and on the Pacific coast; the seal skins of our Alaskan Territory, and the alligator, porpoise, and sturgeon leather may be also considered in this connection. The domestic sales of these different products are large, and they would, many of them, meet with favor abroad.

In addition to the commercial advantages which might accrue to the United States from the participation in this exhibition, much knowledge might be gained to this country by a careful study, on the part of experts, of the display made by other nations; though there can be but little doubt that the United States has more to show than it has to learn, yet substantial profit will very probably result from an examination of the implements and products, as well as the methods and processes, shown by the various representative countries, the results of centuries of experience on the part of their fishermen.

The value of the fishery products of the United States is equal to that of all the countries of Europe combined, being four times as great as that of Norway, the great fish-producing country of that continent. In view of this fact, and taking into consideration the undeveloped resources of this country, the United States may take part in the proposed exhibition with a feeling of certainty that it has much to gain by such an undertaking, and a just feeling of pride that the country which has been the most recent in introducing this new branch of industry is also the most successful.

Election Contest—Mackey vs. O'Connor.

SPEECH

OF

HON. SAMUEL DIBBLE,

OF SOUTH CAROLINA,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, May 31, 1882.

The House having under consideration the South Carolina contested-election case, Mackey vs. O'Connor—

Mr. DIBBLE said:

Mr. SPEAKER: I presume it will be admitted on this floor that in the matter of the right of a member to his seat two interests are involved, the private right of the individual, and the right of the people of the district to such representation as they are entitled to and as they have designated. So far as the first of these is concerned, and if that only were concerned, I would care little about your verdict to-day. I came here to an office which I did not seek, an office which I had publicly declined, and which afterward I accepted because a constituency demanded representation, and I thought it my duty to

come here and speak for their rights; for their rights I propose to speak to-day.

I have made certain assertions in relation to the conduct of this case, and I wish to remark now that in what I may say in relation to its conduct I do not propose to cast upon any member of this House any insinuation of improper motive, but merely to show from a statement of facts that the charge which I have made against this testimony has never been legally investigated. Let me relate its history.

I confess, Mr. Speaker, that while I might have expected of such a party as the Republican party in South Carolina (I mean the part of it which controls the party there)—while I might have expected almost anything from its past history and its present conduct, I had no suspicion that this manuscript was not the testimony as originally taken until a very recent period. On the fourth day of January of the present year, after I had been seated in this Congress for one month, the contestant in the case of Mackey vs. O'Connor served me with a notice (the first notice I had ever received from his hands) that before the Committee on Elections, on the record of that case, he intended to contest my seat. Advising with counsel it was thought proper that I should answer that notice. I had been informed, and I knew it only from information, (because I had to do with this record of Mackey and O'Connor the little matter of examining some seven or eight witnesses at the request of Mr. O'Connor's local counsel in my county, and I knew nothing of the papers)—I had been informed by Mr. O'Connor's general counsel in Charleston that a portion of the testimony had been taken after Mr. O'Connor's death. In order personally to verify this fact before I put it in an answer, (the testimony then being in the hands of the Public Printer,) I went to the Printing Office and there asked to inspect the written sheets, for the purpose of ascertaining by the dates of depositions to what extent such was the fact, so as to know it to my own knowledge. That was some time in the month of January last; I do not remember the day. In looking over those depositions to see whether they were taken in Mr. O'Connor's life-time or after his death, in Mr. O'Connor's own testimony—

A MEMBER. In Mr. Mackey's testimony.

Mr. DIBBLE. No; Mr. O'Connor's testimony. Mr. O'Connor's testimony was incomplete when he died, and never has been completed. I found interspersed in Mr. O'Connor's testimony, while I was looking for the dates of the depositions, numerous changes and interlineations which were in the handwriting of the contestant, whose handwriting I knew. That circumstance first directed my attention to the fact that something was wrong with that record. That was some time in the month of January last. I mentioned it to my counsel, who were General Paine (formerly a member of this House and a member of the Committee on Elections) and Mr. Earle, of South Carolina, who practices at the Washington bar. Upon their advice, and with one of them, I examined this testimony, and while we were engaged in that examination, in looking over the testimony of the contestant, the handwriting of C. Smith was recognized by Mr. Earle as the handwriting of some of the depositions, Mr. Earle having been a practitioner in South Carolina, and at one time having had some copying done by Mr. Smith. We also observed that a portion of the contestant's testimony was in the contestant's own handwriting, and another portion in the handwriting of somebody else known to neither one of us. That was some time about the last of January or the 1st of February. It was as soon as the testimony had come from the Printer. On that my counsel instituted inquiries; and in answer to the inquiries thus instituted the facts were developed, which were afterward set forth in affidavits, two of which are as follows:

AFFIDAVIT OF E. H. HOGARTH.

THE STATE OF GEORGIA, Richmond County:

Personally appeared before me, a notary public in and for the county of Richmond, E. H. Hogarth, who, being sworn, says: That he was a resident of the city of Charleston, State of South Carolina, during the year 1881, up to the 30th September; that deponent held the office of notary public during said time, and was a stenographer by profession; that he was employed by E. W. M. Mackey, esq., as stenographer and notary public in the contest between E. W. M. Mackey and M. P. O'Connor for a seat in the Forty-seventh Congress of the United States, and that deponent acted as stenographer, and sometimes notary public, in Orangeburgh County, in behalf of the Hon. M. P. O'Connor; that deponent took the testimony on the part of E. W. M. Mackey, esq., in the counties of Charleston, Orangeburgh, and Clarendon, with the exception of one or two depositions; that all of the testimony so taken by deponent as stenographer was transcribed from his stenographic notes in deponent's own handwriting, and testimony taken on behalf of E. W. M. Mackey, esq., was turned over to him in deponent's own handwriting, and such taken on behalf of the Hon. M. P. O'Connor was turned over in deponent's own handwriting to Robert Chisolm, Jr., esq.

This ended his (deponent's) connection with said testimony, except that afterward at various times he (deponent) signed certificates which were tendered to deponent by E. W. M. Mackey, esq., and also jurats at the foot of depositions; these deponent signed without comparison with his said stenographic notes, taking it for granted that said testimony was the same as furnished by deponent to said E. W. M. Mackey, esq.; that the said certificates were often presented to deponent for signature by said E. W. M. Mackey, esq., when deponent was otherwise employed, and that deponent did not have his stenographic notes at hand when he so certified said testimony; that deponent also certified the testimony taken on behalf of Hon. M. P. O'Connor in instances where deponent acted as notary public; that deponent did not forward any of said testimony to the Clerk of the House of Representatives, but turned same over to the respective parties named above; and deponent knows nothing of his personal knowledge concerning the forwarding of the same.

E. H. HOGARTH.

Sworn to and subscribed before me this 17th day of February, 1882.

[SEAL.]

WM. M. MILLER,

Notary Public, Richmond County, Georgia.

AFFIDAVIT OF C. SMITH.

STATE OF SOUTH CAROLINA, Charleston County:

Before me personally came C. Smith, in response to a summons to testify as to certain matters in a contest entitled E. W. M. Mackey vs. M. P. O'Connor, and who, being duly sworn, says: "I was employed by E. W. M. Mackey to write out the testimony taken in his behalf in the contest between himself and Mr. O'Connor for a seat in the Forty-seventh Congress; this writing was done at the house of Colonel Mackey, and at the United States court-house, and at my room. The body of testimony was in the handwriting of E. H. Hogarth, stenographer and notary public, and there were interlineations, erasures, and portions of the original sheets were cut out and other sheets substituted, and sometimes left out entirely; that sometimes nearly a whole page was struck out by drawing a line across it; that the interlineations were in the handwriting of E. W. M. Mackey; that the copy made by me omitted the erasures and inserted the interlineations; that sometimes whole pages of this testimony in the handwriting of Colonel E. W. M. Mackey would be inserted, and of which there was no original in the handwriting of Mr. Hogarth, the notary public, that I saw; that sometimes when I returned the originals and my copy of the same, Colonel Mackey destroyed the originals by placing them in a stove, or destroying them by tearing them up; that in some instances the copy made by me was returned interlined, and I made fresh copy with such corrections; the interlineations last mentioned were also in the handwriting of Colonel E. W. M. Mackey; that the notary public, Mr. Hogarth, placed his seal and signature to the testimony as it was handed to him without making any comparison with the originals, as in many instances, as before stated, the originals had been destroyed, and also without making any comparison with his short-hand notes; that is, in every case in which I was present, my impression is that I saw him sign nearly all of the testimony, certainly more than half of it; that in the case of W. A. Zimmerman the testimony as copied by this deponent was submitted to him for his signature, that he declined to sign the same until certain corrections were made in it, that the testimony as submitted was not correct, and that unless the corrections were made he would not sign the same; that this testimony of Zimmerman's I returned to Mr. Mackey and I never recopied it; and it was not signed by Mr. Zimmerman when I returned it to Mr. Mackey; that in the case of Major T. A. Haguenin the testimony as copied by me was handed to him; he glanced over it and said, "I suppose it is all right," and signed it; that I may have submitted other testimony but cannot now recall the other cases where I submitted them for signatures; that Mr. Hogarth in certifying these papers would certify a number of them at one time and without comparison as aforesaid; that I took a number of packages of the testimony to the express office and shipped them in the name of Mr. Hogarth to the Clerk of the House of Representatives; that the statements herein apply only to the testimony taken in Mr. Mackey's behalf. I know nothing about the testimony taken for Mr. O'Connor; that from the early part of January, 1881, and off and on during the summer months, and nearly up to the time that the last package of Mr. Mackey's testimony was sent off, I was copying. That the packages hereinbefore mentioned as shipped by me were given to me by E. W. M. Mackey, and I handed to him the receipt for the same, the said receipt being in the name of E. H. Hogarth.

C. SMITH.

Sworn to before me this 16th day of February, 1882.

[SEAL.]

H. L. P. BOLGER, Notary Public.

And my own statement and that of Mr. Earle show (and his statement is under oath) that on the 21st of February, when my communication was filed with the committee, we had proceeded with as much expedition as possible, with the view of getting it to the committee at an early period, and that there was nothing in this matter intended as a dilatory proceeding.

I ask the Clerk to read two portions of the communication which I sent to the committee and which will show the request I made of them on the 21st of February.

The Clerk read as follows:

These matters have come to my knowledge very recently, and the affidavits accompanying this communication will show that the charges I make are not without foundation; and an inspection of the manuscript testimony on file will corroborate the affidavits, while additional testimony can be obtained, as I am informed and believe, equally damaging to the character of the contestant and his testimony, should time be allowed for the purpose.

And I therefore request this committee to make due investigation of these matters, and to ask leave of the House of Representatives to summon the witnesses whose depositions accompany this communication, together with such other witnesses as may be named by the said contestant and myself, respectively, to testify touching the truth of the charges aforesaid, in case the contestant deny the said charges, or to take such other means as may be just, fair, and lawful to ascertain the same; and that the testimony on file in the said case of E. W. M. Mackey against M. P. O'Connor be stricken out, and declared to be fictitious, unreliable, and void.

Mr. DIBBLE. Now, Mr. Speaker, a good deal has been said in this debate about Mr. Hogarth not having been summoned here with his stenographic notes as the original testimony; and it has been said by at least two of those who have spoken on the other side of this case that such was not my demand. There it is, Mr. Speaker, "to ask leave of the House of Representatives to summon the witnesses whose depositions accompany this communication." Who were these witnesses that I asked to be summoned? Hogarth, the stenographer, was one of the witnesses, and C. Smith was another. I asked that they be summoned, and I asked that the matter be investigated. Now, how much delay would it have caused to have granted that simple request?

But that is not all. There was filed also at the same time by my counsel a separate motion on a point of law to suppress the affidavit. All lawyers in this House on both sides will appreciate that this is a matter for fair argument, at the least. I will say that my counsel, who has been justly credited with great acumen in election cases, said that the position was invincible. The point made was that the notary had not certified, as the law requires, that the depositions were written out in his presence. The authorities which he cited were principally authorities from the Supreme and circuit courts of the United States. That motion was filed at the same time.

A meeting of the sub-committee was called—I have it from the records—for the 26th day of February to consider my request and to hear this legal motion. On the 23d of February—I have the letter here—I was notified that that meeting was postponed by order of

the chairman of the sub-committee until the 1st day of March, when the sub-committee met.

Now, what did that sub-committee have before them that day? They had a motion to suppress the depositions on a legal ground, and they had before them my request that they should investigate this matter and summon witnesses in regard to it. I had stated in my communication that by inspection this testimony would furnish sufficient grounds to lead them to inquire further.

I said to the sub-committee that day that I could not ask them to pass on so grave a charge on the *ex parte* affidavits of Hogarth and Smith; that I had put in those *ex parte* affidavits to show that I had foundation for making the charge; but that the contestant in this case was entitled to cross-examine the witnesses, that it would be but fair to him to give him that opportunity; and I said also that it would not be fair to me unless I had the privilege of cross-examining such witnesses as the contestant might produce in defense against this charge.

Apart from those principles of law which lawyers will appreciate, I had for that assertion direct authority from a precedent of this House, a report made by the Committee on Elections of this House, which I send to the Clerk's desk. I ask him to read the portion I have marked on page 2 of that report.

The Clerk read as follows:

As no authority in either case was given to the committee to take testimony, the sole authority of the committee rests on these references, on the rules of the House, and on the laws of the United States. There is no law, and no practice of the Committee on Elections, as we understand it, authorizing the use by the committee of *ex parte* affidavits to determine questions of facts in deciding the merits of an election case.

The power of the House to judge of the elections, returns, and qualifications of its members is ample, and it can proceed in its own way; a committee of the House has such power as is given it.

The importance of election cases demands that the testimony should be taken on notice to all persons interested, with the right on their part to cross-examine witnesses and to exhibit testimony in reply, so far as their rights may be affected by the inquiry.

This may be done under or after the analogy of the statute relating to contested elections, or by summoning witnesses before the committee, or in any other manner the House may direct.

None of the certificates or affidavits found in the papers in a judicial court would prove themselves or be judicially recognized, except the certificates of the sitting members.

Mr. DIBBLE. I now ask the Clerk to read from page 3 of that report.

The Clerk read as follows:

In determining what should be done with the petitions, the undersigned were of the opinion that the affidavits and certificates accompanying the petitions should be regarded as offers of proof; that is, statements by the petitioners of the facts which they propose to prove, and that the committee should consider whether, if all these statements of facts were taken to be true, the petitions could be maintained.

Mr. DIBBLE. I now ask the Clerk to turn to page 18 of the report and read the names of the members of the committee signing that report, and I ask the attention of the House to the distinguished signatures annexed to that report.

The Clerk read as follows:

W. A. Field, J. WARREN KEIFER, W. H. CALKINS, JOHN H. CAMP, J. B. Weaver, E. Overton, Jr.

Mr. DIBBLE. I have made these citations from the prevailing report of the Committee on Elections on the Iowa contested-election cases. That is good law. I would have no right to demand of the Committee on Elections that they should condemn that testimony on *ex parte* affidavits. Those affidavits were only offers to prove the charge I had made. I asked for an inspection of the testimony and for the summoning of witnesses. That was denied.

What was done by the committee? I had the testimony before me on the table and I told the committee that I wished to show them some alterations, so that they might judge themselves then and there about it. They cleared the room, and passed a resolution that all affidavits on my part should be filed that day; that the contestant should have two days longer, and that on the next Monday there should be argument on the two motions, each side to be limited to one-half hour. That is all the opportunity that was ever offered to me to put in proof to sustain this charge.

I devoted the rest of the day to calling attention by my own affidavit to some alterations. I would say that they were not the alterations upon which the distinguished gentleman from Massachusetts [Mr. RANNEY] commented, and whose comments seemed to create some pleasantries on that side of the House. They were material alterations to which I invoked their attention. One of the gentlemen has said that those alterations did not affect the polls referred to by fourteen affidavits. Allow me to say that one of them was in relation to one of those very polls. The gentleman has not carefully inspected the record. Had he done so, he would not have stated in his argument that every one of the fourteen depositions affecting those precincts is unchallenged.

But I must pass on. As to the affidavit filed on that day I added by affidavit what I had already stated before the sub-committee, that the only testimony I could procure to sustain my charge was the testimony of friends of the contestant himself; that I could not get their testimony without the power of the House, which I asked the committee to invoke. In my affidavit filed that day I made that statement under oath. The next morning before the contestant's time for filing affidavits had expired, and before any of his affidavits

had been put on file, I received an affidavit stating in so many words that the party making the affidavit had seen Mr. Mackey scratching out the testimony, and Mr. C. Smith writing it over; that he had seen Mr. C. Smith hand to Mr. Mackey written sheets which he believed were the original testimony, and that Mr. Mackey tore them up and placed the pieces in a stove. He named three persons whom he swore he had seen reading the original sheets for C. Smith to copy from their reading. This affidavit was received the next morning.

Mr. RANNEY. Did you not know that the party making that affidavit could neither read nor write?

Mr. DIBBLE. I did not know him at all; but I did know (and I now challenge any man to prove the contrary) that that affidavit was properly taken; the notary was the peer of any one on this floor in reputation for official integrity, and his signature is genuine.

Mr. RANNEY. But if the witness could not read and write, he could not tell what the paper which was destroyed was.

Mr. DIBBLE. There is no proof that he could not read or write. There is, of course, the allegation of the contestant to that effect as to the affiant's signature, which I challenged him on the spot to put in the form of an affidavit; and if he has ever done so I have not seen it. [Applause on the Democratic side.]

Mr. RANNEY. There were filed with the committee three affidavits—by the clerk of the court and others—saying that the witness could neither read nor write.

Mr. DIBBLE. Not so, Mr. Speaker; that affidavit signed by a reputable notary was refused on the ground that it was too late. I had had my "day in court"—from twelve o'clock until the expiration of the same day! This affidavit coming the next morning, served on the contestant at the suggestion of the chairman of the sub-committee and filed with the committee on the same morning—served on the contestant a day before his time was out—was excluded because it was too late. This is all the opportunity that the committee ever gave to me to sustain this charge.

On the 1st of March the sub-committee met and allowed half an hour to a side. General Paine, after having occupied most of his time in an able legal argument, citing authorities for the legal points, was proceeding to discuss the other questions, when, having been granted the grace of five minutes, he was rapped down at the expiration of thirty-five minutes and given leave to print! I stated to the committee that I had somewhat to say in regard to the facts connected with this charge of forgery. Did they give me time? They said my time was exhausted. I then said to them that I would like to print. They gave me leave to print. That is what they call investigation of this case!

Now, as to the other side. The contestant filed on Friday evening a number of affidavits, some eighty or more; and they were sent to the Printer. We saw them Saturday evening. On Monday morning we had to argue the question. There was barely time to read those affidavits. There was no chance for rebuttal or cross-examination; and on one of the affidavits filed that day, the affidavit of the notary sustaining the accuracy of fourteen depositions, gentlemen of this House are told the whole case is to hang. I say, first, this is not what the committee say in their report. I will read the resolution of the committee. After such opportunity for investigation as I have explained, the committee, ignoring entirely the request to summon witnesses, adopted by a vote of 3 to 2 this resolution:

Resolved, That the motion of Mr. Dibble to strike from the record all depositions heretofore taken in the case of Mackey vs. Dibble be overruled and that Mr. Dibble be forthwith required to file his brief on the facts of the case, and that Monday next, the 20th instant, be fixed for final argument.

With this record before them, on which the charge of fraud is made, the committee, on such investigation as I have explained, adopted this resolution, and when they now come to this House and say that they discard all but fourteen of the depositions in this volume I say that they have put me to trial on the whole as to my right to the seat.

But, Mr. Speaker, my time is rapidly passing; and I must devote a little to the legal propositions involved here. I suppose that no lawyer on the other side will gainsay the proposition that if a claimant to a seat came here with *ex parte* affidavits to sustain his claim the committee would reject such evidence as not taken under the statute.

Now it is admitted that the written evidence here is not the evidence which the notary transcribed from his stenographic notes in the first instance. Neither is it the stenographic notes themselves. But it is said this affidavit of the notary taken *ex parte* makes that good testimony. That is, that an *ex parte* affidavit can make testimony out of that which in the original case would not be testimony, and which, under the distinguished authority I have cited, is expressly repudiated as testimony.

The alterations of this testimony, Mr. Speaker, were made principally after the death of Mr. O'Connor, and the alterations in his testimony were made after my election and without notice to me.

Now, I pay a fitting tribute to Mr. Charles O'Connor when I say that his intentions are not to be questioned; but I say that if I was to be affected by this testimony (and that is the position taken by the committee) after my election not one particle of correction ought to have been made in that testimony without notice to me. Mr. O'Connor did not represent me. The proceeding was entirely *ex*

parte. A young man not a lawyer, not one of the attorneys of Mr. O'Connor, without any bad intention, but still in contact with the superior experience of the contestant, who is an able lawyer and has had much practice in cases of this kind—I say, if this testimony was to be used in my case it was an injustice to me that it should be corrected *ex parte*.

And I will say to the distinguished lawyer from Massachusetts, [Mr. RANNEY,] who talks about his familiarity with stenographic testimony, that he would not in any case undertake *ex parte* to correct testimony.

Mr. Speaker, how much of my time have I remaining?

The SPEAKER. Twenty-three minutes.

Mr. DIBBLE. Something has been said, Mr. Speaker, about elections in South Carolina. Great exhibition has been made of some tickets by the member from Pennsylvania on the other side, a member of the Elections Committee—some of the tickets of Charleston, and perhaps of Clarendon County, which he calls tissue ballots.

I will also show to the House the tickets which were used in that election in my own county by both sides, by Democrats and Republicans. And now I will send to the Clerk's desk a certain ticket to be read, and ask the House to look at it and they will see the genuine tissue ballot.

The Clerk read as follows:

UNION REPUBLICAN TICKET!

For 46th Congress—2d District.

EDMUND W M MACKEY

For Senator.

JAMES B CAMPBELL

For House of Representatives.

Andrew Simonds C G Memminger

Francis S Holmes Edward McCrady Jr

John H Thiele Stephen H Hare

William J Brodie James A Williams

Joseph J Lesesne James Hutchinson

Nathaniel Morant Frank Ladson

William G Pinckney Renty K Washington

Andrew Singleton Warren N Bunch

James Singleton

For County Commissioners.

Louis Dunnemann William H Thompson

Richard Bryan

For School Commissioner.

Michael M McLaughlin

For Judge of Probate.

Charles W Butt

Mr. DIBBLE. I commend to the members of the House on the other side that genuine specimen of the original tissue ballot, and I would like them to compare it with the tickets exhibited by the member from Pennsylvania. I think they will find it is thinner and smaller.

Mr. SPRINGER. Where does it come from?

Mr. CAMP. I would like to compare it with one voted two years before, when O'Connor was returned.

Mr. DIBBLE. Now, something as to the duty of county canvassers in South Carolina. It has been proclaimed on the floor of this House that canvassers in South Carolina are merely ministerial officers, and a great deal has been said, because they refused to count certain boxes, that it was in manifest violation of the law. I will read an extract from the opinion of the supreme court of South Carolina in the case of the State *ex rel*. Walker, in which Mr. Justice Willard, an eminent lawyer and a Republican judge, one whose ability is unquestioned and unchallenged, where he uses the following language in relation to county canvassers in South Carolina:

Under our laws there are two bodies intrusted with the power to ascertain and fix the fact of an election for State and county purposes, one acting as a primary tribunal, the other as a revisory body. The board of county canvassers is the primary body, and the board of State canvassers is the revisory body. To say the election fails unless a proper declaration is made by a board of State canvassers is to destroy entirely the functions of the county board.

And the same opinion of the supreme court which has been alluded to in the argument of counsel on the other side of this House states that down to 1868 the law in force undoubtedly gave the board of managers quasi-judicial powers to hear and determine the validity of the election. And the opinion of the supreme court in this very case affirms that power in the county canvassers.

At the time of the election, November, 1880, all the judicial authorities in South Carolina, both Republican and Democratic, had affirmed, without variation, the power of boards of county canvassers to hear and determine judicially the facts of the election at every poll in the county. The ticket of South Carolina at that election was a general ticket. Every office from Presidential elector down to the lowest

office in the county was on one general ticket; and as to that ticket, in November, 1880, names for all State and county offices were upon it.

The county board had certainly, as to all State and county officers, the right judicially to determine the question whether a box ought or ought not to be counted, and when they exercised that judgment they exercised it in compliance with the terms of the law as it had been declared by the highest tribunals in the State; and I say here, Mr. Speaker, that so far as it was within the range of my knowledge, so far as that portion of the field of the election is concerned, of which I know as county chairman of the county of Orangeburgh, the circumstances connected with the polls which were thrown out would render it a disgrace for them to be counted in any of the States of this Union from Maine to the Pacific coast. I say to you, gentlemen from New England, that such a poll would have been thrown out in any part of New England. I will print in connection with my remarks a portion of the testimony in support of this statement, as I have not time now to read it:

Extracts from illegal instructions issued to deputy United States marshals unlawfully appointed at country precincts.

Instructions to United States deputy marshals; their duties in connection with the Congressional and Presidential election on 2d November, 1880.

UNITED STATES MARSHAL'S OFFICE,
DISTRICT OF SOUTH CAROLINA, November 1, 1880.

To _____, esq.,

Deputy United States Marshal:

SIR: You will report at 5.30 a. m. on the morning of the election to the deputy marshal who may be designated chief deputy at your voting precinct. You will remain subject to his orders during the election, and until all the votes regularly cast are counted and necessary returns are made up and signed by the managers of the election and copied by the supervisors. The said chief deputy is authorized to suspend you from office for any official or personal misconduct.

Every deputy marshal and special deputy marshal will be provided with a badge and commission, signed by the United States marshal.

The laws of the United States (sec. 5522, U. S. Rev. Stat.) authorize you to have free access to and from the room in which the election is held and the ballot-box is situated, and authorize you to remain sufficiently near the box to observe the manner in which the election is conducted and how the votes are counted.

You are authorized (sec. 2022, U. S. Rev. Stat.) to arrest without a warrant any officer, manager, or person who may, in your presence, or the presence of the supervisor, commit, or offer to commit, any of the following offenses:

1. The refusal of any officer or manager of election on any pretext to receive and count the vote of any qualified voter of the county and State who is willing to take the prescribed oath.

3. The reception by any officer or manager of election of the vote of any person not entitled to vote, or who has already voted, after proper challenge of the said vote. (Printed record, page 663.)

Opinion of Hon. George S. Bryan, United States district judge, delivered at United States court-house, at Charleston, South Carolina, November 1, 1880:

There is one point so definitely made that I feel at liberty to declare myself upon it. It is my judgment that the marshal has no right or authority to appoint special deputy marshals outside of cities with 20,000 inhabitants and upward, and that he has no right in a different form and method to appoint general deputies for a special purpose. The law denies that power to him expressly. The function of the supervisor in the country is simply that of a witness. All those things which are proper to the discharge of that function he has a right to do. He has the right to see the vote and canvass the vote. He has the right to do all those things which would make him a proper and efficient witness for the candidates for Congress, who rely upon him to protect their rights and to see that they have an equal chance. This is the duty of the county supervisor. That, and no more.

Decision of United States circuit court in case of United States vs. Gitma, 3 Hughes, C. C. Rep., page 552.

The following is, therefore, the ruling of the court:

Unless it is shown that a disturbance of the peace has actually occurred, or violence is committed, or that one or the other is threatened, or that actual fraud is attempted, or that the supervisor is in actual need of protection in the room of the judges of election, the deputy marshals of election have no right to be in the said room against the orders of the judges of election during the progress of the voting. But if there be actual disturbance of the peace or other actual violence committed or threatened, or if the supervisors be in actual need of protection, or fraud be attempted in the said room, then the deputy marshal may enter the room for the purpose of discharging the duties imposed upon him by section 2022.

LEWISVILLE (OR SAINT MATTHEW'S) PRECINCT.

Part of testimony of Captain F. M. Wannamaker, (printed record, pages 605 and 606:)

Question. What was the conduct of the five United States deputy marshals on the day of election?

Answer. They claimed, in the beginning, extraordinary powers; they asserted their right of arresting the managers and superintending the election, and they claimed free egress and ingress into the house where the election was held; they produced instructions which purported to come from Wallace, which allowed them to arrest the managers. Upon my remonstrating with them they agreed to remain outside; subsequently one of them forced himself into the room, and refused to go out even upon the demand of the United States supervisors; he was under the influence of liquor, and others of the five marshals were presumably under the influence of liquor. On the persons of two of those marshals I saw weapons, so as to be visible—pistols.

Q. Did any of these United States marshals say anything to you in relation to their being backed by force?

A. Yes, sir; one of the United States marshals, and another one of their partners that was with him, said that each of these United States marshals was in command of not less than one hundred armed men.

Q. Did you see around and about the poll anything corroborating that statement?

A. The night preceding the election I arrived here on the eight o'clock train, and already parties of armed colored Republicans were arriving in the town to such an extent as to alarm the citizens. I was requested to stay here and organize some party for the protection of the town. At the poll on the day of election, I saw quite a number of armed Republicans. I walked up to a man named Joseph Mitchell and showed him how he was exposing his pistol. Another one I caught

hold and showed him how he was laying himself under the law. One told me he was doing nothing but what all were doing, that they all had arms.

Q. How many do you estimate were here?

A. During the day there was on an average about eight hundred to a thousand; during the evening they were re-enforced by every boy from twelve years and upward; they came here in parties and by concert; I estimate the body that was here during the evening at the poll was from twelve to fifteen hundred. The crowd was much larger after the poll closed than during the day; they were boys brought here organized; they were brought here for the purpose. As to a number of arms being here there can be no doubt, because the firing was done immediately after the poll closed; from five hundred to a thousand discharges immediately after the close of the poll and immediately in the vicinity of the poll, and in going home (I live not more than a mile and a half from here) I passed not less than one hundred armed colored men between here and my home. Further than that, I know from my own personal observation and from information that a very large amount of ammunition was bought by colored Republicans before the election, and reports were made to me of the danger in consequence of it. I noticed the sales of a caliber of pistol shooting a number thirty-two cartridge were bought almost universally.

Q. Do you know, from your observation, instances of colored persons who desired to vote the Democratic ticket and were prevented by this system of open voting and intimidation?

A. I know from what they told me that they would vote the Democratic ticket if they would not be exposed. The system adopted they recognized was to bring them under the ban of their race, and they could not do so without being exposed; in every instance when they told me so I advised them not to vote if it cost that much. I told two that myself.

Q. Were any colored persons in the neighborhood who were known to have the intention of voting the Democratic ticket and were interfered with in any way?

A. I know one man named Israel Jamison, who lived here; he gave me the information personally of having been arrested before the election on account of his avowed intention of voting the Democratic ticket, and has since left the place on account of the persecution he has suffered. I know on the day of election that a long line was formed of Republicans, from here to Dr. Fair's corner, and that any man that came along in the company of a white Democrat, or was known to be of Democratic proclivities, he was exposed to the jeers and scoffs of the crowd.

Q. Did those deputy marshals take any part in distributing tickets?

A. I cannot say positively I saw them giving out tickets; I did not observe that.

Q. Did they do anything toward influencing voters?

A. Yes, sir; they were rallying the negroes; they would catch hold of them and demand their tickets.

Q. You say you saw them demand to see the tickets of the voters?

A. Yes, sir; I saw them take the tickets out of the hands of voters.

Q. All five?

A. I cannot say all; some of them did.

Q. Which one?

A. I saw Jack Philips do it, and Henry Johnson did it repeatedly.

Q. Do you not know that the object of the Republicans in voting an open ticket was that the managers might see that each Republican voted a single ticket?

A. I think nothing of the kind was designed by it; on the contrary, I am fully convinced that it was done to force the colored men who would have voted a secret Democratic ticket to vote an open Republican ticket.

Q. Did not the Republicans approach the poll with their tickets open, hold them up in their hands, and fold them after they were sworn?

A. Quite a number of them came up; I don't know whether they had them concealed; they would call out, "Hold up your ticket," and he was made then to hold up his ticket.

Q. In all cases they held up their tickets before being sworn, and folded them after being sworn?

A. I cannot say in all cases.

Q. I mean in all cases you saw.

A. I did not observe them particularly; I knew what their plan was; I heard some of the leaders say that some of the damned rascals—they would take note of them that voted the Democratic ticket.

Q. What marshal was it that told you that each marshal was in command of an armed body of not less than one hundred men?

A. Curley Major told me, in the presence of Jack Philips; he made the statement in his presence.

Part of the testimony of John M. Payne, (printed record, pages 613, 614:)

Question. Where do you live?

Answer. In this county.

Q. Near this place?

A. Yes, sir; within three miles.

Q. Is this your polling precinct?

A. This is.

Q. Were you present at this poll at the last general election?

A. I was here about one hour and a half in the morning.

Q. State what was the condition of the poll when you were there.

A. I heard the poll was going to be taken possession of, and when I got here there was a mass of colored Republicans blocked up here, so that it was impossible for a man to get in; I staid here one hour and a half, and I went away myself, and Dr. Shiver, he said he could not get to the poll, and he was not going to make trouble over it.

Q. You are positive when the Republican voters voted that by apparent concert they would take possession and block the avenue to the poll?

A. I believe that from what I heard.

Q. And from what you saw?

A. Yes, sir.

Q. Did you vote at all?

A. No, sir.

Q. Was the obstructions created by the block the only reason you did not vote?

A. I heard others say that they were going to carry the poll if they had to fight.

Q. Will you state the threats and what they were that you heard?

A. I heard them say they were instructed by Mr. Mackey and Bolivar that if they lost this election they would be sold into slavery; I heard this a number of times; I could not tell how many; that they had guns, and they had more guns coming, through the marshals here in Lewisville, and they were determined to carry that election if they had to kill every man, woman, and child in South Carolina.

Q. You left, then, in consequence of your fear of a riot?

A. Yes, sir; I believed they were going to have it, too, but they got scared afterward; they had their preparation made, but they changed their intention.

Q. What time you left the poll?

A. It was early, perhaps about 8 o'clock, and staid one and a half hours. I got home before 12 o'clock; I walked moderately.

Q. What was your connection with the last war?

A. I was in the Federal Army from the beginning to the end of the war. (Objected to by counsel for contestant, on the ground of irrelevancy.)

Printed record, page 615, (same witness:)

Question. Who did you say went away with you?
 Answer. Dr. Shiver. Four men overtook me in the road and said they left on the same ground I did; they could not get in.
 Q. Were you present during the voting any time?
 A. About one and a half hours.

Part of testimony of Captain Henry Davis, jr., (printed record, page 617:)

Question. Did you see any persons present claiming to be United States deputy marshals?

Answer. Yes, sir.
 Q. How many?
 A. I think there were five.
 Q. Were they white or colored?
 A. All colored.
 Q. Were they Republicans or Democrats?
 A. I think they claimed to be Republicans; I took them to be such.
 Q. State the conduct of those deputy marshals on that day; anything that came under your observation.

A. The United States marshals acted as if they had authority to control the election, and even when the voting was going on they took charge. (Objected to by counsel for contestant.) I will state during the day one of the marshals went into the room occupied by the managers and supervisors without the consent of the managers and supervisors.

Part of testimony of H. A. Rayson, (printed record, pages 620, 621:)

Question. Did or not any of those parties claiming to be deputy United States marshals interfere with the managers of election?

Answer. One did; Henry Johnson. He forced his way into the room against the protest of the managers and supervisors.

Q. State how it interfered with the managers.
 A. It interfered so much that the poll was closed for a half hour, or the voting was stopped. This Henry Johnson displayed his papers to the managers and supervisors, which said that he was allowed the privilege of staying there, and managers and supervisors read it and told him to leave the room, contending he had no right there. After some words passed, they got some instructions from the commissioner of election that he was not allowed in there; that he had no legal business in there, and he was persuaded to leave by the supervisors of both parties and his friends outside.

Q. During the time he was in there the election was entirely suspended?
 A. Yes, sir; for a half hour or more.
 Q. What occurred immediately after you completed the canvass, and when, as Mr. Clark said, you accompanied him home?

A. When the votes were canvassed and the returns put in the box, and the box sealed up, we were going out with the box, and in going out of the room Mr. Clark, Mr. Davis, and myself, amid jeers and threats, and at times were very nearly run over by persons on horses, who wished to see the box in Orangeburgh or do us personal harm, I don't know which.

Q. By whom—you mean to say you were molested on the way?
 A. Yes, sir; by colored Republicans.
 Q. What occurred at the end of the lane?
 A. After we turned the corner, by Dr. Fair's store, Mr. Clark asked them what they intended to do. They said they wanted to see the box carried off that night. When we got opposite Mr. Clark's store the crowd got demonstrative, and Mr. Clark told them if they wanted the box he would give it to them. They said they were not after the box; they were after Mr. Clark, personally. We then crossed the railroad and deposited the box at Mr. Clark's store. Immediately after the box was deposited firing was heard all over the town.

Q. Do you know by whom those arms were discharged?
 A. By colored persons who voted the Republican ticket.
 Q. How near to the polling precinct and how near the closing of the count?
 A. Ten or fifteen minutes before the polls closed, and about one hundred and fifty or two hundred yards from the room where the poll was held.
 Q. Within the corporate limits?
 A. Yes, sir; on the principal street in the town.
 Q. Have you ever heard any threats made in regard to this election by anybody before or since the election?

A. Not before.
 Q. Did you hear any since or at any time?
 A. Yes, sir; I heard one Sam Middleton state that if this poll had gone Democratic, and that if there had been one pistol fired, there would have been not one house left in town, and they were all prepared for any emergency.

Q. How soon after the election was that?
 A. One day after the election.
 Q. Did you observe whether or not the Republican voters left the precinct after voting?

A. They did not; that is, the majority remained.
 Q. Give some estimate of the crowd that remained here and were present here at the counting of the votes?
 A. I don't know how many were here when the counting of the votes was going on; at the close, when we came out, there were about eight hundred colored persons here; I saw no white persons except those that came out with us.

Part of testimony of W. C. Clark, (printed record, page 625:)

Question. Were there any persons present claiming to be deputy marshals?

Answer. Yes, sir.
 Q. How many?
 A. Four or five, I think.
 Q. Did they assert any right of interference or control of the managers? (Objected to by counsel for contestant as leading.)
 A. Yes, sir.
 Q. Did they interfere with the managers?
 A. Yes, sir; they did. Henry Johnson came in; he forced his way into the house by climbing over the railing, and stopped the voting over one hour. We tried every way to get him out; he would not go out until some of his own party persuaded him out.
 Q. Were both of the United States supervisors present?
 A. Yes, sir; I think they were.
 Q. Did they or not object to his being in there, and told him to go out?
 A. Yes, sir; they did, or one of them did, after awhile, after we read the law, and saw he did not have any right there.
 Q. Did he go out right away on their request?
 A. No, sir; he refused.

Printed record, page 670:

THE STATE OF SOUTH CAROLINA, County of Orangeburgh:

Before me personally came Charles F. Zeigler, who, being sworn, made oath that he is a citizen of Saint Matthews, in said county, where the Lewisville poll was held at the election of November 2, 1880, and that during the night, after the

count of the vote, a large mob of negroes passed by deponent's house in the said town, yelling and firing off pistols, and that such yelling and firing of pistols was general in different directions in the said town at that time, although it is contrary to the town ordinances to discharge any fire-arms in the streets of the said town, and that the said pistols were loaded with balls as deponent knows from the fact that a number of the pistol-balls struck deponent's house, where deponent and his family resides, and that the firing of pistols continued for at least twenty minutes, and deponent estimates that at least five hundred shots were fired in the streets of the said town, and on the roads leading out of said town, by negroes going from the polls at the time above mentioned.

C. F. ZEIGLER.

Sworn to before me this 8 November, 1880.

W. H. HINNON, Trial Justice.

Printed record, pages 670, 671:

THE STATE OF SOUTH CAROLINA, County of Orangeburgh:

Before me personally came Saxby Chaplain and made oath that he is a citizen of the town of Saint Matthews, in the said county, where the Lewisville poll was held at the election of November 2, 1880, and that on the day after the election deponent was told by Sam Middleton, a colored Republican of the said precinct, in answer to an inquiry by deponent as to the reason that the negroes went off shooting their weapons, that they (the negroes) were prepared for us, (the white men,) and that if there had been a pistol fired by any of the whites there would not have been a house left in Lewisville.

S. CHAPLIN.

Sworn to before me this 8th November, 1880.

W. H. HINNON, Trial Justice.

FOGLE'S PRECINCT.

Part of testimony of W. L. Glaze, (printed record, pages 590, 591:)

Question. Go on and state what occurred there at that poll?

Answer. About half past six Mr. Shiver came with the box—between six and half past six—and proceeded to open the poll, and there was some disturbance arose about that time, which delayed it.

Q. What was the cause of that interference?
 A. The interference of some of the pretended deputy marshals.
 Q. Do you know any of them?

A. Yes, sir.
 Q. State who they were?
 A. There were three of them, Israel Brown—he seemed to be the leading spirit—Benjamin Esau, and another man named Caleb Barden.

Q. Did they all claim to be United States deputy marshals?
 A. They did, and wore badges.

Q. What was the manner of their interference?
 A. They wanted to come inside with the managers, and the managers told them they would not allow it. I think Mr. Mack, and perhaps Mr. Shiver, told them they had no right to come in, and they would leave the ballot-box, and would not conduct the election if they were interfered with as they intended to do.

Q. And this delayed the opening of the poll?
 A. They went off, and the poll was opened, they left the ballot-box about two minutes. I am certain it delayed the opening of the poll, and when Brown insisted upon coming in some parties had voted, but I am not certain about that. Brown and his crowd came out of the room where the managers were holding the poll. I was well acquainted with him and advised him that he had no right to be in there; he said he had his instructions, and he did not intend to come out until the votes were counted, and that he was going in by all means.

Q. By this interference was the voting impeded?
 A. It was.
 Q. How long did this interruption last?
 A. It did not last very long; as soon as they left the house they proceeded with the election; I don't know how long; I suppose a half hour, perhaps longer.

Q. Are you well acquainted in that section?
 A. I am pretty well. I lived there two years. I taught school there.

Q. Know the voters in that section?
 A. A great many of them. I know all the whites and a great many colored.

Q. Did any white voters leave the poll in consequence of these interruptions?
 A. They did.

Q. And did not vote?
 A. They did not vote. I think there were not more than ten or twelve whites who remained there, perhaps fifteen.

Part of testimony of J. W. Mack, (printed record, page 570:)

Question. Were you one of the managers at Fogle's precinct?

Answer. I was.
 Q. At the last general election—2d November, 1880?

A. Yes, sir.
 Q. Was there or not any interference by the so-called Republican marshals on that day?

A. There was.
 Q. Was the election interrupted or not on that occasion by this interference?

A. It was.
 Q. What caused this interruption?
 A. It arose from the interference of the so-called deputy marshals, or some sort of marshals; they claimed to be marshals.

Q. What did they do?
 A. They wanted to take the room from the managers; they tried to do it; in fact they wanted to be with us, and I would not submit to it.

Q. Did it interrupt the opening of the poll?
 A. It did.

Q. How long were you delayed?
 A. I don't know, I did not have any time-piece; I suppose a half hour.

Q. By their interference?
 A. Yes, sir.

Q. Were you interrupted so much as to have to leave the box at any time?
 A. I was.

Q. Do you know, of your knowledge, that any Democratic voter that came to that poll had to leave or did leave without voting?

A. Yes, sir; there were several; I don't know that I could particularly call their names, but I know several left—a good many.

Q. At the close of the election was there any further interference?
 A. Yes, sir; there was.

Q. What did that interference consist of?
 A. They appeared as if they wanted to count the votes or have a hand in it; I left the box once on that account myself.

Q. Who was this party who interfered with the counting of the votes?
 A. Benjamin Esau was one and Israel Brown was another; I think the other man's name was Barden.

Q. How many men did you see the deputy marshals make show their tickets?
 A. Every one, I think.

Q. Are you sure this was a deputy marshal?
 A. I think he had a hand in it.
 Q. Which one had a hand in it?
 A. He made them show their ticket before voting.

Q. How do you know he had his instructions to make people show their tickets?
 A. He showed it by his actions.
 Q. You judged he was so instructed because of his actions?
 A. It appeared so to me.
 Q. You did not see his instructions, or he did not tell you what his instructions were?

A. It was not my business to ask him about that.
 Q. Did you leave the box any time during the day because of the interference of the deputy marshals?
 A. Yes, sir.
 Q. What time in the day?
 A. I don't know; I did not have any watch.
 Q. From the time the voting began until the poll closed did you have to leave the box because of the interference of the deputy marshals?
 A. I think I did.
 Q. In what way did they interfere?
 A. By making confusion.
 Q. What was the confusion?
 A. They interfered where they had no right to.
 Q. Will you please state how they interfered where they had no right?
 A. I did not think they had the right to stop the men and make them show their tickets, and talk so much.
 Q. How many deputy marshals were there?
 A. Three.

Q. At the close of the poll when the votes were counted, did you and the other managers make out a protest and put it in the ballot-box?
 A. Yes, sir.
 Q. Are you absolutely certain of that?
 A. Yes, sir; we sent our protest.
 Q. To whom did you send your protest?
 A. We put it in the box with the tickets.
 Q. Who was it addressed to?
 A. It was addressed to the commissioners of election.

Part of testimony of James H. Shirer, (printed record, page 579:)

Question. Did the marshals in any way participate in the counting of the votes?
 Answer. I could not say that they did. Only one had the handling of the votes.
 Q. You say one had the handling of the votes?
 A. I did.
 Q. How many did he handle?
 A. I did not count them.
 Q. Did he handle them against the wishes of the managers?
 A. He did. The managers did not submit to it peaceably.
 Q. Will you please state what he did in regard to the handling of the votes?
 A. He put his hand in the box among the votes.

Part of testimony of T. N. Slawson, (printed record, page 583:)

Question. This man Green, was he a white man?
 Answer. He was a colored Republican.
 Q. Who called him in there?
 A. Israel Brown.
 Q. You say the paper he read was the instructions from Wallace to the deputy marshals?
 A. Yes, sir.
 Q. And it contained a clause that they had the power to arrest the managers?
 A. Yes, sir; to arrest the managers.
 Q. At the close of the poll, were there many Democrats there?
 A. I don't think there were over a dozen. I think there were 250 or 300 Republicans, and they were all well armed.
 Q. Do you know of any of them discharging their arms shortly after?
 A. Yes, sir; as soon as I got out of the house. I told Brown, who was a prominent man among them, that I wanted them to behave and go home quiet; he had said that day that he expected a row, and they were going to be prepared for it.

Q. The firing was done by whom?
 A. By the Republicans.
 Q. As they left the poll, going off?
 A. Yes, sir; going off.
 Q. You say the United States deputy marshals assumed authority to arrest the managers?
 A. They claimed that right if we did not do what they wanted us to do.
 Q. When did they first make that claim?
 A. After they came in the room. We had no objection to their coming in the room. It was on account of the noise. It was so much that we could not count the votes properly. After talking with them some time, I suppose one hour, they refused to go out; then this man Green was called in, and he read this paper from Wallace, that they could arrest us if we did not do what they said. I told them I heard what the judge had to say on that question, and I did not pay any attention to Mr. Wallace.

Part of testimony of J. E. Jones, (printed record, page 587:)

Question. Were there any persons that came there to vote and went away, and did not vote at that poll?
 Answer. Some Democrats went off.
 Q. Do you know them?
 A. Yes, sir; Rev. W. J. H. Worth was one, Johnnie Weeks, J. C. Stoutenmeyer, and J. C. Keller; those to my knowledge; I don't recollect any more right now.
 Q. Did you hear any firing of guns there at all?
 A. Yes, sir; I did.
 Q. A large number?
 A. Between fifty and one hundred, may be over, pistols and guns.
 Q. What time were they fired?
 A. I suppose about a quarter of an hour after they got through counting the votes.
 Q. About the time the votes were counted, and at the end of the count, were there many Democrats there, or only a few?
 A. Very few.
 Q. A large number of Republican voters?
 A. Yes, sir.

FORT MOTTE PRECINCT.

Part of testimony of James A. Peterkin, (printed record, page 590:)

Question. Were you present at the general election on the 2d of November last, at Fort Motte polling precinct?
 Answer. Yes, sir.
 Q. Were there any persons there claiming to be United States deputy marshals?
 A. Yes, sir.
 Q. Who were they?
 A. A colored man by the name of Joe Young.
 Q. You know his politics; whether he is a Democrat or Republican?

A. He claimed to be a Republican.
 Q. What did he do at the poll—what position did he take?
 A. He stood outside the door, and as the Republican voters came up, he caused them to open their votes, that is, the ballots, and show them to him before they put them in the box.
 Q. Did he do that to the white voters or colored voters?
 A. Colored voters only.
 Q. Did he require all colored men that came to vote to show their tickets?
 A. Yes, sir.
 Q. Was there a large crowd of colored men about him at the poll?
 A. They staid right around the poll; the entrance was entirely surrounded by colored men.
 Q. Did any of them take any part in compelling colored voters to vote open tickets?
 A. Yes, sir; a good many of them there had an interest in that; an old man named Sam. Duncan, Dick Duncan's father, and several others; I did not know all of them.
 Q. Did they make any exclamations when the voters came up with their ballots closed?
 A. They told them to open them, and turn them around to this marshal so he could see them.
 Q. These negroes would tell them?
 A. Yes, sir; when one came up with his vote closed.
 Q. What position did you occupy at the poll that day?
 A. I was a manager.
 Q. Did you do or say anything to Young in relation to this conduct of his?
 A. I told him it was illegal.
 Q. What did he say about it?
 A. He said it was the instructions from Mr. Mackey, and that he had to carry them out; I told him the box would be thrown out on account of it.
 Q. What did he then say to you?
 A. That Mr. Mackey would have to be responsible for it, not him.
 Q. Did he express any opinion as to the legality or illegality of that mode of voting?
 A. When I told him, he said he thought it was illegal and ought not to have been done.
 Q. Did he continue to do it nevertheless?
 A. Yes, sir; he said it was his instructions and he had to go by it.

Recross-examination by E. W. M. Mackey, contestant:

Q. You say you know some colored men who wanted to vote the Democratic ticket, but were prevented from doing so because of the feeling you describe?
 A. Yes, sir.
 Q. Do you know more than one instance of that kind?
 A. Yes, sir.
 Q. Can you give the names of any colored men who wanted to vote the Democratic ticket and were prevented from doing so on account of this feeling?
 A. Yes, sir.
 Q. Will you give their names?
 A. If it was actually necessary I would possibly do it, but I don't want to do it.
 Q. In my opinion it is absolutely necessary.
 A. Yes; and you would warn the negroes in my neighborhood, and they would run them off, and that is why I won't give it.

Q. Did not some colored men vote the Democratic ticket at your poll?
 A. Yes, sir.
 Q. Have you heard of any of those who did vote it being interfered with by the other colored people?
 A. Yes, sir.
 Q. In what way?
 A. I heard of one that was met on the road and whipped before he got home.

Part of testimony of Thomas K. Legaré, (printed record, page 594:)

Question. Do you know the state of feeling among the colored people—whether it was such as would countenance voting the Democratic ticket if they knew it?
 Answer. The feeling against any colored Democrat was very bitter. There were quite a number of colored men that wished to vote the Democratic ticket. It was thought this making them vote their ticket open was done to keep them from doing so. A few days before the election several colored men came to me and said they wished to vote the Democratic ticket but were afraid to do so, because it would be at the risk of all they were worth; that they would be ostracized by their families, the church, and most every colored man, and would have no peace of their life. One went on to state that he intended to vote it anyhow; but I advised them not to do so at such a risk as that. I told them they better not risk that. One of those same men voted the Republican ticket who told me a few days before he would vote the Democratic ticket.

Q. You say it is a very unpopular thing for a colored man to vote the Democratic ticket?
 A. Yes, sir; it is unpopular among the negroes.
 Q. Is it not equally as unpopular among the white people for a white man to vote the Republican ticket?
 A. No, sir; a man could be respected who voted for the national Republican ticket, but not if he voted the State and county ticket.

BOOKHART'S PRECINCT.

Part of testimony of O. L. Strock, (printed record, pages 643, 644, 645:)

Question. Were there any deputy United States marshals there?
 Answer. There were four that claimed to be United States marshals; I think there were four.
 Q. Who were they?
 A. Samuel Lewis, William Green, Pell Pauling, Shadrick Jamison, sr.
 Q. Who was the Republican supervisor?
 A. George E. Hart.
 Q. What was the conduct of these marshals and supervisors during the day?
 A. The conduct of these marshals, in my judgment, was very overbearing. They acted, I thought, in a very ungentlemanly manner, a good many of them, and they were bolstered up by a big crowd outside.

Q. Did they have anything to say to the managers about the counting?
 A. Yes, sir; they had more to say than the managers.
 Q. In what way?
 A. First they contended that George E. Hart should attend to everything.
 Q. That was these marshals?
 A. Yes, sir; during the count there happened to be several tickets that were folded up separately and slipped inside in the box; they happened to be Democratic tickets; these marshals contended these tickets should be thrown out and not counted; the managers after talking awhile saw it was best to throw them away.
 Q. Did they say why?
 A. The reasons were clear; there was a big crowd around the house hallooing "The box is ours," and they thought it best to throw them out.

Q. How many tickets were thrown out?
 A. Three; after that two Republican tickets were folded in the same way and slipped in each other, and they contended that those should be counted.
 Q. Were they counted?
 A. They were; about that time the Republican supervisors said to these pretended marshals, "Draw to the box, boys."
 Q. About what time was that?
 A. About the time these Republican tickets were counted; they drew up there and pushed one of the managers away, and he could not see the box at all unless he looked over their shoulders.
 Q. What manager was that?
 A. Mr. J. K. Irick, I think.
 Q. Were there any other instances you can remember now of interference by the marshals?
 A. Not until the votes were counted and the box closed.
 Q. What transpired then?
 A. The votes were counted and the box sealed up, and the question arose among the managers who should take the box up to Orangeburgh, and George Hart said he would take the box; the managers said one of them should take it; the managers thought, hearing the hurrahs made outside, that it was best to give the box up. (Objected to by counsel for contestant upon the ground of hearsay.)
 Q. Who were the marshals then in the room?
 A. Pell Pauling and William Grant; I think those were the two.
 Q. Did they have anything to say about who should take the box?
 A. They said George Hart was the man they thought should take it.
 Q. What became of the box then?
 A. It was delivered in George Hart's hands; he carried it from the house; I don't know what he did with it after that.
 Q. Why did the managers give it up? (Objected to by counsel for contestant.)
 A. They gave it up because if the Democratic managers had carried that box they would have been mobbed on the road; that was their belief.
 Q. How many colored men you suppose were about the poll?
 A. When the box was delivered?
 Q. Yes.
 A. Not less than two hundred.
 Q. How many white men?
 A. About fifteen.
 Q. What was the conduct of this crowd—these colored men?
 A. It was not becoming at all; there was a good many armed, and they fired off several volleys as the box was taken from the house, using all kind of language which was not becoming in any crowd to use.
 Q. Did any one accompany Hart?
 A. When he left the house with the box the two marshals accompanied him.

Part of testimony of Abial Lathrop, attorney for E. W. M. Mackey, (printed record, pages 265, 266, 269, 270:—)

Question. Have you in your possession the box used at Bookhardt's voting precinct in this county; and, if so, state how it came into your possession?
 Answer. I have in my possession what I suppose is the box used at that poll. I received the box from George E. Hart, one of the supervisors of the Bookhardt's poll. He put in my possession the box which I now have here, and which he told me was the Bookhardt box.
 Q. You say that box was delivered to you by George E. Hart, one of the supervisors at Bookhardt's poll.
 A. Yes, sir.
 Q. Did you act as one of the counsel for the Republican candidates before the board of county canvassers at the late election?
 A. I did for some of them.
 Q. Were you present during the canvass of the votes by the county canvassers?
 A. Yes, sir.
 Q. During the canvass of the vote of the county, was Bookhardt's poll called?
 A. I think the name of Bookhardt's was called. The chairman had a list of the different polls in the county, and before he began he allowed us to copy the order in which the boxes would be called. My impression is that Bookhardt's was on that list, and when it was called the commissioner who had charge of the boxes said he had none from Bookhardt's poll.
 Q. You were present then when that occurred?
 A. Yes, sir; that is what I think occurred.
 Q. Did you have this box, which you have opened this evening, in your possession at that time?
 A. I did.
 Q. You were there representing the Republican candidates?
 A. Yes, sir; but I did not have the box there.
 Q. Has it been on any other travels?
 A. I took it to Columbia when I went to the meeting of the State board of canvassers.
 Q. Now state where you had it in Columbia?
 A. I had it in my room at the hotel, and I had it at the state-house in the secretary of state's office, and I had it around with me at different places in Columbia.
 Q. Name the other places where you had it.
 A. I don't recollect; I did not carry it everywhere where I went; I had previously taken it out of the safe and sealed it with a private seal so I could tell if anybody tampered with it; when I took it to Columbia I carried it myself from the cars and went to the hotel. After registering my name I carried the box to the state-house with me. After that I carried it back to the hotel and left the box there and went to dinner.
 Q. Did you take the box to dinner with you?
 A. No, sir; I did not; I left it in my room when I went to dinner.
 Q. Did you bring it back to Orangeburgh with you?
 A. I did.
 Q. Did the question of the Bookhardt's poll come up before the State board of canvassers?
 A. I don't recollect now whether it did or not.
 Q. What counsel represented the Republicans before the State board of canvassers?
 A. Mr. Taft, Mr. Elliott, and myself.
 Q. Didn't you go before the State board of canvassers with testimony in relation to the different polls?
 A. Yes, sir.
 Q. Was not Bookhardt's one?
 A. I don't think so.
 Q. You made no question before the State board of canvassers as to Bookhardt's poll?
 A. I don't think there was any such question before the board.
 Q. You did not make any question about Bookhardt's poll?
 A. I don't recollect whether anything was mentioned about the Bookhardt's poll; it might have been, or might not have been. I don't remember whether we had any affidavits in regard to it or not.

Q. But you had the box there?
 A. Yes, sir.
 Q. Did you have an opportunity of offering testimony before the State board of canvassers?
 A. Yes, sir.
 Q. Didn't they give you ample opportunity of putting in testimony?
 A. We had time to put in the testimony we had, or which we thought they would be likely to take cognizance of.
 Q. You had this identical box there?
 A. Yes, sir.
 Q. Did you offer it?
 A. No, sir.
 Q. Carried it to the room?
 A. Yes, sir.
 Q. And brought it back on the cars from Columbia?
 A. Yes, sir; I brought it back.

Part of testimony of F. M. Wannamaker, (printed record, page 607:—)

Question. When the votes of the county were canvassed by the board of canvassers where was the canvass held?
 Answer. In the court-house of Orangeburgh, in the presence of a large number of persons, publicly.
 Q. Were both parties—the Republican and the Democratic parties—represented by counsel?
 A. Yes, sir; both parties were represented by counsel.
 Q. Do you remember what occurred, whether in the call of precincts Bookhardt's precinct was called?
 A. I remember when Bookhardt's precinct was called no box was found; I although subsequently learned from Mr. Lathrop that it was in his possession; it was not tendered to the board of canvassers.

[Memorandum: The foregoing are precincts in the county of Orangeburgh. The testimony concerning the precincts in Charleston County had not been completed when Mr. O'Connor died, and has never been completed.]

The member from Pennsylvania talks about intimidation of Democrats by Republicans and invokes the shade of Calhoun! I say to you that there are colored Democrats in South Carolina, and I say to you that the conduct at these polls rendered it dangerous to their lives, to their little cabins, and to their persons on the day of the election to cast their honest votes.

Now, Mr. Speaker, a little as to the election in South Carolina. It has been the policy of the Democratic party ever since 1876 (for we claim credit for some little portion of the intelligence of this country) to gain to their ranks accessions from the colored people of the South. In what way have we done it? I have not the time to give you a very elaborate statement of what we have done, but will cite a few facts by way of illustration.

We have said to the colored people of South Carolina: "Form your colored Democratic clubs; send your delegates to our county conventions; do so, and we will give you representation on our tickets." In that way we have a colored Democracy, not as numerous as the colored Republicans, but vastly more intelligent. [Derisive laughter on the Republican side.] We have a Democracy of colored people embracing the property-holders among them and as staunch Democrats as there are anywhere else, and I say to you and to that side of the House that when you gave the colored man the ballot you then by the law of nature made the white man of the South, who is his friend, his leader, and those ballots we will control.

Mr. Speaker, we control them not by force, but by the honest legislation of South Carolina. We control them by their personal interests, which are identical with those of our white people. From the three counties which compose my district in that State there are four colored Democratic members of the Legislature in the South Carolina house of representatives, elected by the joint white and colored Democratic votes of that district.

In my county there are three county commissioners; one of them is a colored Democrat. In my county there are fifty-two school districts, and in every one of these school districts there are three school trustees, two of them white and one colored; and there are two schools, one white and one colored school; and the property-holders of South Carolina—the white people of that State, the Democratic party in South Carolina, in its Legislature—though suffering under the wrongs resulting from Republican misrule, when they got the control of the government decided by a two-thirds vote that the colored man should be educated. They determined that he should have every advantage of education, although we had to pay the taxes. We believe that intelligence is the very foundation and basis of popular liberty; and with our humble means, impoverished by disaster, our property gone, we are doing with those means the best that we can; and that action and the course we are taking has created the colored Democratic party in South Carolina.

I will state another circumstance. In my district, in the city of Charleston, there is one journal, and only one, published by the colored people as their special organ, and edited by an educated colored man, and that journal, independent in its politics, possibly in the Presidential election advocating the Republican Presidential candidates, in its columns advocates the Democratic State, Congressional, and local tickets.

Now, Mr. Speaker, I say that secrecy is the essence of the ballot; and that when a conspiracy is formed against the laws of the United States and against the laws of South Carolina, a conspiracy to compel every man to show his vote, not for the purpose of preventing double voting, (because this testimony, tampered with as it is, shows numerous boxes where they claim this open voting took place with Republican double tickets in them when the box was

opened, as is testified sometimes by Republican witnesses,) not for that purpose, but because the colored men could thus be "spotted" for intimidation, for ostracism, for personal violence, who would dare to vote the Democratic ticket in some barbarous sections. When that is the case, I say that I stand here by the last voice of the people of that district; and standing here, feeling that in the action which I anticipate this evening a gross wrong is to be inflicted upon my people, I have the right to say that I have not had the opportunity afforded me to show this state of facts which every litigant is afforded by the law. And in this high tribunal, this tribunal which, under the Constitution, is the judge in this case; this tribunal which ought, of all others, to act according to the rules of law and precedent—I say that in this case—is preordained a precedent which future Congresses will disclaim, as this Congress may well look back with shame upon some of the partisan decisions of the past.

I had thought, Mr. Speaker, that day was over. I know there have been some issues that were unpleasant, but I had thought that they were dead. I know that I represent a people who are as loyal to that flag which waves over the Speaker's desk as any member upon this floor; a people who would maintain the decision rendered by the arbitrament of arms as fairly and in as good faith as if it had been rendered in a court; and I say for that people now, that this action you have determined upon will be a wrong, but that this wrong will not affect that feeling, and that I speak their voice when I say that we still claim that this is our common country, and that we are a part of it, and as much a part of it as anybody in this broad land. [Applause.]

I have nothing to ask of grace or favor. I have only asked what I believed to be right; and I expect it to be denied. I say that my constituency are entitled to a proper representation here. And if this House, under its high powers, shall grant this seat to the contestant and permit them to be misrepresented by one whose record of the past comes up and culminates now in forgery, it is the majority of this House which assumes the responsibility, and to its behest we have to bow. [Applause on the Democratic side.]

Improvement of Mississippi River.

SPEECH

OF

HON. THOMAS M. GUNTER,

OF ARKANSAS,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, June 7, 1882.

On the bill (H. R. No. 5393) making an appropriation for the improvement of the navigation and commerce of the Mississippi River in accordance with the recommendations, plans, specifications, and estimates of the Mississippi River commission.

The bill is as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the following sums of money be, and they are hereby, appropriated, to be paid out of any money in the Treasury not otherwise appropriated, to be expended by and under the direction of the Secretary of War, for the improvement of the navigation and commerce of the Mississippi River:

For the construction, repair, completion, and preservation of certain works on the Mississippi River between the mouth of the Ohio River and the head of the passes of the Mississippi River, in accordance with the recommendations, plans, specifications, and estimates of the Mississippi River commission, \$4,613,000.

For improving the Mississippi River between the mouths of the Ohio River and the Illinois River, in Illinois and Missouri, (continuing improvements,) \$1,000,000.

For improving the Mississippi River between the mouth of the Illinois River and Des Moines Rapids, in Illinois and Missouri, (continuing improvements,) \$500,000.

For improving the Mississippi River between Des Moines Rapids and Saint Paul, in Minnesota, Iowa, Missouri, Illinois, and Wisconsin, (continuing improvements,) \$750,000.

Amount appropriated, \$6,863,000.

Mr. GUNTER said:

Mr. SPEAKER: Questions of grave importance have been discussed in either branch of Congress for many days, questions affecting varied interests and demanding and receiving grave consideration; such, for instance, as that to determine whether a distinguished citizen of the Republic shall be pensioned for life at the rate of \$13,500 per annum, or be allowed to exist on the private income of half a million dollars; and whether we should enter the households of a certain class of people in the Territories and prescribe the number and class of inmates; and whether we should deny to the citizens of a nation with which we are on friendly terms the privilege of habitation in our country. All these have been discussed, and I have not taken any part in the debates, because I did not care to do so; did not feel the necessity of adding any words of mine to the wisdom evolved by those who were so earnestly engaged in these matters.

But now, Mr. Speaker, there is a question before the House, before the country, which my work-a-day mind can understand; one in which of the fifty million inhabitants of this country more than

twenty-five millions are directly interested; one which is not for to-day alone, but for all time; one which, when properly viewed, is a question whether we shall redeem an empire, before the coming splendors of which all that is past, either in history or tradition, is as naught; or whether through error upon our part we shall delay, instead of hasten the day, when the Mississippi Valley shall be the center of the world's power and riches.

The bill under consideration is "for the improvement of the navigation of the Mississippi River, and to prevent destructive floods." How vast, Mr. Speaker, are the interests involved when compared with those to which I have alluded. Those only affected certain confined localities or specified individuals, but these affect not only the twenty-five million people who live in the watershed of the Mississippi but all, all the people, not of this country alone but of the civilized world.

Mr. Speaker, let us imagine ourselves advanced to that period of time when the air will be navigated as the water is, and seating ourselves in the palace-car of an air-train, let us start from the mouth of the great river, follow it to its source, and report what we see.

At the mouth and thence for three hundred miles, to the entrance of Red River, upon our northward trip, the elevation we take will have to be considerable, and the telescopes we use powerful, for we must look over a country averaging over one hundred miles in width. What do we see? Below us lies thirty thousand square miles, nineteen million two hundred thousand acres of the richest alluvial land in the world. Through it rolls the mighty flood of the Mississippi River. Everywhere the silver threads mark where bayous, lagoons, and streams, connecting with each other, with the great Father of Waters, and with the Gulf of Mexico, present the most perfect system, if utilized, of water communication that could be devised by man—yes, Mr. Speaker, more perfect than could be devised by man, for it is the work of the great Creator of the universe.

An almost tropical sun warms the soil, when air and light have been let in upon it and man has made his habitation, making it bring forth the most valuable of agricultural products. Sugar, cotton, rice, fruits, and vegetables without number, incomparable in quality and unstinted in yield, burden the earth. But, sir, only a fraction and a very small fraction of this thirty thousand miles, of these millions of acres, have been reclaimed from the virgin forest. For every acre that shows the tillage of man there are ten that are still given up to the stately live oak, the mighty cypress, or the unsightly gum tree. Why? Why is it that these lands which repay every year more than the cost of the land and the cultivation are left untouched? Why is it that this virginal forest remains, when the genial sun, the air, and the rich soil all proclaim to the children of men, "Here is the home for you. Here you can easily acquire the necessities of life and provide for your old age a time of ease and rest." Ah, sir, it is because the mighty flood of waters that rolls down from lake and mountain to the Gulf has not been controlled, and even those who have rescued homes from the wilderness have annually to fight the floods.

But, sir, to pass on in our voyage for another three hundred miles, to the southern border of the State which I have the honor in part to represent. Over this distance we find an average width of seventy miles within the valley of lands as rich as those already viewed, but with somewhat different characteristics of soil and climate. The sun does not shine so warmly and the vegetation changes; the sugarcane will not ripen, because the breezes that come from the frozen North bring early frosts and congeal the unripe juice. But here the cotton grows, and with it corn, the former more luxuriantly than in its native home upon the banks of the Indus, and the latter as grandly as when the first grain was planted for the benefit of Hiawatha. Here are 21,000 square miles—13,500,000 acres of land, "rich as the sun shines on," with only the same proportion and for the same reasons in cultivation.

But let us hasten onward. From the southern line of Arkansas, to Cairo, Illinois, is six hundred miles, and the average width of the land affected by the overflow is about forty miles, that is 24,000 square miles, 15,500,000 acres. This land is no less rich than that of the two preceding sections spoken of. But again the soil and climate changes. Cotton still grows as luxuriantly as in the second space mentioned, until we near the northern boundary; corn even better than farther south, while wheat, oats, and other small grains are added to the products.

I shall not attempt at present to follow the river farther north. I have reached the line which some years ago, in company with some friends of mine, I attempted to cross, and having failed, out of deference to the feelings of the gentlemen who then objected to my crossing, and many of whom I see here, I shall pause at Cairo for the present.

But what have we seen? A vast delta or valley twelve hundred miles long, varying in width from forty to one hundred miles, containing over 75,000 square miles—over 50,000,000 acres—of rich, alluvial soil, not one-tenth of which is in cultivation, and which, if it were reclaimed from the wasting floods, would produce wheat, oats, corn, cotton, sugar, and rice enough to feed the world.

I do not conceive, Mr. Speaker, that there is much difference of opinion as to the necessity of improving this great channel of commerce, this grand highway which was constructed by the Almighty, this mighty inland sea. There may be a few men, both in and

out of Congress, but there are very few, (and that is so much the better,) who dispute the power of Congress to enter upon this work; but if there are any such left they are in the condition of the Irishman's chicken. He broke an egg and took the contents in his mouth without looking at it; as he closed his mouth the "peep" of a chicken was heard. "You spake too late," said he, as he swallowed the morsel. And so with the few who oppose the improvement of the Mississippi River; they "spake too late." Congress has fully committed itself, and the people have indorsed it in doing so, to the policy of spending *whatever money may be needed, no matter how great the sum*, to redeem the valley of the Mississippi River from overflow, and to make it a highway of commerce that can be used at all times. Spasmodic efforts had been made before, but in June, 1879, when the act was passed "to provide for the appointment of a 'Mississippi River commission' for the improvement of said river from the head of the passes, near its mouth, to the headwaters," Congress definitely declared its future intentions to be, "that a settled plan of improvement should be adopted and carried out."

In pursuance of that act, the "Mississippi River commission" has been appointed, has entered upon the discharge of its duties; entered upon them intelligently, as was to be expected from the class of men selected.

General Gilmore, president of the commission, in his report dated February 17, 1880, (Ex. Doc. 58, Forty-sixth Congress, second session,) places the duties of the commission under three heads, thus:

The work assigned to the commission was—

First. To direct and complete such surveys of the Mississippi River between the head of the passes, near its mouth and its headwaters as were then in progress; and to make such additional surveys and examinations of said river and its tributaries as might by it be deemed necessary.

Second. To take into consideration and mature such plan or plans as will correct, permanently locate, and deepen the channel and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof; prevent destructive floods and promote and facilitate commerce and the postal service; and with such plans to prepare and submit estimates of the cost of executing the work.

Third. To report specifically upon the practicability, feasibility, and probable cost of the plans known as the jetty system, the levee system, and the outlet system.

Having defined its work as laid down in the creative act, the commission proceeded to perform its first duties. The examinations and surveys, directed under the first subdivision, were simply to enable the commission to proceed upon proper data "to mature such plan or plans as will correct, permanently locate, and deepen the channel," &c., and then to submit estimates of the cost of executing the "plan or plans" selected. All this has been done; the plans have been matured, which, in the opinion of the commission, will do all that the act creating that commission contemplated.

What did we expect, what did we desire when we made the law creating the commission? Let us revert to the law and see. Section 4 says:

It shall be the duty of said commission to take into consideration and mature such plan or plans and estimates as will correct, permanently locate, and deepen the channel and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof; prevent destructive floods; promote and facilitate commerce, trade, and the postal service.

It was "to take into consideration and mature such plan or plans;" that was all. As would do what? What we, the representatives of the people of the United States, wanted. Did we tell the commission? Very plainly. We wanted "to correct, permanently locate, and deepen the channel" of the Mississippi River. The commission has told us how, in its judgment, that should be done, and I entirely and heartily agree with and indorse the plan of the commission. But that was not all it was to do. It was to "protect the banks of the Mississippi River." If it can—and I believe it can, under the plan proposed—"correct, permanently locate, and deepen the channel," the banks would be "protected," so that the one direction includes the other, and the plan proposed is sufficient.

To "improve and give safety and ease to the navigation" of the Mississippi River is the next thing we desired, and would be a logical sequence of the first, for if we "correct, permanently locate, and deepen the channel" of the river, at the same time "protecting its banks," we certainly "improve and give safety and ease to the navigation." The one follows the other as certainly as night follows day; as death follows life. So, too, we desired such plans as would "promote and facilitate commerce, trade, and the postal service." But what I said about giving "ease and safety to navigation" is equally applicable to this clause. If we "correct, permanently locate, and deepen the channel" and "protect the banks" of the Mississippi River, we at once "facilitate commerce, trade, and the postal service," because we give "safety and ease to the navigation" of the river. So that what we wanted the commission to do was to "mature such plan or plans as will correct, permanently locate, and deepen the channel and protect the banks of the Mississippi River." That is all. The other things of which I have spoken in the law are simply the results we desired from the work that was to be done. They were surplusage, so far as anything the commission was to do. They were simply instructions to show to the commission why we wanted the channel "deepened and permanently located and the banks protected."

Mr. Speaker, we give this commission a most important work. How important it is I shall not now attempt to show, except to say

that every producer of grain, coal, iron, wool, furniture, of anything in fact from Pittsburgh, Pennsylvania, clear across the great States of Ohio, Indiana, Illinois, Michigan, Minnesota, Wisconsin, Iowa, Nebraska, Missouri, Kansas, West Virginia, Kentucky, Tennessee, Arkansas, and the territory of the Northwest, has an immediate and vital interest in securing "safety and ease in the navigation of the Mississippi River," and that can only be done by doing what we, in the act I have quoted, directed this commission to "consider and mature plans" for doing, that is, "to permanently locate and deepen the channel" and "protect the banks of the river."

Every producer in these sections has, as I said, a vital interest in this; every "worker in brass and iron," like Tubal Cain of old; every shepherd like Abel; every husbandman like Adam; every man, whether he is one of those who "earns his bread by the sweat of his brow" or is of those who have accumulated labor in the shape of capital, all are alike interested, because with "safety and ease" in the navigation of the Mississippi River, the products of these sections, be they what they may or in what quantities they may, can be transported more cheaply to the consumer, 50 per cent. more cheaply, and the producer will receive, not all the difference, but a fair and just proportion of it, and he will receive it in more ways than one; he will receive it in increased prices, for prices will be increased, and also in the decreased prices he will have to pay for what is brought from other sections to him.

But it is not only the people of the section I have named that will reap the benefit of "safety and ease" in the navigation of the Mississippi River that is to be produced by giving it a "deepened and permanently located channel and protected banks." The dwellers in the Southern and Gulf States; on the Atlantic seaboard, from Florida to Maine; the people of the great Middle States, through which pass the lines of railways from the West to the East; the toilers in the cities; the workmen in the factories will all be benefited. They will receive some of the benefits that accrue from cheapened transportation; what they have to buy will be cheaper; what they have to sell will bring more, because the cost of carrying will be lessened each way, for though lines of railway may combine to keep up prices, they cannot combine with the Mississippi River nor against it, and their rates will have to be lowered.

So then, Mr. Speaker, I believe, and my belief is founded upon reason and logic, that every one of the fifty million people of this country will be benefited by the securing of "safety and ease" in the navigation of the Mississippi River, with the possible exception of the owners of some railroad stocks.

But, sir, when this commission was constituted we directed it to do something else besides "correct, permanently locate, deepen the channel," and "protect the banks of the Mississippi River," that "safety and ease" should be given "to the navigation thereof." Yes, sir, they had another and, I honestly believe, a still more important duty to perform, and that was "to prevent destructive floods." I say it is more important, and it is undoubtedly more difficult. In that grand epic poem, the grandest in any language or of any time, the book of Job, we find the question "Who hath divided a water-course for the overflowing of water," but even more than that, is what the Mississippi River commission was called upon to do, when we directed it to "consider and mature such plan or plans as will" "prevent destructive floods."

"Who hath divided a water-course for the overflowing of waters," and who hath confined a mighty flood such as that which flows down the valley of the Mississippi? To "dam the Nile with bulrushes" would seem to be easy in comparison with this work we have directed our commission to "mature" plans for, and yet I believe it can accomplish that work, always provided we give it the necessary aid. I believe it can be done, because I am not prepared to say that human intelligence is bounded by any limit except that of money, and I am prepared to say that he who would deny money for the purpose of accomplishing the work which this commission was created for is unfit to be a representative of the American people.

I have carefully examined the reports of the commission and the plans recommended. General Gilmore says in his report, (page 14:)

While it is not claimed that levees in themselves are necessary as a means of securing ultimately a deep channel for navigation, it is believed that the repair and maintenance of the extensive lines already existing will hasten the work of channel improvement through the increased scour and depth of river-bed which they would produce during the high-river stages. They are regarded as a desirable, though not a necessary, adjunct in the general system of improvement submitted.

It is obvious that levees are, upon a large portion of the river, essential to prevent destruction to life and property by overflow. They give safety and ease to navigation and promote and facilitate commerce and trade by establishing banks or landing places above the reach of floods upon which produce can be placed while awaiting shipment, and where steamboats and other river craft can land in times of high water.

In a restricted sense, as auxiliary to a plan of channel improvement only, the construction and maintenance of a levee system is not demanded. But in a larger sense, as embracing not only beneficial effects upon the channel but as a protection against destructive floods, a levee system is essential; and such system also promotes and facilitates commerce, trade, and the postal service.

With that statement I entirely agree; it is based upon sound reasoning, but I cannot fully indorse what General Gilmore says anterior to this in relation to outlets, and I think further, that his own argument, his own statement of facts, on pages 9 and 10, as to the Atchafalaya, refute the conclusions at which he arrives. I do not claim to be a civil engineer, or to have a scientific knowledge which would enable me to confute what General Gilmore says, but I think

facts—facts stated by him as well as by others—are more powerful than theories, and I cannot therefore indorse the commission when it declares that "outlets" are not and will not be useful in disposing of the mighty floods, such as that which is now devastating the valley, when they come upon it. The plan for the improvement of the navigation, for deepening the channel and permanently locating it, I consider good. The report says, (pages 16 and 17:)

It would seem, therefore, that the plan of improvement must comprise as its essential features the contraction of the water-way of the river to a comparatively uniform width, and the protection of caving banks, and this is presumed to be the plan referred to in the act as the "jetty system." It is known, from observation of the river below Cairo, not only that shoals and bars, producing insufficient depth and bad navigation, are always accompanied by a low-water width exceeding three thousand feet, but that wherever the river does not exceed that width there is a good channel. In other words, bad navigation invariably accompanies a wide low-river water-way, and good navigation a narrow one.

The work to be done, therefore, is to scour out and maintain a channel through the shoals and bars existing in those portions of the river where the width is excessive, and to build up new banks and develop new shore lines, so as to establish as far as practicable the requisite conditions of uniform velocity for all stages of the river.

It is believed that this improvement can be accomplished below Cairo by contracting the low-water channel way to an approximately uniform width of about three thousand feet for the purpose of scouring out a channel through the shoals and bars, and by causing, through the action of appropriate works constructed at suitable localities, the deposition of sand and other earthy materials transported by the water upon the dry bars and other portions of the present bed not embraced within the limits of the proposed low-water channel. The ultimate effect sought to be produced by such deposits is a comparative uniformity in the width of the high-water channel of the river.

It is believed that the works estimated for in this report will create and establish a depth of at least ten feet at extreme low stages of the river over all the bars below Cairo where they are located.

It is the opinion of this commission that, as a general rule, the channel should be fixed and maintained in its present location; and that no attempt should be made to straighten the river or to shorten it by cut-offs.

So let it be. I am satisfied with that so far as it goes, and care not what it costs. But something else is wanted, and that is a reduction of the "flood level." Two members of the commission, one of them now a Senator of the United States, and the other an accomplished engineer, differed with the majority, as I have differed with them, as to the advisability of outlets, agreeing substantially to the necessity for levees, and the narrowing of the channels to produce a greater depth at low water, and to "permanently locate" it. General Comstock and Senator HARRISON say, (page 22, minority report:)

A reduction of the flood-level is very desirable, but where on other rivers this has been effected, cut-offs have usually played an essential part. For this reason we are not prepared to absolutely reject their use, after the banks of the river have been thoroughly protected for considerable distances above and below the sites where they are about to occur.

It is undisputed that the "flood-level" is now being lowered by the cut-off, (outlet if you please,) of the Atchafalaya, through which an immense body of water from the Mississippi is now pouring, reaching the Gulf by a route three hundred miles shorter than that by the river, and over an incline three times as great to the mile. This cut-off, outlet, or whatever you may choose to call it, is giving relief below where it opens from the river from a "destructive flood," and one such fact is worth all the theories evolved by the metaphysicians. If that "outlet," carrying 10 or 20 per cent. of the flood tide, is relieving the country below it from the utter destruction that has come upon that above it, I would to God that it left the river five hundred miles above where it does and carried off double the amount it does, for then there would be no overflow, and we would not be listening to the cries of distress that come to us from every quarter of the great valley between Cairo and the head of the Atchafalaya. But some one will say, "The floods you send off through your outlets will overflow their banks and create the distress and damage in that section from which you secure another section."

Not so, Mr. Speaker, one million cubic feet of water each second of recorded time flows past New Orleans, within the banks of the Mississippi River. What power can restrain this within bounds? Divide into a number of small streams and it would be easy. The water flowing through the Atchafalaya, with its swifter current, can be easily controlled by levees, when it would be a physical impossibility to restrain that which flows through the Mississippi. That this result—that is the deepening of the channel and the control of the water—can be obtained in small rivers is proven by the reports on Red River, and on the Atchafalaya, contained in the supplementary report of the commission to this Congress. So that the only real objection that could be made to the outlet system in connection with the levees and the narrowing of the channel proves to be no objection. "Divide and conquer" has been the motto of the world. If we cannot conquer this flood of waters, if we cannot bind in bonds that cannot be broken—cannot build a prison-house strong enough to hold it, then let us divide it so that we can conquer.

Mr. Speaker, I do not believe that all the knowledge of the world is confined to that very estimable body of men known as army and civil engineers. They have a technical education, and most of them travel in the ruts made for them by former engineers, very few, not of engineers alone, but of any class of men who are technically educated, being able to break the trammels which necessarily bind the man who receives a technical education. Nor do I conceive that an education at West Point, or as a civil engineer, necessarily makes

a man competent to tell what should be done for the prevention of "destructive floods" in the Mississippi River. There are no precedents to guide us, for there is no other such river as the Mississippi. Experience on the river—a knowledge acquired by contact with it—its previous history since the settlement, all these should be considered by us, as well as what the commission says, when we endeavor to prevent "destructive floods."

Congress did not surrender its right to consider and act when it created the commission and directed it to "consider and mature such plan or plans" as would, if carried out, effect the desired end. It asked, it directed this creature of its own creation to "consider and mature" and to "submit" its "plan or plans" for approval. For my part I am ready, as I said before, to approve the plan submitted for the purpose of correcting, permanently locating, deepening the channel, and protecting the banks of the river, so that safety and ease would be given to the navigation. But to prevent "destructive floods," I want them to enlarge their ideas; I want to see the outlet system tried. General Gilmore, in his report, more than once speaks of the proposed works as "an experiment." Let the commission add another experiment and test the theory of outlets, if that can be called a theory which has been of benefit in past years, and which is now doing vast good.

I spoke of the necessity that existed of consulting on this subject men of experience on the river, men whose knowledge came from personal observation. Captain T. P. Leathers has lived on the Mississippi River more years than most of us have seen, and he said on the 7th of this month, at Vicksburg, in the center of this great sea of waters now surging down in the Mississippi Valley:

If the Government does not take immediate steps toward relieving the valley, or, in other words, to provide substantially for the complete riddance of this superabundance of water by an effectual outlet system, the inhabitants of this immense tract of the richest lands in the world will be compelled to abandon their own homes and flee to the hills for protection. It is a plain proposition, and I assert it without fear of successful contradiction, that the river is higher at the present time below New Orleans than ever known before, and as the water cannot be carried away in its regular channel, (the mouth below having been impeded by artificial methods,) it is bound to have recourse to other means than those furnished by nature for its exit to the Gulf, and unless there occur several serious breaks in the levees above New Orleans, that city will experience a most disastrous overflow this year. It is a most notorious fact that the Mississippi River has never been so sluggish as it is just now, and this also may be accounted for in the obstructions at its mouth. If Lake Borgne is made the outlet, the Father of Waters will need no levees except at extremely low points, and as the present crevasses at Bonnet Carré and Morganza are fast closing up, it will necessitate the river channel in seeking another outflow.

The views of such a man as Captain Leathers should command respectful attention, should be considered carefully, for they are the result of fifty years' observation by a man of sense, whose entire business is upon the river. Captain John Cowdon is another old river man, who has studied the river for years, and who has a wonderful fund of information upon it, a fund which would be more generally drawn upon but for the severity with which Captain Cowdon comments upon the opinions and views of others. He believes that outlets only are needed, not only to prevent "destructive floods" but to "correct, permanently locate, and improve" the banks of the river, and give "safety and ease to the navigation thereof." There are many others who think as he does, and I want to do anything, everything, that might help to prevent "destructive floods" such as that now destroying the country.

I said, Mr. Speaker, that this branch of the commission's work was more important than the other. I think it is. I have endeavored to show the importance of giving "safety and ease" to the navigation and how it would affect all the people of this country. Now, sir, permit me briefly to demonstrate the result that would follow the prevention of "destructive floods." Let us suppose the work to have been done and a generation to have passed away, and enter once more the "air-line railway" that passes from the mouth of the Mississippi River to its headwaters. What do we see? All along the Gulf coast, where now the fish-hawk and the alligator are the only inhabitants, are stately residences and smiling cottages, fields of golden oranges and lemons, of plantains, bananas, and figs, vast areas of waving cane, that will yield enough sugar to supply America and send a large surplus abroad, with sugar-mills converting it; a busy hive, teeming with a dense population, living in health and plenty where now there are but a few scattered dwellers, fighting in the summer and fall the miasma that comes from overflowed lands, and in the winter and spring the overflowing waters that make the miasma.

This is the sight that greets us for the first section of our previous voyage, and then comes the cotton-fields, broad as the alluvial lands wherein the cotton attains such perfection, while the open bolls tell of an abundant yield. We hear the ceaseless whir of the gin, see the fires of the oil-factories and the cotton-presses, the houses of the inhabitants, embowered in vines that yield the richest of wines, surrounded by orchards of luscious peaches. Further on in the third section the cotton covers only a portion of the earth; corn first, and then corn and wheat divide the empire; the orchards have been re-enforced by the apple, while the grape and peach remain. In the broad valley containing its seventy-five thousand square miles reclaimed from the overflow every acre is productive and every acre is made to produce. The value of the timber alone that has been removed from this reclaimed land has ten times over repaid the cost of reclamation,

and now, year after year, for generation after generation, without the intervention of any Shiphers or guano kings, the rich soil returns a hundred fold the care and money that have been bestowed upon it. The mighty river, with its inflowing branches and its outflowing "outlets," glides peacefully along between its restraining walls like a well-broken and harnessed courser, and on its bosom bears the commerce of a world.

Sir, the picture is not overdrawn. The valley of the Mississippi, within the limits of overflow, is the largest body of alluvial land in the world, and it is the richest. It is our heritage to give to future generations, and we must determine whether we will give it to them in a condition to support a population as dense as that of Belgium, or whether we will leave it as it is. That is what we are considering in this bill.

I regret, sir, to see among some members (fortunately only a few) a disposition to oppose granting the sums asked for by the Mississippi River Commission. This opposition comes from more than one reason, or rather pretext. One says, "Too much money is required." Too much cannot be expended on this work.

Mr. Speaker, within the last thirty years the Congress of the United States has given \$100,000,000 for the improvement of rivers and harbors to benefit local trade and commerce. During the same period of time it has given over one hundred and thirty millions of acres of land, valued at over three hundred and fifty millions of dollars, in aid of railroads to give "safety and ease" to travel, and to "facilitate commerce, trade, travel, and the postal service." Here are nearly five hundred millions of dollars voted by Congress for one of the purposes for which this appropriation is asked, and the benefits derived from that sum, compared to those that will arise from this, "giving safety and ease to the navigation of the Mississippi River," are as but a drop of water to an ocean, without considering the benefits that would be gained from the prevention of "destructive floods;" and yet gentlemen talk of "the cost" of these proposed improvements.

Another says, "The plan is not perfect." Neither is anything else conceived by the finite mind of man; but it is the best we have. Still another echoes the growl from the hungry vampires in the lobby, "There is a job in it." So there is, and a grand one—the grandest ever attempted by man—"the job" of reclaiming an empire. I want to be in that "job."

Mr. Speaker, it seems to me that our duty is plain. We directed a commission to examine into and report a plan to improve the navigation of the Mississippi River. It has made its examination and reported its plan, and it asks us for the money—not to be expended by it—to carry out the plan. If we believe that the object desired can be accomplished by the means suggested then we should at once vote the money; for, as I have said before, no question of cost should be permitted to enter into this subject. The Mississippi River must be made navigable at all times, its overflow restrained, and its valley reclaimed, let the cost be what it may. This is a duty we owe to the world.

Jefferson's Granddaughter.

SPEECH

OF

HON. WILLIAM E. ROBINSON,

OF NEW YORK,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, July 5, 1882,

On House bill No. 6304, granting a pension to Septimia Randolph Meikleham, only surviving grandchild of Thomas Jefferson.

Mr. ROBINSON, of New York, said:

Mr. SPEAKER: In an humble cottage, rented at twenty dollars a month, in a secluded part of Georgetown, in this District, lives Septimia Randolph Meikleham, widow of Dr. Meikleham, daughter of Martha Jefferson and only surviving grandchild of Thomas Jefferson, with her three children, depending mostly upon the exertions of a delicate and dutiful daughter for their support. She was born at Monticello, beneath her illustrious grandfather's roof, on the 3d day of January, 1814. She was the seventh daughter, and hence called Septimia, and, I believe, the youngest child but one of Governor Thomas Mann Randolph and Martha Jefferson. They had twelve children, five sons and seven daughters, all born in Jefferson's home at Monticello except Mary Jefferson and Benjamin Franklin, who were born at Edge Hill, and James Madison, who was born at the White House, in the city of Washington, when her mother was the mistress of that establishment.

Thomas Jefferson was the prophet and founder of American republicanism, the father of the University of Virginia, the author of the statute of Virginia for religious freedom, and of the Declaration of American Independence. A few minutes past noon on the 4th of July, 1826, just half a century after the adoption of his immortal

Declaration, he and his great compeer, John Adams, one the second and the other the third President of the United States, of whose independence they had been among the stoutest champions, winged their flight to another world on the same day, in the term of the sixth President, the son of the second, John Quincy Adams, each supposing that the other survived him, leaving the country whose liberties they so largely contributed to establish trebled in population, with all the signers of her independence dead but one, the first gentleman of the world, Charles Carroll of Carrollton, who for six years longer lived to enjoy the homage of the entire country, and then to pass away and follow them to the starry home of the good and great.

Jefferson had five children. His wife was five years younger than he. They were married on the 1st day of January, 1772; he at twenty-nine, she at twenty-four years of age. Ten years after they married, and four months after the birth of their fifth child, she died. No dying wife ever received such attention or was followed to the grave with such anguish from her husband. Their children were:

Martha Jefferson, born September 27, 1772, at one o'clock a. m.; married Thomas Mann Randolph, jr., February 23, 1790; died October 10, 1836.

Jane Randolph Jefferson, born April 3, 1774, at eleven o'clock a. m.; died in September, 1775.

A son, (nameless,) born May 28, 1777, at ten o'clock a. m.; died June 14, the same year, at ten o'clock p. m.

Mary Jefferson, born August 1, 1778, at half past one o'clock a. m.; married John Wayles Eppes October 13, 1797; died April 17, 1804, between eight and nine o'clock a. m.

A daughter, (nameless,) born in Richmond, November 3, 1780, at a quarter before eleven o'clock p. m.; died April 15, 1781, at ten o'clock a. m.

Lucy Elizabeth, born May 8, 1782, at one o'clock a. m.; died 1784.

Martha's husband, who was afterward member of Congress and governor of the State, died in 1828; Mary's husband in 1825, (Lanman says 1823.) Mr. Eppes was a distinguished Representative and Senator in Congress. Their son Francis was their only child living at Jefferson's death, but is long since dead. His descendants now reside in Florida.

Martha had twelve children, whom I shall here name in the order, I believe, of their birth: Ann Cary Randolph married Charles Bankhead, of Virginia, and died the same year with her grandfather; Thomas Jefferson Randolph died in 1875; Eleonora Wayles Randolph died in 1795; Eleonora Wayles Randolph (second) married Joseph Coolidge, of Boston, and died in 1876, a year after her father; Cornelia Jefferson Randolph died in 1871; Mary Jefferson Randolph died in 1876; Virginia Jefferson Randolph married Nicholas P. Trist and died in Washington during the present year; James Madison Randolph died in 1834; Benjamin Franklin Randolph died in 1871; Merriwether Lewis Randolph died in 1839; Septimia Randolph married Dr. David Scott Meikleham, of Glasgow, Scotland, now deceased; and George Wythe Randolph died in 1867.

Jefferson's daughter Martha, Mrs. Meikleham's mother, and her children received the particular care and love of her father. When she was only eleven years of age, a year younger than Mrs. Meikleham was at Jefferson's death, and one year after the death of her mother, he left her at school in Philadelphia with Mrs. Hopkinson while he journeyed to Annapolis. November 28, 1783, he wrote her a letter informing her that he had arrived at Annapolis safely "after four days' journey." He tells her to improve her opportunity for education, as that would console him for having to part with her and would prevent the diminution of his love; it could not be increased. He asks her to consider her teacher as her mother, with whose loss Heaven had been pleased to afflict her; that should she do anything to incur her teacher's disapprobation she should think no concession too much to regain her good will. He suggested the distribution of her time:

"From eight to ten, practice music.

"From ten to one, dance one day and draw another.

"From one to two, draw on the day you dance and write a letter next day.

"From three to four, read French.

"From four to five, exercise yourself in music.

"From five till bed-time, read English, write," &c.

He wanted her to write to him by every post, and to tell him what books she read, what tunes she learned, and to inclose to him her best copy of every lesson in drawing; to take care and never spell a word wrong. It is great praise for a lady to spell well. He had placed his happiness on seeing her good and accomplished; and no distress which this world could now bring would equal her disappointment of his hopes. A fortnight after, he wrote her a letter warning her to disregard rumors then prevalent about the end of the world. The Almighty had never told anybody when he would end it. The best way to be prepared for the end of the world or for death, which was a more certain event, was never to do or say a bad thing. Ten days later he wrote her on the subject of dress. He wanted her to have fine but not gay dresses. She should see that her clothes were clean, whole, and properly put on. She should, from the moment she rose till she went to bed, appear as cleanly and as properly dressed as at dinner or tea, so that she could at any time be seen by any gentleman without a pin being amiss.

On the 5th of July, 1784, Mr. Jefferson sailed on a diplomatic mission to Europe from Boston for Cowes, in England, taking with him his beloved Martha, leaving his two younger daughters, Mary and Lucy, six and two years of age, behind him, never more to see the latter, as she died during the year. They made the voyage in three weeks. Martha was then twelve years of age, and was placed at a convent school in Paris, L'Abbaye Royale de Panthémont, the most fashionable and select seminary in France. To this school many letters from him were directed to her. In one of them he says:

The more you learn the more I love you; and I rest the happiness of my life on seeing you beloved by all the world, which you will be sure to be if to a good heart you join those accomplishments so peculiarly pleasing in your sex. Adieu, my dear child. Lose no moment of improving your head nor any opportunity of exercising your heart in benevolence.

In another letter, when she was fifteen, he lectures her on the evils of idleness. In another he tells her that her sister "Polly," (Mary,) then nine years old, was coming, and that she must act the mother to her younger sister, then his only other surviving child:

Teach her above all things to be good, because without that we can neither be valued by others nor set any value on ourselves; teach her to be always true; no vice is so mean as the want of truth and at the same time so valueless; teach her never to be angry; anger only serves to torment ourselves, to divert others and alienate their esteem; and teach her industry and application to useful pursuits.

It was no wonder that Martha (his Patsy) grew up to be, as one of her eulogists described her:

The most dutiful of daughters, the most attentive of learners, possessing a solid understanding, a judgment ripe beyond her years, a most gentle and genial temper and an unassuming modesty of demeanor which neither the distinction of her position nor the flatteries that afterward surrounded her ever wore off in the least degree; she was the idol of her father and family and the delight of all who knew her.

These beautiful accomplishments of womanhood I may here say without fear of contradiction she transmitted in their full value to her now only surviving child, Mrs. Meikleham. Martha had now grown up to be a lady of seventeen; she had imbibed a strong love for the school in which she was secluded, and for the holy sisterhood of Panthémont. She wrote to her father in April, 1789, for his permission to remain in the convent and to dedicate herself to the duties of a religious life. To this letter she received no answer, but in a day or two afterward his carriage came to the door. He met his daughter with the kindest smile and warmest love. He had a private interview with the abbess, and a few minutes afterward the carriage with Mr. Jefferson and his two daughters drove away from the quiet seclusion of a home in which she had grown to young womanhood adorned with every virtue and accomplishment.

Neither Martha nor her father, then or ever afterward, referred to the subject, but in after years, when he was gone, she spoke of it to her children with approbation of her father's course. It should be observed that for several months before this request of his daughter he contemplated taking them from the convent to return to the United States. Indeed, in a letter to Mr. Francis Eppes, sr., he had fixed the date of his intended departure for the United States about the very day on which he took his children from the convent. He left Paris on the 26th of September, 1789, and on the 23d of October left England with his two daughters, and in due time arrived with them at Monticello, where they had a princely reception from his numerous servants, who took the horses from the carriage and drew their master and his daughters to their welcome mountain home.

While they were yet at sea Washington had written to Jefferson tendering him the appointment of Secretary of State.

On the 23d of February, 1790, three or four months after her return to the United States, Martha was married to Thomas Mann Randolph, jr., eldest son of Colonel Thomas Mann Randolph, of Tuckahoe, Virginia. It is worth noting that both Jefferson's daughters married their cousins, and that the husbands of both, while young men at college, and before contemplating such pleasant relationship, had written to Mr. Jefferson, at Paris, for advice as to their course of life. Young Randolph was a student at the University of Edinburgh, and visited Paris in 1780. I have already given a description of the mother of Mrs. Meikleham, a portrait of her father by the same hand will not be out of order:

He was tall, lean, with dark, expressive features, and a flashing eye, commanding in carriage, elastic as steel, and had that sudden sinewy strength which it would not be difficult to fancy he inherited from the forest monarchs of Virginia. (He was descended by several different strains of blood from Pocahontas.) He was brilliant, versatile, eloquent in conversation when he chose to be, impetuous and imperious in temper, chivalric in generosity, a knight-errant in courage, in calm moments a just and at all times a high-toned man. His education was a finished one; his reading was extensive and varied; his fortune was ample in prospect, and would have been immense but for the change effected in the Virginia statutes of descent by the efforts of his father-in-law.

In a week after the marriage Mr. Jefferson set out for New York to take his place in President Washington's Cabinet, and rented a house at No. 57 Maiden Lane. On the 9th of February, 1791, he writes to her and says:

Your last two letters are those which have given me the greatest pleasure of any I ever received from you. The one announced that you had become a notable housewife; the other, a mother. This last is undoubtedly the keystone of the arch of matrimonial happiness. Accept my sincere congratulations for yourself and Mr. Randolph.

Henceforth his letters contained frequent mention of his grandchild and requests that his daughter "kiss the little Anne for me." In one of his later letters (January 15, 1792) he expresses his desire to

be at home with them, "and dear little Anne, with whom even Socrates might ride on a stick without being ridiculous." At a still later date, May 17, 1798, he anticipated much pleasure in carrying home to her children from Philadelphia to Monticello "the game of the goose."

One extract more of his letters to this beloved daughter is all I shall notice. It is dated at Monticello, March 27, 1797. He had reached home from the Vice-President's chair and found both his daughters absent on an estate of Colonel Randolph:

I value the enjoyments of this life only in proportion as you participate them with me. All other attachments are weakening, and I approach the state of mind when nothing will hold me here but my love for yourself and sister and the tender connections you have added to me. [his grandchildren.] I hope you will write to me, as nothing is so pleasing during your absence as these proofs of your love. Be assured, my dear daughter, that you possess mine in its utmost limits. Kiss the dear little ones for me; I wish we had one of them here.

And thus through many letters during his Vice-Presidency he expressed his longing to get away from the turmoil of politics to his quiet home, to enjoy the society of his two daughters, their husbands, and children. Mary he loved. She was like his departed wife, whose death so much affected him; but Martha was a Jefferson, and was like her father, as his only living grandchild is. Few women could have secured such a compliment as John Randolph paid her. When, notwithstanding his quarrel with her husband and father, her health was proposed at a table of gentlemen, among whom he was a guest, he rose with glass in hand and said: "I drink, gentlemen, to her—to the sweetest woman in Virginia." During her brief presidency of the White House in her father's Presidency of the nation she had one child born, added to the seven born, all but one, at Monticello.

Two days before her father's death he handed her a little casket in which, on opening it after his death, she found some papers written by him, in one of which he says: "The last pang of life is in parting with you;" but he would bear her love to her mother and sister, "two seraphs long shrouded in death." On another paper were written the following lines from Thomas Moore:

It is not the tear at this moment we shed,
When the cold turf has just been laid o'er him,
That can tell how beloved was the friend that's fled,
Or how deep in our hearts we deplore him.
'Tis the tear through many a long day wept,
'Tis life's whole path o'er-shaded;
'Tis the one remembrance, fondly kept,
When all lighter griefs have faded.

Thus his memory, like some holy light,
Kept alive in our hearts will improve them,
For worth shall look fairer, and truth more bright,
When we think how he lived but to love them.
And as fresher flowers the sod perfume,
Where buried saints are lying,
So our hearts shall borrow a sweetening bloom
From the image he left there in dying.

Jefferson was fond of Moore's poetry, notwithstanding the ridicule which the poet had heaped upon him in writing from Washington during Jefferson's Presidency. It is said that Mrs. Meikleham's mother shared with the President deep resentment at Moore's attack upon him, but upon the publication of his Irish Melodies, about the time of Mrs. Meikleham's birth, she showed him a copy. "Why," said Jefferson, "this is the little man that satirized me;" and on reading some of the melodies he exclaimed, "Why, he is a poet, after all!" From that till his death Moore's works were favorites at Monticello. Moore, in visiting this country, came across the ocean with a pompous British minister and his more pompous wife, Mr. and Mrs. Merry. The Federal party and the Republican party had been and were then in bitter hostility. The British minister sympathized with the Federalists. Moore fell in with the same set and lampooned the Republican party:

Which courts the rabble's smile, the rabble's nod,
And makes, like Egypt, every beast its god.

Jefferson had very decided republican ways with him, and he failed to make much demonstration on the reception of Mr. Merry and Mr. Moore, and the latter, in a letter to his mother, dated June 13, 1804, says:

I stopped at Washington with Mr. and Mrs. Merry for near a week. They have been treated with the most pointed incivility by the present Democratic President, Mr. Jefferson, and it is only the precarious situation of Great Britain which could possibly induce it to overlook such indecent, though at the same time petty, hostility.

It seems that Mr. and Mrs. Merry were invited to dine at the White House, and when dinner was announced the President gave his arm to Mrs. Madison, the elegant wife of his Secretary of State, when Mrs. Merry thought it should have been offered to her, and they were going to have war over the insult.

I have dwelt upon the love of Thomas Jefferson for his eldest daughter and her children to emphasize the confidence with which I appeal to this Congress for relief to the only living member of his family, now in our midst. She has made no appeal for assistance. An educated, high-minded representative of the Jeffersons and Randolphs of Virginia ought not to be allowed to wait till she appeals. Neither by her nor by any friend of hers, either directly or indirectly, was any suggestion made to me to introduce this bill. I happened to learn, through the great granddaughters of President Monroe, who live in

the same street where I reside in this city, that the granddaughter of the author of the Declaration was living in Georgetown, and without her knowledge, of my own sense of justice, propriety, and patriotism, I introduced this bill.

I have a pride in this Congress, and believe that on no page of its record will so proud a monument be perpetuated to its credit as that on which will be registered the passage of this bill. I have known personally every President of the United States since Monroe, save only Jackson, and highly as I esteem the privilege of having known as friends all our Presidents since then, including John Quincy Adams, who has frequently walked these streets leaning on my arm, I would count it higher honor to contribute to the comfort and independence by my single vote here, which is all that I can give, to save the only living descendant of Jefferson, who was born in his house and was the loved object of his affection, from poverty and want. I summon from his grave to plead for her the author of the Declaration, and the man who secured to us the undisputed possession of the Mississippi Valley and its exit to the sea.

Jefferson looked up from the depths of the gloom that was settling around him. He had justly hoped that his country would come to his rescue and clear away the cloud that was settling on his home and all that he loved dear. Or if too late to come to his rescue and save Monticello, they would not let his grandchildren beg bread or toil in old age through a country whose independence was the child of his own brain. Five months before his death he wrote to Mrs. Meikleham's brother this mournful message:

For myself I should not regard a prostration of fortune, but I am overwhelmed at the prospect of the situation in which I may leave my family. My dear and beloved daughter, [Mrs. Meikleham's mother,] the cherished companion of my early life and nurse of my age, and her children, rendered as dear to me as if my own from having lived with me, left in a comfortless situation, hold up to me nothing but gloom.

Of all that family none remain but one, and his voice, which I summon from the grave, pleads now for her in tones which I think this Forty-seventh Congress cannot refuse to hear. When he wrote that gloomy message now addressed to you, my fellow-members, Mrs. Meikleham was beside him trying to lessen his grief by words of womanly sympathy from girlish lips that pressed their warm kisses on lips that first pronounced our Independence, then growing cold in the gloom of approaching death.

She was then twelve years of age. She was the pet and solace of his later years. She was as like him as a beautiful girl could be to one of the rougher sex. His head of gold had turned to silver and her wealth of sunny hair recalled the glory of his own in his earlier manhood, and the hand that penned the noblest instrument ever written by man loved to play among its tresses. She sat upon his knee; she climbed upon his chair to play with his whitening locks, and brought many a smile to chase away the gloom and many a solace to succor his sinking heart. Is there any Representative here who can read the message which I have just quoted from the brink of his grave and see his foreboding of the distress of the only living member of the family for whom he pleaded verified in yonder lonely cottage whose humble roof is kept above her, only by the toil of a devoted daughter? Who will hesitate to vote for this relief too long delayed, but still in time to save our honor if we act promptly and generously? It will take but little from the Treasury, for her life in the common course of things cannot be long.

You have within the last month or two given, by a nearly unanimous vote by both Houses, \$10,000 to raise a monument to Jefferson's memory in the deserted ruins of Monticello. Think you that this pension which I ask from you for his grandchild who is living in our midst, and who deserves to have each member of Congress and the Cabinet and the President call upon her at least once a year while she lives—think you that this pension will not prove a more acceptable monument to his memory than shafts of marble or decorations over his grave? Think you if Thomas Jefferson's spirit can bend from the celestial abode of departed patriots and note what is occurring in this Capitol of his country that he would not a thousand times prefer to see that humble Georgetown cottage where dwells the only relative now living whom he ever saw on earth gilded by your munificence than all the marble you could pile upon his ashes at Monticello? You have during the present session given the same amount I ask for her to Mrs. Tyler, Mrs. Polk, Mrs. Lincoln, and Mrs. Garfield; none of them so well deserving as she deserves. Nor is there any danger of setting a precedent for other similar grants. We shall never have another living member to care for of that family circle which gathered around the dying couch of the author of the Declaration of Independence.

This sole surviving grandchild of our illustrious statesman and patriot, born in his house, fondled on his knee, carried in his arms, kissed by his lips, is now living in this District in straitened circumstances, a widow, with her delicate family, in a humble dwelling within sight of the White House, where her mother once shone as the first of American women; within the shadow of this Capitol which but for him would probably never have reared its majestic Dome above its assembled statesmen; within sight of that majestic column slowly mounting heavenward to perpetuate the fame of him who vindicated by his sword what his great compatriot had created by his pen. And shall she be permitted to feel no throb of patriotic pride pulsing around her humble home from the great heart of the American people represented in these Halls of Congress?

Senators and Representatives, I call upon you to see that this grandchild shall not suffer for anything you can give her for the brief time that she may live to keep alive the memory of the heroic age of this Republic.

Representatives of the great West, living in the almost boundless empire drained by the Mississippi and its tributaries, secured by him for the mere trifle with which he made by the purchase of Louisiana, free exit of this empire's commerce to the sea, will you see this only living heir of your benefactor who ever looked into the wealth of love which slept within his tearful eyes as he wrote that paragraph about her for whom I plead to-day—will you see her suffer for want of the pittance for which I pray?

I have called him from his grave to plead for his favorite granddaughter, the solace of his age. I summon from the speaking canvas of Trumbull, from whose lips I have heard the history of every majestic figure in his immortal painting; I summon the four patriots, Sherman, Franklin, Adams, and Livingston, the committee that stand around him as he reads the immortal document; I summon Hancock from his chair and Charles Thompson from his desk; I invoke the representatives of a nation, listening to his words while he "proclaims the story of its birth;" I summon the members sitting around him in their grand simplicity to come from the silent sitting of the Continental Congress in the Rotunda into this Hall, to our Forty-seventh Congress, their successors, to urge the cause of the only living grandchild of the majestic figure in their midst. I summon a jury of thirteen from the embryo States, one from each Colony represented in Independence Hall—Thornton of New Hampshire, Hancock of Massachusetts, Ellery of Rhode Island, Sherman of Connecticut, Livingston of New York, Witherspoon of New Jersey, Franklin of Pennsylvania, McKean of Delaware, Carroll of Maryland, Lee of Virginia, Penn of North Carolina, Rutledge of South Carolina, and Walton of Georgia—to find a verdict for this grandchild of the Republic. I call upon old Virginia, the mother of Presidents and his mother; on young Ohio, Virginia's child and his daughter. I call upon every State and Territory whose mountain passes and hillsides and plains contribute their varying rills and rivers to the volume of the Mississippi which bears their commerce to the sea through territory secured by him to this Republic for a mere nominal sum; I summon every Representative here from every district in the Union, from the Saint Lawrence to the Rio Grande and from the Atlantic to the Pacific, to ratify their verdict by a unanimous vote in favor of this bill.

Tariff and Tax Commission.

SPEECH

OF

HON. JOHN W. SHACKELFORD,

OF NORTH CAROLINA,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, April 11, 1882,

On the bill (H. R. No. 5315) to provide for the appointment of a commission to investigate the question of the tariff and internal-revenue laws.

Mr. SHACKELFORD said:

Mr. CHAIRMAN: I shall not now endeavor to present an argument on the question of the tariff in detail. I shall address myself rather to the objections to the pending bill, and then to such general consideration of tariff taxation as my limited time may permit. The bill is as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That a commission is hereby created, to be called the tariff commission, to consist of nine members.

SEC. 2. That the President of the United States shall, by and with the advice and consent of the Senate, appoint nine commissioners from civil life, one of whom, the first named, shall be the president of the commission. The commissioners shall receive as compensation for their services, each at the rate of \$10 per day when engaged in active duty, and actual traveling and other necessary expenses. The commission shall have power to employ a stenographer and a messenger; and the foregoing compensation and expenses to be audited and paid by the Secretary of the Treasury out of any moneys in the Treasury not otherwise appropriated.

SEC. 3. That it shall be the duty of said commission to take into consideration and to thoroughly investigate all the various questions relating to the agricultural, commercial, mercantile, manufacturing, mining, and industrial interests of the United States, so far as the same may be necessary to the establishment of a judicious tariff, or a revision of the existing tariff and the existing system of internal revenue laws, upon a scale of justice to all interests; and for the purpose of fully examining the matters which may come before it, said commission in the prosecution of its inquiries is empowered to visit such different portions and sections of the country as it may deem advisable.

SEC. 4. That the commission shall report to Congress the results of their investigation, and the testimony taken in the course of the same, from time to time, and make their final report not later than the first Monday in January, 1883.

Mr. Chairman, I am opposed to the bill, and shall vote against it for many reasons. In the first place, sir, the commission provided for in the bill, with powers therein granted, will, in my humble judgment, neither relieve the oppression of the people nor satisfy their complaints.

To every one who can read the Constitution—and there are few of our constituents that cannot—it seems to me that the duties of Congress in regard to this matter of taxation are therein clearly and sharply defined. The first clause of the eighth section of the first article of the Constitution reads as follows:

The Congress shall have power to lay and collect taxes, duties, imposts, and excises, to pay debts, and provide for the common defense and general welfare of the United States.

Now, sir, note particularly the imperative mood *shall*; the Congress shall, and yet, while the people are suffering from a high tariff taxation that is not paralleled under any known despotism in the world; while every trade and art within the length and breadth of this fair land is in distress; while the poor mechanic cannot school his children as he would and the poor farmer can barely make a living, much less save anything for a rainy day; while monopolies grow great and strong, and tower with brazen front toward heaven, and the poor victims of taxation and tyranny shrink and cower and grow powerless before their fearful fate; while all this little less than tragedy is being enacted we, "the Congress," propose to shirk our responsibility by delegating powers to a commission of nine. The Constitution says "Congress shall have power," yet every vote cast in favor of this bill will say Congress shall not have power, and certainly it will be powerless from the time this bill is passed until the commission make their report.

Now, Mr. Chairman, let us suppose the bill passed, and the commission of nine appointed, Congress is then without power to revise the existing tariff and the existing revenue laws. It has sent forth this commission "to thoroughly investigate all the various questions necessary to the revision of the present tariff, or the establishment of a judicious tariff, upon a scale of justice to all interests." Is it not evident that Congress will have sentenced itself to remain in ignominious silence on all questions relating to the tariff? Sir, this Morrill (immoral) tariff was engendered by the necessities of war, and now after seventeen years of peace its slimy folds encircle what Jefferson called the four great pillars of our prosperity: our agriculture, manufactures, our commerce, and navigation; with its serpent's trail in every house, over every farm, on the family Bible and within the picture book of the child; with its hurtful sting meeting us everywhere; with the memory of the broken promise hissing in our ears that it was to be repealed when the internal taxes were reduced on home manufactures; this bill to create a tariff commission is to be passed, and we, the Congress, relegated to silence. We must wait powerless until these nine irresponsibles return from their travels, their winning and dining, and make a report. No matter what exigencies may arise, what unforeseen strain be thrown upon the business interests of the country, no matter what the sudden need, how bitter or how loud the cry for help, it will be unavailing. Disrobed of its power, this House will stand confessed to the country and the world, that either through cowardly fear or inability it was unwilling to cope with questions that had been put into its keeping by the Constitution.

And so, sir, we must sit here from day to day listening to the mutterings of the coming storm of anger rising from those who are chafing restively beneath their burdens, and tell them that there is no relief. Pitiable spectacle! The sovereign power of fifty millions of people have empowered the President to send out a commission of nine, and can do nothing until they report.

Sir, this bill is but a subterfuge for delay. Indeed, the honorable Senator from Iowa, [Mr. ALLISON,] during its discussion in the Senate, gave this as one reason why the bill should receive his sanction and support. He said:

And if this bill is voted up or voted down, every Senator here must know that it is a practical impossibility to consider the tariff question at this session of Congress; and if it is a practical impossibility during the remainder of this session, it is equally impracticable to consider it during the next session, which lasts only three months, when we are pressed night and day for the consideration of appropriation bills.

Therefore we may just as well understand here and now that this proposition is a proposition to postpone until the next Congress the consideration of the tariff question, and I shall vote for it with that understanding.

This language of the honorable Senator from Iowa I find in the CONGRESSIONAL RECORD of March 29. It is to be commended in that it is frank, manly, and bold. With a courage worthy of a better cause, he first frankly admits that this bill is a proposition to postpone, and then boldly asserts that he shall vote for it with that understanding. This eminent advocate of protection has thus openly declared postponement and delay to be the object of the bill. Being a friend of the measure, he is an authority whom we can safely quote without incurring the possibility of becoming amenable to the charge of misrepresentation. Sir, I regard delay, when viewed in connection with the state of our finances, as little less than criminal. All admit the fact that we have a surplus revenue that is piling up at the rate of \$150,000,000 per annum above the current expenses of the Government; that this tariff is extorting from the people this gigantic sum for which there is neither immediate use nor prospective need is also admitted.

Where, then, sir, I ask in the light of these facts, can be found the shadow of a reasonable excuse for prolonging the present tariff, supplemented as it is by an odious and obnoxious system of internal taxation.

Let us meet the issue of revision and readjustment here and now,

without delay or postponement, without incurring the extra expense of creating an unconstitutional commission to discharge duties and perform functions of government for which we were elected and are paid, and upon which it is our sworn duty to legislate, and relieve the people from these burdens of excessive and unequal taxation.

Mr. Chairman, the bill under consideration originated with the Committee of Ways and Means. It is their offspring, and, to all appearances, is likely soon to become the adopted child of the Republican party. It is a most remarkable bill. It actually contains the admission that the present tariff and the existing revenue laws need revision.

I thank thee, Jew, for teaching me that word!

Need revision! And not only that these laws need revision but the bill further tells in what respect the revision is needed, namely, "on a scale of justice to all interests."

A second Daniel come to judgment.

Now, sir, these admissions are made freely, voluntarily, and without request; they admit that these laws ought to be changed—that injustice is being done, that oppression is doing its work in the guise of laws that are both unequal and unjust—all this they concede, and yet some of these gentlemen, protectionists and advocates of this bill, openly avow that they will give it their support, because it will delay and postpone the very relief which they themselves concede to be necessary.

Mr. Chairman, it is said that there is a reason for all things; and as I have listened to the gentlemen, many of whom have so strongly and eloquently urged the passage of this measure, I have asked myself what is the reason of all this? Why is it that those who having, as they tell us, been constrained by the necessities of war to devise and pass these laws—who now, in time of profound peace, admit the necessity of their repeal—why is it that by every means within their power they struggle against repeal and endeavor to prolong their existence?

Why is it that, with a surplus revenue of nearly half a million per day flowing like a mighty river into the national Treasury, that they are unwilling to relieve the people of their burdens? And if not unwilling to relieve them, why do these protectionists seek to put afar off the day of relief by transferring their duties and powers to a commission to be appointed by the President? Sir, men do not thus juggle with themselves unless for some real or fancied advantage. We have seen that the two ruling ideas in this movement of the protectionists are, first, delay and postponement of the revision of the present tariff, and, second, that certain powers vested by the people in Congress are to be transferred to the appointees of the Executive. Delay will give time, and time they hope will secure them a new lease of power.

"Time is money," and the old adage has an added significance when viewed in the light of our present revenue piling up its surplus of half a million a day. Irresistibly the question rises—and, like Banquo's ghost, it will not down at our bidding—for what purpose is this menacing accumulation of treasure permitted to increase? We know that money is power; that in politics it never produces patriots, but too often begins by arousing their cupidity, and ends by making them corrupt. So, sir, we see that delay gives time; time is money; money is power—a dangerous power in the hands of a government like ours. A power that too often breeds a species of corruption that is fatal to the liberties of the people.

Sir, if this bill becomes law, I believe that the future will show that the commission will be the President absolutely, that is, the majority if not all of its members will be his personal friends, in perfect accord with his opinions on the tariff, and their report will comport with his theory. Desiring a second term, or at least a continuance of power for his party, will not the report of this commission be so constructed that it may be used as a fitting plank in the platform upon which shall stand himself and the Republican party in the coming great political conflict of 1884? May he not wish to be the hero of that struggle? and if the hero, the victor? "Thy wish was father, Harry, to that thought," said England's dying king to the prince, who, during his father's sleep had dallied with the crown he expected so soon to wear.

So, sir, we say to the advocates of this bill. But mark! Prince Harry lifted only the symbol of power to his head, toyed with it a moment, and then replaced it within the sovereign's reach; but the advocates of this bill seek wrongfully and illegally to wrest the power itself from where the sovereign people have placed it, and that, too, with no assurance that having been misplaced it will ever again be replaced. The power is vested by the people in their representatives whom they have sent here. Not in the President. Not in a party. Not even in a commission of nine, but in Congress.

Sir, we may think the people sleep, as did the prince his father. We may take the power and with it crown a party or a President; but the people will awake, they will arouse from their lethargy, and the might of their protest, the biting scorn of their indignation will be felt by every supporter of this infamous bill when remanded, as he surely will be, to his political grave.

Sir, we are told that this element of danger to which we have alluded is a mere chimera of the mind; that it has no real existence; that delays are not dangerous; that a vast accumulation of treasure is not productive of partisan schemes of extravagance and

corruption; that in the transfer of power from Congress to the Executive there is no immediate danger. All of this I most emphatically deny. Yet for the moment, and for the sake of argument, let us admit that these assertions are true; admit, too—and this I am unwilling to do—that the present incumbent of the Presidential chair is too wise, too patriotic to misuse or abuse the powers intrusted to him; that the same moderation, the same delicate consideration that he displayed in all matters pertaining to the national bereavement, that the judicial calmness and fairness that he exhibited both immediately before and after the lamented death of his predecessor will, in the future as in the past, characterize and distinguish every official act of his administration. Admit all this, and much more were it possible, and I still regard it as most dangerous to establish this innovation as a precedent; an innovation, too, to the misleading influence of which there can be no definable limit when once it is lifted in defiance of the law into the dignity of a precedent.

It augurs ill, indeed, for the perpetuity of the constitutional forms of our Government, when the limitations defining the powers of any of the branches of the National Government can be thus lightly set aside or transferred by one to the other. The fathers transmitted to us, their sons, the Constitution as a political law and guide, and whenever either the executive, judicial, or the legislative are permitted to transfer their constitutional powers, or any one of them, to usurp those of the others, then confusion, chaos, and anarchy are invited to sit in the high places of law, order, and liberty.

These, Mr. Chairman, comprise some of the objections to the passage of this bill, together with the principal reasons for my opposition to the appointment of a tariff commission.

As I stated in the beginning of my remarks, it is not within the scope of my present purpose to present an argument on the tariff question. It will be time enough to do that whenever the Committee of Ways and Means, in its almost infinite wisdom, shall see fit to report a bill containing a detailed schedule of rates for a new tariff or a revision of the one now in force.

Sir, I have alluded to this tariff and the internal-revenue laws as being unjust and unequal in the distribution of their burdens upon the people. I desire, as briefly as possible, to substantiate these statements.

The question which confronts us to-day is not as to the relative merits of free trade and protection; it is a question of taxation and taxation alone. True, as I have endeavored to show, this bill to create a commission seeks earnestly to continue the present high tariff for the purpose of protection. Its friends will support it, as we have seen, not because it continues this tariff as a means of raising revenue, but simply because it is forcing agriculturists and others to pay the manufacturers of this country the enormous sum of \$300,000,000 per annum; this, too, in the face of the fact that it pays but \$200,000,000 to the Government. This they call protection. The necessity for meeting the expenses incidental to a vast war called it into being. Framed to produce sufficient revenue to sustain the Government in its struggle for life, its high rates were imposed, inflicted, and most nobly and uncomplainingly borne, during a period when gloom and a darkness that could be felt filled the political heavens.

From 1861 until the present time this Morrill tariff has been in force. True, a few slight reductions have been made, as in duties on raw cotton, silk, dyes, and a few drugs; but with these exceptions, from that day to this we have made no revision or reduction of the tariff. Every reason that demanded its origin and existence has long since passed away.

For nearly eighteen years we have been at peace, and during that time nearly one-half of our national debt has been paid, two-thirds of its annual interest has been abated, and the revenues are now very largely in excess of the needs and demands of the Treasury. Created for revenue, we are now told it must be continued for protection! Protection for whom? Is it to protect the workers of every class, all, of high or low degree, who, by brain or muscle, mind or body, seek to develop and enlarge our revenues, our influence and wealth? Let us see. The detailed figures of the census for 1880 are not yet available, but the following table, prepared by the distinguished gentleman from New York, [Mr. Cox,] will show the percentage of the working force of the nation engaged in agriculture and other vocations. He says:

In 1870 the census returns figured the number of the country's working force at 12,500,000. If the ratio of increase is the same as for the general population, our working force now numbers about 15,000,000. Now, suppose these working and business people to be distributed as they were ten years ago; we obtain this exhibit:

Vocation.	Per cent.	Number engaged.
Agriculture.....	47	7,050,000
Professions and personal services.....	22	3,300,000
Trade and transportation.....	9	1,355,000
Manufacturing, mechanical, and mining.....	22	3,300,000

This reduced to terms of tariff means that the protected workers are 3,300,000; unprotected workers, 11,700,000.

Why is it that this small proportion of our population should be

thus favored, 22 per cent. of the workers only, a trifle over 3,000,000 of our whole population who are directly or indirectly benefited by the tariff, while 47,000,000 are taxed on nearly everything they consume or wear at the average rate of 45 per cent.?

Sir, this is living under a high protective tariff with a vengeance. Rather let us call it a high protected steal.

The theory of its advocates is that the industries of this country cannot prosper in competition with foreign labor, and so, to exclude cheap goods from our markets, we pay to these protective classes over \$300,000,000 per annum. There would be at least a show of justice if this sum was equally divided among all the 15,000,000 workers, giving them each their legitimate share; but as it now is, the law puts its iron hand into the pockets of 78 per cent. of the workers, saying our great manufacturers cannot prosper unless you pay them a bonus, or royalty of 45 per cent. on all that you purchase.

The \$200,000,000 of revenue realized by the Government is not included in this computation; neither are the vast amounts paid to customs officers as salaries, the cost of buildings, expenses of collection, &c., which will swell the aggregate to \$750,000,000 per annum, as the total tax paid by consumers on protected goods. Thus we see that 78 per cent. of the workers are taxed, or rather robbed by the strong arm of the law, to protect and enrich the remaining 22 per cent.

Mr. Chairman, already we have heard protectionists claiming that this enormous tax is laid upon the people, not to produce revenue, but for the purpose of strengthening those who are weak, to benefit those who are most needy. Is this true?

Does this tariff benefit the class that delve from early morn until "the shades prevail," who earn their bread by the sweat of their brow, at hard and honest toil? Does it benefit the poor fisherman, who rides the angry waters and perils life and limb on the storm-riven coast of the Carolinas, to eke out what proves too often to be but a scanty subsistence for the loved ones sheltered in the rude cabin on the beach? Does this tariff benefit him who swings the ax, and day by day enlarges the little clearing, till sunshine and shower, together with the labor of himself and little ones, succeed in bringing the first golden crop of corn from the yet unplowed soil? If these be aided, if the honest, hard-working son of toil be helped, who will object?

Let us examine, then, some of the rates imposed on a few articles by this tariff. There are articles of food, of medicines, and of clothing, such as every poor man is compelled to purchase; these we will call articles of necessity.

There are other articles, such as wines, cut-glass, diamonds, jewelry, laces, embroideries, &c., these only the rich or well-to-do can indulge in; they are luxuries. Now, sir, I find these have been tabulated by Mr. J. S. Moor, and the figures show most conclusively that this tariff operates against the poor and in favor of the rich. Sir, when the rich purchase diamonds 10 per cent. ad valorem is added to their cost. The poor man buys a blanket; 89½ per cent. is the added favor extorted from him by this tariff. His child breaks a window-pane, and to replace it he pays from 58 to 73 per cent. either as a penalty for the child's mishap or his own extravagance in using window-glass instead of a board shutter. Remember the figures, oh, ye protectionists, that claim this tariff benefits the poor and the needy—58 to 73 per cent. (varying as to quality) on this poor man's window-pane! While over there, across the street—he can see it through the open window, ranged artistically on the elaborately carved sideboard—is a beautiful service of the richest cut-glass on which the wealthy owner paid but 40 per cent!

Rate of duties collected in 1880, in ad valorem, taken from official returns.

Articles of luxury:	Per cent.
Laces, cords, gimps, and braids.....	35
Diamonds.....	10
Embroideries.....	35
Fancy articles.....	35
Richest kind of cut-glass.....	40
Jewelry.....	25
Musical instruments.....	30
Champagne, in pints.....	47½
Champagne, in quarts, \$6 per dozen.....	50
Still wines, in bottles.....	32½

Now let me place against the above what I deem articles of necessity, and see what duty they paid:

Duties paid in 1880, calculated in ad valorem, taken from official returns.

Articles of necessity:	Per cent.
Cleaned rice.....	95½
Epsom salts.....	7½
Chicory.....	102½
Spoon thread.....	73
Window glass, common.....	from 58½ to 73
Band and hoop iron.....	69
Boiler plates.....	93
Horseshoe nails.....	79½
Locomotive tires.....	99
Steel rails.....	148
Castor oil.....	148
Croton oil.....	136
Paris white.....	240
Balmoral alpaca.....	91
Blankets, valued at 36½ cents per pound.....	89½
Woolen hosiery, valued at 60 cents per pound.....	100½
Bunting, valued at 23 cents per pound.....	121

These, sir, are the actual figures taken from the official returns. I quote them that the people may see what this tariff is; how much it costs the poor; how little it costs the rich. Sir, in no phase of action is the Cartesian axiom, "Learn what is true that we may do what is right," more important, more imperatively necessary than in legislation touching the subject now under consideration.

Let us now look for a moment at the interest of the farmer, and endeavor to learn what is true of his position. Let us note the magnitude of his interests and their bearing on the prosperity of the country, and ask how are they protected, how sheltered, how fostered by this system?

We have seen that 47 per cent. of the workers of this country are engaged in agriculture. This, however, does not include all the workers in this vocation. In a majority of instances the farmer of small means is compelled to engage the assistance of every available member of his family to aid him in his business.

Either in house or barn, or field, the good wife and children are all busy workers with the farmer, and indeed it is no infrequent case that the wife is a better farmer than the husband. Yet, of the services of these, the census-taker makes no note; he counts one or two agriculturists (as perhaps the father and an elder son) in a family where there may be four or five.

With this fact in view it is safe to say that full 60 per cent. of our entire population are engaged in agriculture. The majority of our fifty million are farmers. How seldom is the fact alluded to; how still less rarely is its significance appreciated.

Monopolists and protectionists grow eloquent as they tell us of the value and magnitude of the great iron interests of Pennsylvania, and their need of protection. Rarely indeed do we hear of the farming interests of that State, and never of their need of protection. Yet the total value of the crude ore taken from her iron mines in 1880 was less by \$8,571,449 than the value of her hay crop alone.

We are told of the marvelous richness and the untold wealth of the gold and silver mines of California. Her agricultural resources are dwarfed into littleness and made to appear inferior both in value and importance when viewed in the fascinating though deceptive light reflected by the brilliancy of her precious metals. Yet the following table, taken from the last census, will show that for the ten years ending in 1880 the total value of gold and silver produced by her mines was worth less than the value of her wheat crop by \$131,272,797:

Product and value of wheat in California, 1871 to 1880, against the value of her gold and silver mines for same time.

Years.	Bushels.	Value.	Value of gold and silver produced in California.
1871	16,757,000	\$23,627,370	\$20,000,000
1872	25,600,000	28,416,000	19,049,098
1873	21,504,000	28,385,280	20,300,000
1874	28,380,000	28,096,200	17,753,151
1875	23,800,000	28,084,000	17,300,000
1876	30,000,000	34,200,000	16,000,000
1877	22,000,000	28,600,000	17,634,000
1878	41,990,000	43,249,700	20,000,000
1879	35,000,000	43,050,000	18,600,000
1880	33,877,600	32,522,496	19,870,000
Total.....		318,231,046	186,506,249

Sir, these facts and figures enable us to realize something of the value and magnitude of the agricultural interests of our country. The farmer produces 83 per cent. of all our exports; 70 per cent. of the 6,000,000 bales of cotton we raise and thousands of barrels of turpentine are sold in foreign markets. Thirty-four per cent. of all breadstuffs raised in this country are purchased by foreign nations. Their markets govern the price of cotton, turpentine, and the price of grain at the home mart in every town and at the farm. No one can dispute the fact that the London and Liverpool markets govern the price in New York. Thus all our agricultural products are forced to find sale in open competition with the world, whether sold at home or abroad. Who talks of protection for these? Sir, the farmer feeds, clothes, and employs nearly one-half the entire population. He creates three-fourths of all our wealth and supplies 83 per cent. of all that we send abroad for sale. He asks no protection; he only asks that the unjust taxation forced on him by a tariff to protect the manufacturer at his expense be abated.

In 1870 the census showed that the value of all the agricultural implements used by the people was \$336,878,420. One-third of this cost is caused by the tariff, and is a dead loss to the farmer, inasmuch as it increased by that much the cost of producing the crops. Thus it is that the iron law of a protective tariff stabs his interest and robs him of his substance. On his plow, his harrow, his round-shave, and his hoe, he pays 50 per cent. ad valorem; on his ax 40 per cent.; when sick he takes down 148 per cent. tax with his castor oil; and, when dead, why, the very nails in his coffin are taxed 1½ cents per

pound, and driven with a hammer on which 2½ cents per pound was paid. Let us not attempt to follow him beyond the verge of the grave. Let him rest in peace; he needs it. Nor political steal, nor infernal revenue laws, nor high tariff taxation, "nothing can touch him further."

Sir, is it not a self-evident truth that any system that inflicts injury on agriculture—that industry that produces three-fourths of our wealth—must be injurious to the whole country?

What right has the Government to take from the farmer to give to the manufacturer? It disturbs the equality of each before the law; it taxes the many for the benefit of the few; it make one poor and another rich by legislation.

Solon, on being asked what was the best government, answered, "That which considered an injury to the least of its citizens an insult to the community." Had he been asked what was the worst government, he might have answered, that which inflicts injuries on the majority of its citizens, and adds insult to injury by proclaiming that it is done to protect the minority.

Sir, I have no hostility to manufacturers. I wish to see them share in the prosperity of the whole country, to flourish under its liberties, to be protected by the same laws and the same flag; but I fail to perceive any good or sufficient reason that entitles them to receive special favors or peculiar privileges. There is neither reason nor justice in this system of laws for their protection. It is a system designed to elevate one interest in society to an undue influence and importance; it is a system intended to benefit one class of citizens at the expense of every other; it enriches one State to the injury of others. Against such a system, one in every respect partial, unequal, and unjust, I most emphatically, most solemnly protest.

And now, Mr. Chairman, how shall words of mine fitly portray the condition of my people, when we consider that in addition to these high-tariff burdens there is also that other system of internal-revenue taxation pressing like some mighty mailed hand upon their every interest. Odious in its very nature, it pries with inquisitorial meanness into their private affairs, disturbs the natural relation of buyer and seller, and employs at the expense of the people a vast horde of spies and informers who fatten on the exorbitant fees and emoluments wrung from the hard hands of honest toil.

The "woes unnumbered" suffered by Greece were not more hurtful to the countrymen of Homer than is the influence and presence of these spies and informers among the people of the South.

The dread and devastating march of the army-worm is not more destructive to our cotton and corn than is this army of internal-revenue officers and detectives to all those sentiments of patriotism, of respect, of confidence, and love of law and order, which it should be the concern of every enlightened government to foster and inspire, and without which the strongest must soon crumble into ruin.

Sir, in my district I have seen the poor man working among his turpentine boxes watch the passing stranger with a distrustful, critical eye, not daring to take a piece of "twisted fence lock" tobacco from his own pocket until the stranger had passed out of sight, lest he might be reported for using tobacco that had not been regularly stamped, and upon that information his little estate be assessed, and the whole of it taken to pay the fine and satisfy the cravings of the revenue officers.

Why should not these poor men be permitted to raise and manufacture a little tobacco and sell it or barter it to whomsoever they please, just as we do our cotton or corn? These men are brave, simple, honest toilers, often unlettered it is true, and for this reason are unable to see or understand why it should now be a penal offense for them to buy a plug of tobacco from a passing wagon as they used to do. But the law prohibits them from purchasing less than a box from the wagon, and being poor they are compelled to go to the merchant, who necessarily charges a higher price, and thus these men, these tillers of the soil and makers of our turpentine, have confused ideas in regard to our laws and our Government. They are led to look upon law as their enemy rather than their protector; upon Government and its officials as oppressors rather than their benefactors.

Mr. Chairman, I represent a farming district. I am in part a farmer myself. Through life my associations have been with those who have earned their livelihood by honest toil. My constituents are honest farmers, they pay their debts and their taxes too, and know too well what it costs them to meet the demands of this high tariff and internal-revenue taxation. These are the men, these are the interests that should be protected, and I know of no better way to protect them, no surer, no more effective way of relieving them, than at once to lift from their already bent and overburdened shoulders this overwhelming weight of taxation.

And now, sir, that I may not be misunderstood, let me state in conclusion that I am in favor of—

1. An immediate reduction of the revenue to the legitimate needs and proper expenditures of the Government.
2. An equal distribution of duties, so that none may be favored and none have just cause for complaint.

Sir, a tariff for revenue is beneficial in that it seeks to perpetuate the form of government most desired by the people. It is the cost of law and order. It is an equitable mode of meeting the expenses of the Government. The controlling object of a revenue tariff is to secure duties with the least burden—the largest revenue at the

smallest cost to the people. It seeks to fill the Treasury with the means whereby all legitimate expenses of the Government may be met. This it does smoothly, with the least possible friction and without a single principle involved that can antagonize or endanger our republican form of government.

A revenue tariff rightly adjusted infringes on no man's right, curtails no one's liberty; protecting as far as it prevents foreign competition, it will relieve the burdens of taxation by so equalizing the pressure that it will bear heavily on none. Founded on principles just and true, its duty and its glory will be to sustain and preserve this fabric of political freedom, this temple of liberty, founded by the patriots of the past, wherein the smallest right of the humblest citizen is held too sacred to be rudely shaken, too precious to be unworthy of preservation.

Reduction of the National Debt.

REMARKS

OF

HON. NELSON DINGLEY, JR.,

OF MAINE,

IN THE HOUSE OF REPRESENTATIVES,

Saturday, July 1, 1882,

On the joint resolution (H. R. No. 250) to authorize an issue of bonds at a lower rate of interest.

Mr. DINGLEY said:

Mr. SPEAKER: In a debate in this Chamber on the 20th of March, 1880, my predecessor, Representative, and now Senator, FRYE, presented in an able and conclusive speech the wonderful success of the financial policy adopted by the Republican party to meet the gigantic expenditures of the war to preserve the life of the nation. In that speech it was clearly shown that the success of this policy was due to a rigid maintenance of the pledge of the Government made to those persons who advanced money to meet the expenses of the war, by the act of February 22, 1862, in the following terms:

The coin paid for duties on imported goods shall be set apart as a special fund, and shall be applied as follows:

First. To the payment in coin of the interest on the bonds and notes (greenbacks) of the United States.

Second. To the creation of a sinking fund sufficient to pay at least 1 per cent. annually of the principal of the debt.

In that speech it was also shown that by the observance of this pledge of the nation to pay the interest and principal of the public debt in coin, unless otherwise specifically provided for, the United States Government, which, under the administration of President Buchanan, before the breaking out of the civil war, could not negotiate a loan of only \$10,000,000 without paying 12 per cent. interest for half of it, was able to borrow nearly \$2,800,000,000 at an average of 6.6 per cent. interest, in a time of a most terrible war, when the life of the nation was at stake.

The following table will show the ascertained interest-bearing and non-interest-bearing indebtedness of the nation August 31, 1865:

Debt bearing 4 per cent. interest	\$618, 128
Debt bearing 5 per cent. interest	269, 175, 727
Debt bearing 6 per cent. interest	1, 281, 736, 439
Debt bearing 7.3 per cent. interest	830, 000, 000
Total debt bearing interest	2, 381, 530, 294
Debt not bearing interest	463, 119, 332
Total national debt	2, 844, 649, 626
Less cash in Treasury	88, 218, 065
Net debt	2, 756, 431, 571
Annual interest on debt	150, 977, 608

He further showed that by pursuing this policy of good faith after the close of the war, in the face of most persistent opposition, the Republican administrations were able not only to rapidly pay off \$786,439,682 of the principal of this debt up to February 1, 1880, but also to refund the balance from time to time at a lower rate of interest, and thereby at that date to reduce the annual interest to about \$83,000,000; and to accomplish this, too, while at the same time at least \$250,000,000 of war claims, not included in the statement of the ascertained debt of August 31, 1865, and a large amount of pensions to soldiers and sailors were paid off.

He showed also that while this rapid reduction of the principal and interest of the public debt was being made, the Republican party had reduced the annual internal-revenue taxation about \$262,000,000 and the customs taxation about \$75,000,000, or an annual total reduction of taxation of \$337,000,000.

Since my predecessor presented what he aptly termed "the glorious financial record of the Republican party," the success of this policy has been still more marked. Resumption and a sacred main-

tenance of the faith of the nation have given the United States a credit never before vouchsafed to any people, and has secured not only a rapid reduction of the principal of the national debt but also a more rapid reduction of the interest, thus demonstrating that honesty and good faith are profitable to nations as well as individuals.

The Forty-sixth Congress expired on the 3d of March, 1881, without having enacted into law the bill which provided for funding maturing fives and sixes into \$400,000,000 five-year 3 per cent. bonds, and \$300,000,000 one-year notes. This failure was caused by an attempt of the majority to include in the funding bill provisions of law which the President regarded as unwise and improper. The successful manner in which Secretary of the Treasury Windom met the exigency soon demonstrated that it was fortunate for the Government that the funding bill proposed by the majority of the Forty-sixth Congress did not become a law, for if it had the Government would have been obliged to go into the market and purchase, at whatever premium holders might have seen fit to demand, a large part of the \$151,000,000 of bonds called and paid during the past year, and would have found itself again, perhaps as early as December, 1883, with no portion of the debt subject to call for two years and a half.

When the Forty-sixth Congress adjourned there were outstanding \$670,876,500 of bonds, bearing 5 and 6 per cent. interest, which would be subject to call and payment in May and June, 1881. As no means had been provided for their payment, the Government would be under the necessity of continuing to pay 5 and 6 per cent. interest for another year unless some arrangement could be made to reduce the interest. This was done by Secretary Windom, and an arrangement entered into with the bondholders by which they consented to the continuation of their bonds at the pleasure of the Government at 3½ per cent. interest. There was an attempt to criticise this wise and commendable action of Secretary Windom by Democratic organs and leaders, but the almost universal voice of approval which went up from the people soon stifled the voice of disapproval. By the policy of Secretary Windom over \$10,000,000 was saved in annual interest; and, more important still, over \$575,000,000 of the bonded debt was left subject to payment at the pleasure of this Government.

As the result of this wise treatment of the public debt there was a reduction in the principal of \$151,684,351 during the fiscal year ending June 30, 1882, \$284,337,286 since February 1, 1880, and \$1,070,776,968 since August 31, 1865, the reductions of the several fiscal years being as follows:

1866	\$120, 395, 407	1876	\$29, 115, 830
1867	127, 884, 952	1877	41, 649, 909
1868	27, 297, 799	1878	19, 893, 151
1869	48, 081, 540	1879	2, 967, 375
1870	101, 601, 916	1880	74, 650, 600
1871	84, 175, 888	1881	84, 425, 350
1872	97, 213, 538	1882	151, 684, 351
1873	44, 318, 470		
1874	1, 312, 907	Total	1, 070, 776, 968
1875	14, 107, 984		

The following official statement of the public debt June 30, 1882, will show its present character:

Debt bearing interest at 3 per cent. (Navy fund)	\$14, 000, 000
Debt bearing interest at 3½ per cent., redeemable at pleasure of Government	460, 461, 050
Debt bearing interest at 4 per cent., redeemable July 1, 1907	739, 349, 350
Debt bearing interest at 4½ per cent., redeemable September 1, 1891	250, 000, 000
Total interest-bearing debt	1, 463, 810, 400
Debt bearing no interest	438, 241, 788
	1, 902, 052, 188
Deduct cash balance in Treasury, (greenback redemption fund)	140, 604, 474
Net debt	1, 751, 447, 714
Annual interest	54, 777, 605

A comparison of the debt statement of June 30, 1882, with the debt statement of August 31, 1865, will show at a glance the wonderful achievement of seventeen years of Republican policy. There has been a reduction in interest-bearing debt of \$937,719,894, and in annual interest of \$96,199,893. About \$56,000,000 of this saving of interest has been in consequence of the reduction of the principal of the debt, and about \$40,000,000 has been in consequence of the improved credit of the Government. The average interest on the debt at the close of the war was 6.6 per cent.; the average interest to-day is 3.8 per cent. The debt per capita at the close of the war was \$78.25; the debt per capita to-day is about \$30. The annual interest per capita was \$4.29 at the close of the war; to-day it is about \$1.

But this is not all. A provision in the bank-extension bill, which will soon be a law, authorizes the Secretary of the Treasury to exchange new bonds, payable at the pleasure of the Government, bearing only 3 per cent. interest, for the Windom's bearing 3½ per cent., on the sole condition that the new three's shall be called last of this series. There is scarcely a doubt that \$400,000,000 of new three's will be taken in exchange for a similar amount of 3½ per cents, and thus \$2,000,000 more be saved in interest by this arrangement, an achievement which has been made possible by the good faith shown by the Government in its treatment of the public debt.

And now, the bill under consideration authorizes the Secretary of the Treasury to issue 2 per cent. bonds or certificates in exchange for the three-and-a-halves or threes, payable at the pleasure of the Gov-

ernment, on the condition that they shall be called last in these series.

Whatever may come of this provision looking to a 2 per cent. bond, there can be no question that the 3 percents will be taken, and thus the Government of the United States will occupy the highest plane of credit of any nation in the world, and will be the first to place a large loan, payable at the pleasure of the Government, at the low rate of 3 per cent. England's consols, an interminable bond bearing 3 per cent. interest, are rarely at par; and a long bond would be readily taken at least half of 1 per cent. less than a bond payable at the pleasure of the issuer. The French 3 percents were sold at 15 per cent. discount.

The United States is almost the only nation in the world which has reduced her debt during the past fifteen years, and the only nation which has steadily reduced taxation and interest. The following table will show the debt and annual interest burden of the leading nations of the world:

Nations.	Debt.	Interest.
France.....	\$3,829,982,399	\$138,000,000
England.....	3,766,671,000	113,000,130
Russia.....	3,318,953,000	175,000,000
Spain.....	2,579,245,000	95,000,000
Italy.....	2,540,313,000	115,000,000
Austria.....	1,881,115,350	80,000,000
United States.....	1,751,447,714	54,777,895

It will thus be seen that the debt of the United States per capita is less than half of that of France and one-third that of England, and the annual interest of the debt of the United States per capita is one-third that of France and nearly one-fourth that of England.

It is to be borne in mind that the United States has within seven years paid not only the interest and more than \$1,000,000,000 of her public debt but also at least \$250,000,000 of war claims not included in the debt statement of 1865, and more than \$500,000,000 of pensions to her soldiers and sailors, the annual pension payments being as follows:

1861.....	\$1,034,500	1872.....	\$28,533,402
1862.....	852,176	1873.....	29,359,426
1863.....	1,078,513	1874.....	29,038,414
1864.....	4,985,473	1875.....	29,456,216
1865.....	16,347,621	1876.....	28,257,395
1866.....	15,605,549	1877.....	27,963,752
1867.....	20,936,551	1878.....	27,137,019
1868.....	23,782,386	1879.....	35,121,482
1869.....	28,476,621	1880.....	56,777,174
1870.....	28,340,202	1881.....	50,059,279
1871.....	34,443,894	1882.....	65,000,000

When it is remembered that at least \$1,000,000,000 was raised by current taxation and expended for war purposes during the four years of rebellion, and that \$1,750,000,000, in addition to as much more for interest, has been paid since the suppression of the rebellion for war claims, reduction of the principal of the debt, and pensions, without seriously retarding the progress of the nation in population, wealth, and prosperity, it is no wonder that the distinguished English statesman, Premier Gladstone, should declare on the floor of the House of Commons that the wisdom and success of the financial administration of the Government of the United States challenged the admiration of the world.

Already we can clearly see that by a continuation of the Republican financial policy within twenty-five years every dollar of the immense expenditure necessitated to preserve the life of the nation can be paid. The average annual reduction of the principal of the national debt since the close of the war has been about \$60,000,000, the largest reduction being in the fiscal year just closed, and the next in 1867; and this rate of reduction in the future will extinguish the interest-bearing debt by the time the last series of bonds become payable, in 1907.

Only one thing can prevent this welcome consummation, and that is the success of the movement to abolish the internal tax on tobacco and abolish or reduce the internal tax on liquors. There should be, there will be a reduction of several millions in the customs revenue by the revision of the tariff, the reduction coming mainly on necessities of life, like sugar and molasses, where the home production is so small as to forbid the regulation of their cost by home competition, and where every cent of duty is necessarily added to their price.

The receipts and expenditures of the fiscal years ending June 30, 1881, and June 30, 1882, were as follows:

RECEIPTS.		
Sources.	1881.	1882.
Customs.....	\$198,159,676	\$219,678,698
Internal revenue.....	135,264,385	*146,147,976
Miscellaneous.....	27,358,231	37,634,610
Total.....	360,782,292	403,460,284

*About \$85,000,000 from liquors, and \$47,000,000 from tobacco.

EXPENDITURES.

Sources.	1881.	1882.
Ordinary.....	\$128,144,867	\$122,630,000
Pensions.....	50,059,279	65,000,000
Interest on debt.....	82,508,742	71,256,000
Total.....	260,712,888	258,886,000

Leaving a surplus of over \$151,000,000 for the last fiscal year which has been applied to a reduction of the public debt.

It is estimated that the expenditures for the present fiscal year ending June 30, 1883, will be about \$300,000,000, an increase of over \$40,000,000, of which \$35,000,000 will be due to the increase of pensions.

The House has already passed a bill repealing the tax on bank deposits and all the internal taxes except those on liquors and tobacco and dealers therein, and making a small reduction on the tax on cigars, which will involve a reduction of \$24,000,000 in the revenue for the present fiscal year. With a reduction of no more than an equal amount in customs duties it is inevitable that there will be a reduction in the revenue of the Government of nearly if not fully \$50,000,000. This will reduce the surplus to \$65,000,000 to be applied to the reduction of the debt.

All of the internal-revenue taxes except those on liquors and tobacco and dealers therein, involving with a few other items a reduction of about \$24,000,000, have been repealed, so that the internal-revenue receipts for the fiscal year ending June 30, 1883, without further reduction will not exceed \$120,000,000. With a reduction of \$25,000,000 in the customs receipts, the revenue for the last half of the next fiscal year will not much exceed \$180,000,000, leaving a semi-annual surplus of only \$30,000,000 to be applied to the reduction of the principal of the debt.

If the proposition to abolish the tax on tobacco and fermented liquors, (from which the Government received about \$62,000,000 the last fiscal year,) which proposition received the unanimous support of the Democratic side of the House, and which lacked only four votes of success when the internal-revenue bill was under consideration a few days ago, should be carried when Congress reassembles next December, it is certain that it would sweep away nearly all if not the whole surplus in the fiscal year ending June 30, 1884, and a large part of it in the fiscal year ending June 30, 1883.

I am correct, therefore, in saying that the proposed repeal of the remaining internal taxes, as earnestly advocated by so large a proportion of the Democratic side, or even the repeal of the tax on tobacco, as supported by nearly all the Democrats of the House, would inevitably result in an indefinite postponement of the payment of the public debt.

Believing this, I shall earnestly oppose every proposition of this kind, and shall insist, with nearly every other Republican member of the House, that it is our duty to continue to pay off the public debt as rapidly in the future as we have in the past.

APPENDIX.

Table showing the annual receipts of the Federal Government from internal revenue and customs, and the cost of collecting the revenue from each source.

Year ended June 30—	Internal revenue.		Customs revenue.	
	Revenue.	Expenses collecting, per cent.	Revenue.	Expenses collecting, per cent.
1858.....			\$41,789,620	6.94
1859.....			49,565,824	6.85
1860.....			53,187,511	6.27
1861.....			39,582,125	7.18
1862.....			49,056,397	6.67
1863.....	\$37,640,787	0.29	69,059,642	4.60
1864.....	109,741,134	0.23	102,316,152	4.09
1865.....	209,464,215	0.18	84,928,260	6.39
1866.....	309,226,813	1.87	179,046,651	2.98
1867.....	266,027,537	2.77	176,417,810	3.26

Rivers and Harbors.

SPEECH

OF

HON. ROBERT T. VAN HORN,

OF MISSOURI,

IN THE HOUSE OF REPRESENTATIVES,

Thursday, June 15, 1882,

On the bill (H. R. No. 6242) making appropriations for the construction, repair, and preservation of certain works on rivers and harbors, and for other purposes.

Mr. VAN HORN said:

Mr. CHAIRMAN: The question of the improvement of the internal navigable waters of the United States has assumed an importance in the extent and cost of the work required as to mark a new era in our policy in that direction. Once they were regarded as local, and only the tidal waters were treated as national. While the situation is not reversed, the former have assumed the leading place in magnitude and cost. The food supply as to surplus is now where, when Henry Clay inaugurated the American system, the wilderness was unbroken. The heart of the nation is now in the valley of the Mississippi, and the policy once adapted to the coast-line is no longer applicable.

Other changes have tended to transform our policy in regard to the sea-ports of the country. Steam has increased the size and draught of vessels until the deepening of our harbor entrances has become to them a vital question. We cannot longer legislate for sections in this respect. If we must have deep harbor approaches, we must have deeper rivers upon which to float to the great vessels cheap and abundant cargoes. Commerce always cheapens by abundance, and competition to be successful and desirable must be based upon cheap bread—not upon cheap labor. The economy which renders it impossible for labor to acquire independence at forty-five years is a false one, and in the end brings social disaster.

There is another view of this question, as affecting the right of the people of the West, the agricultural people, to demand legislation in this direction. We are met with the policy of protection to the industrial interests of the country engaged in manufactures, and skilled labor employed in the useful arts. Many of us in the West recognize the justice and policy of this demand, and for the last twenty years our tariff laws have given the home markets to this class of industry. The most efficient protection that can be given to the great agricultural interests of the West—the labor and capital employed in the development of the soil—is by cheap transportation. There is nothing offered for sale that represents more labor value in proportion to price than a bushel of wheat. It is nearly all labor. Cheap transportation, then, is one form of protection, because it enables us to secure the highest possible price for the labor bestowed upon the product. As now, it often costs two bushels of corn to get one to market. If by the improvement of our natural water-ways we can send two bushels at the cost of one, the situation is reversed; we get double the money for our corn. If this is not protection direct, it is the same in effect, and by means entirely in harmony with the fundamental methods of civilization—the development of natural facilities by the application of intelligent labor. And it is in harmony with the elementary duties of government—the improvement of natural resources for the uses of man.

Again, we have the right to demand it, because out of the common fund of all the people—the lands of the nation and taxes—vast sums have been expended in aid of capital in the construction of our interstate and transcontinental system of railways. In this way the agricultural interest has furnished the basis of credit for the immense loans that capital secured, and the fruits of which it now enjoys, to build these lines. I am not referring to these expenditures in any fault-finding sense. For many of these grants I have voted as a member of this House, and as a citizen I have given the full measure of effort and support wherever I could toward the construction of these lines of traffic, and am ready to do so again when necessary. Their influence has been for progress, and the results from their construction and operation are among the greatest of the great wonders of the last twenty years.

But I do not think we ought to stop here. Nor, strongly as I would deprecate hostile legislation, and little sympathy as I have with the crusades often preached against these greatest of all modern agents of material progress, yet they are not all that we require or all that we should foster in the way of transportation. Artificial as they are, they must be owned by corporate and private interests, controlled primarily for individual profit, and at times are felt as oppressive upon the interests of the people—as to the masses and very largely so against localities. The law of competition in their case acts unequally—where it is against rival lines to the benefit of competing points, but where free from this against the people having no other channel of transport. And always the rail is owned by a close corporation—its use paid for by the people.

But the river is free. Any man who chooses can launch his craft

upon its waters and float to the sea or to the interior markets. Its dangers are removable, its obstacles avoidable, and its benefits accessible to all. It is a gift of nature, free of tolls, unvexed by management, and supplies transport at the lowest cost. If industry is protected by customs duties, if railroads have been built by grants of land and national, State, and municipal taxation for the benefit of mechanical and manufacturing industry and corporate capital, surely the improvement of the natural water-ways of the nation for the benefit of agricultural industry, general commerce, and the cheapening of food for all is not only a proper subject of legislation but a duty involving the most enlightened statesmanship. It is but meeting out to the great agricultural interests of the nation the equal measure of favor it has in common with all others bestowed upon its sister interests. We ask nothing but what we concede; we require but a hundredth part of what has been given.

To-day we point to our national prosperity with a just and pardonable pride, and to the balance in exchanges upon which this prosperity is based. And, when we come to trace its course, we find them in the markets abroad for our agricultural products. While our manufacturing industries have thrived and grown vigorous and strong upon the home market; while the great railway lines have paid princely returns upon their traffic, and the national Treasury grown pléthoric upon abundant revenues paid by the great consuming population of the nation, we all acknowledge that it has been due to the market abroad for our soil products, and upon their abundant supply to the world's markets. Yet amid all this prosperity of skilled labor, corporate wealth, and fat revenues, this interest has not shared in it as it should. The one interest upon which all others depend has alone fallen short of its just reward.

And why? Simply because of the absorption of so large a portion of products in the cost of carriage to market. It is not their fault, nor am I here to complain of oppression on the part of the management of transportation lines. One of the causes comes from the distance the products of the West have to be carried over these artificial lines. The corn of my constituents has to pass over 1,200 to 1,400 miles of rail to reach the chief seaboard markets. The cost of this comes out of the profits of the farmer and is paid by the buyer of his food products. Now, give to us unobstructed rivers and we can send this food to the Eastern market at from 100 to 200 per cent. less cost than now. And this reduction in cost will be shared, as the high price is now, by the farmer and the consumer. As the burden is now upon both, the benefit will be shared by both.

Again. For many years to come we must as now depend for the balance of trade in our favor upon the shipment of our agricultural product. To market it we have to compete with the farms of all the world. In seasons of abundant crops abroad the high price of transportation makes the foreign market unavailable. Reduce the cost and we can command the market to a larger degree. To-day we cannot command the British market from cost of transport. If we could deliver our crops at tide-water to-day at the rate possible by a full channel of water we could undersell our rivals. And because we cannot gold is going out of the country in a volume equal to the product of our mines. It is thus demonstrated that the cheapening of transportation is the most important factor in the prosperous movement of our foreign commerce and financial exchanges. It is not sectional, but in the highest sense national in its importance.

And now I come to another consideration. Your table, Mr. Chairman, is covered with bills and petitions looking to this revival and fostering of our ocean commerce. The demand is made for subsidies in the shape of mail pay and other means for steamship lines under our own flag upon the ocean. For one I recognize the force of these appeals, and will do all I may to advance their object. But when built, when placed upon the high seas, where are you to look for cargoes? The development of our manufactures forbids that they shall come from them. It is to attempt the opening of new markets for them that is the incentive to this policy. You must look to the soil products for these cargoes, so that our flour, our pork, our beef, and food products of all kinds shall go out by these proposed lines for introduction to the markets of the globe. And how can these be secured so well as by lessening their cost on shipboard? Give us unobstructed rivers, open out the Missouri, the Mississippi, the Ohio, and their great navigable tributaries, reduce, as it would, the cost of transport to the sea from 100 to 300 per cent., and your ocean steamers would not only have full and profitable cargoes but they would be multiplied in number beyond your most sanguine hopes.

The problem of the improvement of the navigation of the great rivers of the United States is one involving elements as various as the character of the rivers themselves. What is suited to one is not adapted to another, and the obstacles in one differ from those in another. For example, let us take the Mississippi and its two great tributaries—the Missouri and the Ohio. What is adapted for the Missouri is not applicable to the Upper Mississippi and the Ohio. And when I refer to the "Upper Mississippi" I mean above the mouth of the Ohio, and the "Lower Mississippi" that portion below that point. And what is practicable for the Upper Mississippi, the Missouri, and the Ohio is not so for the Lower Mississippi. In the former the difficulty is not enough water for continuous and permanent navigation; in the lower river there is too much water.

The different methods demanded is from the differing character of the rivers. In the Ohio and Upper Mississippi the beds of the rivers

are rocky and gravelly, the shoal places being unchangeable from that fact. The problem is to remove these rocky and gravelly shoals and to concentrate the water of the river in defined and permanent channels. The banks, too, are permanent, owing to the tenacity of the soil, and but little subject to abrasion. This is demonstrated in the navigation of those rivers by the fact that pilots run their boats by landmarks from year to year; while in the Missouri they run by the surface indications and bends of the river, landmarks being unknown. The Missouri, from the Yellowstone to the mouth, is an inclined plane of sand, not a rock or gravel shoal in the entire distance, nor a rapid. Its banks are for the entire distance alluvial and are abraded with the smallest force of current and rapidly dissolved. The problem from this fact is not to deepen the channel by removing bars, rocks, or deepening shoals after the method in the other rivers, but to prevent abrasion and confine the waters at given points to a narrower channel, when it deepens itself.

It is not my purpose to be tedious as to the characteristics of the river, only to state them broadly, so as to show the methods to be employed. The same plan of appropriations that is employed in the Ohio and Upper Mississippi is not, for this reason, applicable to the Missouri. In the former given points are selected and appropriations made. The same plan has been adopted heretofore in the Missouri, and no good results have followed. The present bill is the first that recognized the true method, and I take this occasion to thank the Committee on Commerce for its wise and statesman-like action. The appropriation is in bulk, to be applied continuously, so as each year to complete a section of the river in a permanent manner.

Allow me, Mr. Chairman, to briefly sketch the character of the Missouri River. From its sandy bed and the alluvial character of the great valley through which it flows its course is serpentine, from bluff to bluff. When the current strikes a bluff, where it meets the rocky barriers that underlie all the bluff formations of that valley, it shoots off by a sharp curve across the alluvial bottom-lands until it impinges on the opposite bluff, to repeat the same indefinitely.

Now, the fact is, that where the river washes the base of a bluff it is narrow and deep, with abundance of water in the channel for the heaviest transportation possible to the business to be done. But when it leaves a bluff to cross the bottom to another bluff, by the abrasion of the banks it is widened, sometimes from 1,200 to 1,500 feet under the bluff to a mile and a half on bottoms. The enlargement of the channel retards the current, creates eddies by the friction interposed by the shoaling process, precipitating the sand and soil held in suspension, and bars and shallows are the result. It is a curious fact that this law of the river results in giving to the river one general feature that characterizes its entire course. This is a succession of pools along the bluffs, with shallower channels connecting these pools, the pools overlapping or extending uniformly above the point of connection with the cross channels.

Now, the problem is to prevent the excessive widening of these cross-channels, or to confine the abrasion within limits that will produce a depth of channel adequate to the demands of navigation. For example: if the pools have at low water a depth of 20 to 30 feet, as they have as a rule, with a width of 1,500 feet, by confining the cross-channel of a mile or a mile and a half with 4 feet water to half a mile, we have a channel of 12 feet—the problem is solved. I use these figures as comparative.

Now, can this be done? The engineering skill of the country says it can, and the practical experience and observation of river men agree with the engineers. In fact they see it done in detail every year.

The real facts which call for the improvement of the river arise from the irregular operation of the same principle. If the snags, steamboat wrecks, and other obstructions in the channel of the Missouri had been methodically deposited they would have solved the problem long ago, and to-day we would have had deep and permanent navigation in the river. That this is not overstating the case scores of examples exist along its course where a lodged tree or a sunken boat has radically changed the course and character of the river for miles, in instances improving the navigation of the river exactly as the engineers now propose to do; but when the elements were adverse, carrying destruction and devastation in their wake. In fact it is the accumulated evidence afforded by these accidental obstructions upon which the engineers have based their plan of improvement.

There is only one thing to do to prevent the unnecessary washing of the banks at these points of crossing referred to, and the river will take care of itself. If the banks of the Missouri were of the character of those of the Ohio, with its bed of sand, it would have always been the finest navigable river of the continent. Facts exist all along its course for a thousand miles that demonstrate that even its debris, where lodged favorably by accident, has done just what it is proposed to do under this appropriation. I cannot state it more simply or more forcibly than by saying that it is proposed to follow the example of the river itself in these improvements. There are places in the river to-day that if the snags in one bend were deposited systematically along a few hundred feet of cross-channel, boats for fifty miles would find at all seasons a depth of water ample for all purposes of navigation.

I think I have stated the elements of the problem involved in the

improvement of the Missouri River sufficiently broad to give the House an idea of the plan, and why the appropriation asked for has been given in bulk to be expended, not in removing bars, rocks or shoals from the channel, but in controlling the vagaries of the current or the waters, and allow them to do at exceptional points exactly what they do in the general channel of the river. There is not a single feature of the river proper to be changed, no interference with its laws or any of its peculiar characteristics. It simply is proposed to leave it as nature would have it, if its banks had been less alluvial or capable of a little more resistance to the abrading force of its waters.

The problem, as an engineering one, is based upon the true principle of aiding nature, rather than resisting her forces. It is proposed to let the river take care of its own improvement. Its waters is the force employed. It is not proposed to provide new banks or confine its waters within mud walls—only to concentrate at the exceptional points its waters, that the volume may as elsewhere deepen their own channel.

It is not my purpose to burden the House with statistics, but as there should be well-grounded reasons of policy in all expenditures of public money, it may be proper to state that the valley drained by the Missouri is in extent and fertility the most important of the continent, and although new in development it now comprises nearly five millions of people, and increasing faster than ever in its brief history. Your census returns show that it grows nearly one-third of the grain product of the United States, its aggregate crop being over 600,000,000 bushels. It had 12,365,300 farm animals, and contributed to the internal revenues \$10,000,000. Figures such as these are eloquent in argument for the policy of this expenditure, and the nearest portion of this vast productive area is a thousand miles from present seaboard markets by rail. This crop last year paid an average of 35 cents a bushel by rail to the seaboard. An experimental season of shipments by an average river sent it to sea at 15 cents, a difference in favor of the river transport of 115 per cent. If the Government can find justification in giving away in lands and bonds more than \$500,000,000 to build railroads to carry these products to market at 35 to 50 cents, and return the products of industry to the farms at corresponding rates, how can it refuse to aid by the expenditure of \$50,000,000 in all to insure the permanence of the 15 cent rates? And the western rivers can be permanently improved, all of them, for less than that sum, and in this I include the three great rivers and their important tributaries.

I present these facts as a sufficient argument against all the unconsidered objections made against the improvement of the river system. The West has a right to this expenditure, and having for forty years begged for it as a favor, proposes now and hereafter to take as a matter of right and by the power of votes at the ballot-box, and in this Hall. We hold the power, and are for all time the nation.

I now come to the second problem in the great river system—the Lower Mississippi. I favor the amendment providing for an outlet, and regret that the committee have not incorporated it in their bill.

I regret also, Mr. Speaker, that this question has been allowed to drift into an antagonism that demands the sacrifice of one or the other plan. There is no necessity for this, but on the contrary there is every reason why both should go together.

I have shown that the problem of the upper river was too little water; that of the lower is too much water. Is it not a common-sense proposition that you cannot treat these two problems by the one method? In the one case you have to control the water within the river banks so as to provide at shoal places a deeper channel. In the other it is to get the superabundant waters within the river banks. Will the plan of the one answer for the other? It is simply impossible, because the trouble is in the two cases directly opposite in character.

And this is well illustrated by the fact that although one year ago you appropriated \$1,000,000 to improve the Lower Mississippi by the method proposed in the bill, the only money spent has been in preparation. The real work has not been prosecuted from the fact that the floods have prevented getting at the river within its banks at all. You cannot use your one million, because the high waters have prevented its expenditure. How long will it take to expend the additional four millions provided for in this bill? Taking average seasons, and you cannot do it in five years.

Now, I am not to be drawn into antagonism to the plan of the committee's bill, because in practical operations it is as yet an experiment; and in the sense of results the plan I favor is to be tested by trial. What I object to is that in any plan based upon scientific theory or practical trial it should be assumed that one contains only wisdom and all knowledge and that the other is the embodiment of all folly, when the truth is both have arguments in their favor. But, Mr. Chairman, the Mississippi River cannot be controlled by theories or by debate.

We know that the money already appropriated has not been expended because the flood-waters have been in the way. Now, we contend that if the river had had more discharging capacity the waters would have been within the banks and that money have been expended for the use intended. And why not open more discharging capacity? What is the cause of the overflows of the Lower Mississippi? It is, stating it broadly, because the mouths of the river are not big enough. This fact comes from two causes, the slow current near the sea, and the consequent precipitation of sand and mud

held in suspension. These causes result in narrowing the channel as it approaches the sea. The fact that by actual measurement the inflow at average floods at Cairo is 1,475,000 cubic feet of water per second, and that after receiving the waters of all rivers below, the flow at New Orleans is only 1,100,000 cubic feet per second, tells the story of the disastrous annual overflows. This surplus water must go somewhere, and the only place for it is to overflow the adjacent country. To confine this immense flood of waters within artificial walls, built of the mud the river takes up and carries down to choke up its own discharge, is, I submit, one of those stupendous follies which sometimes fascinate men merely from the fact of their magnitude and from the vast sums of money involved.

That new mouths will draw off the water just in ratio with their capacity is as plain a proposition as that a barrel of water will be depleted by opening the bung-hole. The river below New Orleans, with a fall of $1\frac{1}{4}$ inches to the mile, has a flow of 6 feet in a second. The proposed Lake Borgne outlet, with a fall of $2\frac{3}{4}$ feet to the mile, would have a corresponding increase of current and consequent discharging capacity. But only calculating the flow at 10 feet per second, with a width of 1 mile and 10 feet deep, its discharge would be 528,210 cubic feet of water per second, or one-third of the whole inflow at Cairo. But the current would be more than 20 feet per second, or a capacity nearly equal to the whole river at Cairo. The mere statement of the figures shows the ample character of the proposed outlet for the drainage of the highest flood ever known.

Why then is this self-evident plan opposed? It is upon the assumption that if you let the water out through these new mouths the channel will be shoaled. No other objection having any practical bearing can be made, or can be urged to stand a moment, in view of the difference in cost—the outlet being estimated at \$250,000, the other plan at \$50,000,000. Is the objection a valid one?

I contend that it is not only without support in fact but is based upon a false assumption as to what the outlet plan is. These outlets only propose to drain the flood-waters, not to make new river channels. When the river is within its banks now, navigation is just as desired. All the outlets propose is to keep the water from overflowing the banks. How, then, when the river is within its banks, or bank-full, in October, and at its maximum excellence for navigation, can it be destructive to navigation when, in precisely the same condition, in March or July? That is all the outlets propose to do—to keep the river at this maximum at all seasons. They are not deep enough, and cannot be made deep enough, to affect the normal channel of the river, or the quantity of water in it. Or, in other words, the channel of the outlet is 10 feet deep, while the river channel at the outlet is 100 feet deep. How is this outlet to drain the river dry, or shoal it? It simply draws off the flood-waters, leaving the normal channel unaffected. But we are not left to theory. The United States topographical engineers by measurement at crevasses have demonstrated that the operation of these openings actually deepen the channel below the point of outlet. And this is exactly what is claimed for its effect—that the river confined within its banks by its increased current deepens its channel.

It is upon this theory that the Missouri River improvement is based, and I am not illogical enough to deny the operation of the same law in the Lower Mississippi that obtains in the Missouri. But it is upon this very fact that the improvement of the navigation of the Lower Mississippi is based. It is claimed that at points where bars interfere, that by works which will confine the waters to lesser space the channel will be deepened. Now, if the water confined to the normal width of the channel on a bar deepens the water, why not the channel be deepened and improved when the whole river is confined within its banks? The statement is the answer. It is the object of all our appropriations, of all our surveys, of all our plans, to keep the river within its banks, natural or artificial. If as is contended when we build the banks higher in order to confine the water, it will deepen the channel, will not the same effect result if the waters are confined within the natural banks? It needs no argument; its demonstration is a fact known to every practical navigator of the great rivers of the West.

But this is not all. It is too late to interpose this objection on the part of those who make it. The House and the country is aware that \$5,000,000 have been appropriated and expended in deepening one of the mouths, or passes, of the Mississippi, by confining the flow of water within a narrower channel than existed at its entry into the sea. I was one that favored, as my position offered, that experiment and that expenditure, but I cannot now reverse the position I then assumed, or say that the law of hydraulics which drew five millions from the Treasury for the jetties at the mouth of the river is suspended when invoked for the main river itself.

I shall not detain the House by a repetition of facts so abundantly spread before it, nor weary it with details of facts, figures, measurements, and surveys scattered through the record of ten years of the most painstaking and exhaustive survey by the most eminent engineering ability ever undertaken in river investigation by any government in the world, but will cover it all by the broad statement that the outlet idea is supported by every observation and fact in the report of that river survey.

I beg the House to remember one fact, that the advocates of the outlet system have only assumed one thing—the mere cost of making it. Every other fact connected with it is from the highest engineer-

ing authority ever known in this country; is copied from the official report of the board of engineers of the Army of surveys and investigations made under the authority of Congress during a protracted period of ten years, embracing everything connected with the river at high and low water, as to levees and embankments, navigation, currents, the bed of the river, its floods, and all phenomena. We assume nothing; we have no theories, no experiments, no hypotheses, simply the fact that water runs down hill, that it is not compressible; these re-enforced as to results by ascertained facts by the most thoroughly applied scientific methods.

And what is the plan here proposed? Let me state it simply. As now, the river has below New Orleans a current that moves over a bed with a fall of $1\frac{1}{4}$ inches per mile. The distance is 120 miles. Ten miles below New Orleans the Gulf of Mexico approaches to within 5 miles of the Mississippi by an arm known as Lake Borgne. The river thus reaches the Gulf level at a point 110 miles less than now, or in 5 miles we reach the same level that the river now does in 110 miles. Gentlemen can discount the immense drainage capacity of 13 feet fall in 5 miles in the one case, and the same fall in 110 miles as now, in the discharge of these surplus waters. That is all there is to the proposed Lake Borgne outlet.

Now, the fact to be ascertained is, will it prevent overflow to be restrained or confined by artificial banks? The plan has been tried, and has failed. By both experience and theory it will require artificial banks to be constructed from four to ten feet high for a thousand miles. Is it practicable as to money cost? And if so, will it hold the water? Both must be answered in the negative. We have found that it is difficult to confine even canal waters by artificial banks. How, then, the mighty floods of the Mississippi?

Again, the experience of the ages is that just as you raise the banks of a river you decrease the force of its current, until, as in the case of the river Po, in Italy, the river bed is above the level of adjoining lands. That river, after centuries of leveeing, now runs across the low lands on a ridge. But by keeping a river within its natural banks deepens its channel, cutting out its bed to the proper angle of fall to the sea. It requires no science to know this; every wash-out in the farmer's field illustrates and demonstrates it. The only question of a practical nature in this connection is, can you get outlet enough? I have shown you can.

Mr. Chairman, the very last men who ought to object to the proposed outlet are those intrusted by Congress with the improvement of the Mississippi. They cannot oppose it and escape criticism. They tell us that they have not spent the money appropriated last year because the high waters prevented. How are they going to spend the four millions by this bill before next session, when four or five more will be asked? And if they cannot use it what is the need of appropriating it? Let the water out, or keep it within the banks, and they can then use the money and demonstrate their plan. Why refuse to let the water be drained off when they cannot work because it does not subside?

It has been shown by facts, in plain measured feet, that the proposed outlet cannot affect the river channel. Why not make it? It will be observed, Mr. Chairman, that these objections to the outlet are not made as formal engineering ones; they are the mere advocate arguments before the committee. There is another one used among members, but carefully kept from the record. This argument is that the outlet would injure the jetties. This is so new and novel that it is done in a whisper. The old soothsayers were said to laugh in each others faces when alone. The habit did not die with the soothsayers.

Now, I can speak on this subject without fear of criticism, for from the beginning I favored the jetties, and have not changed. They do not need this disingenuous argument, nor, even if they did, are they sacred or of more importance than the valley of the river. Let us look at this for a moment. It is shown that the river is a hundred feet deeper than the outlet at the point of junction. As the jetties are only twenty-four feet deep there is abundant water for them. We have shown that 1,100,000 cubic feet of water per second passes the point of the proposed outlet. The same high engineering authority tells us that only 83,000 cubic feet per second enters the pass in which the jetties are. So that there is all the jetty pass can carry and a million cubic feet to spare. No wonder this objection passes by a breath and is carefully kept from paper. It is not discourteous to say the objection is not an honest one. It either reflects upon the intelligence of the person to whom it is made, or upon the candor of the one who makes it. No friend of the jetties will put the objection on that ground, for it at once raises the question of good faith and of their utility.

To set this objection at rest, let us refer to the facts upon which the jetty legislation was based, and those alone upon which the annual drain for keeping them open is made upon the Treasury. The jetties are based upon the simple fact that water is incompressible; that if you confine a stream of flowing water, of say half a mile wide, so as to make it pass between walls a quarter of a mile apart, the water will find room for its volume by cutting down its bed. That is all there is to the jetties. If the bed is of soft material, like sand or mud, it will cut it out. If it is hard clay or rock it will not, and then it makes a dam. Now, the best advice I can give those who urge this objection against the outlet is to be very careful how they handle the subject, for if they once let go of the theory on which

they got the money to build the jetties, they turn them into a dam, and Congress may discover that a dam raises the flood-line of the river, and vote money for the outlet to carry off the surplus waters.

The truth is, Mr. Chairman, that were it not for the large appropriation to be expended under the present plan, the outlet would be urged as the very solution for the annual expenditure in dredging out the channel within the jetties. As an original and constant friend of the jetties I enter my protest against the covert way in which they are being assailed. Their only safety against future attack is in the opening of the proposed outlet at Lake Borgne.

Mr. Chairman, why should we hesitate over so plain a proposition as this? If the outlet is the useless thing claimed, why not dispose of it? By this amendment not one dollar is to be paid if it is a failure as an improvement of the river. To try it can do no harm, as has been shown. If it does what is claimed for it you have results for \$250,000 that will cost, by friendly estimate, \$50,000,000 by the other plan. Whatever men interested may wish or desire, surely Congress can have no hostility to that result. Why, then, not place the two together and definitely solve the problem one way or another for all time, so that hereafter we may stand on the solid ground of demonstrated fact? Doctors differ; so do engineers. If a problem that involves \$50,000,000 and an annually devastated country can be solved for \$250,000 if demonstrated one way, and not a single dollar if in another way, I submit Congress cannot afford to refuse the trial. It has not the information to decide adverse, and it cannot, in justice to the people or the Treasury, refuse to test it. That is all the amendment asks; but the country will sooner or later exact a better reason for refusal than has been given.

Rivers and Harbors.

SPEECH

OF

HON. THOMAS WILLIAMS,

OF ALABAMA,

IN THE HOUSE OF REPRESENTATIVES,

Friday, June 9, 1882.

On the bill (H. R. No. 6242) making appropriations for the construction, repair, and preservation of certain works on rivers and harbors, and for other purposes.

Mr. WILLIAMS said:

Mr. CHAIRMAN: Entering the borders of the State of Alabama on her eastern line, and about a hundred miles or more distant from the angle of her northeastern boundary, is the beautiful Coosa, whose limpid and laughing waters uniting with those of other streams traverses the remainder of her extended length in a southwestern direction; when nearing her southern border the elements of this grand stream, affording a route of well nigh a thousand miles of attainable navigable waters, are lost in their minglings with those of the classic bay of Mobile.

The Tallapoosa, the improvement of whose navigation is provided for in this bill, and no inconsiderable feeder of the great water route alluded to, enters the State on her eastern border about one hundred miles or more south of the point of advent made by the Coosa; and flowing in a somewhat parallel or southwestern direction with the other stream for about two hundred miles or more, effects her confluence with the Coosa in a locality only ten miles away from her interestingly attractive and queenly capital, the city of Montgomery. The union of the waters of these two beautiful streams, in vales almost as enchanting as those of sweet Avoca, form the magnificently imposing river bearing the name of my State.

Rising in the mountains of Saint Clair, in a locality a little south and east of a central position of North Alabama is the Cahaba; and flowing southwest through the county of Shelby it enters, on her northern boundary, the county of Bibb; traversing her limits it passes out of her borders in the southwest corner of the same, and varying but little in its course as it flows through the county of Perry it enters that of Dallas, wherein, some eight or ten miles below the locality of the growing, thrifty, and beautiful city of Selma, its waters are swallowed up and borne onward to the Gulf by those of the grand Alabama.

The Cahaba, the improvement of whose navigation is also provided for in this bill, is an immeasurably important feeder of Alabama's great water route; a route destined to empty into the lap of her great imperial city of Mobile a wealth of the treasures of mineral as well as agricultural commerce, whose influences will awaken to new life that only sea-port city of our State; one in whose growth and prosperity is not only centered the earnest desires of all true Alabamians but the circles of whose commercial value and power widen and extend far beyond that of our own State.

Reference to the report of the Chief of Engineers of the United States Army to the Secretary of War for the year 1881 will afford abundant evidence of the almost incalculable value that the improve-

ment of the navigation of this river would be not only to the section traversed by it and to the State but to the country as well. The following brief but interesting extract from that extended report will afford an idea to the mind of some of the results to follow this long-desired and long-neglected enterprise. He says:

A survey was made in September, 1874, of that portion of the river between Centreville and its mouth, a distance of eighty-eight miles, the report of which is contained in the annual report of the Chief of Engineers for 1875.

The present survey continued the previous one from Centreville to Shade's Creek, or the north boundary of Bibb County, and included a line of levels on the lower portion to supply a deficiency in the survey of 1874, and an examination to see if any marked changes had taken place since that time.

The two together show that the river can be improved by the removal of snags and overhanging trees, construction of wing-dams and cutting through shoals, so as to give a channel of navigable width and three feet depth at low water, from its mouth up to Centreville, eighty-eight miles, at an estimated cost of \$195,000; and from Centreville up to the northern boundary of Bibb County, 23,667 miles, by locks and dams, at an estimated cost of \$382,000. The total distance would be 111,667 miles, and the total estimated cost \$577,000. The improvement would give steamboat navigation below Centreville and barge above.

There was formerly considerable commerce on the river, but the obstructions are such now that no use is made of it.

The extent of trade that would be built up can only be conjectured, but it is reasonable to suppose that it would be considerable, from the fact that the river would afford cheap transportation for about 50,000 bales of cotton valued at \$2,500,000, and return supplies of \$2,000,000; would give the shortest water route from the Alabama coal-fields to the Gulf, and would save to every consumer of coal on the Gulf coast from \$1 to \$6 on every ton of coal used by them, and probably would save \$4 or \$5 on all coal that is at present used by the United States on the coast or in the Gulf, or might be required in time of war. It would also afford an outlet for iron, building stone of excellent quality, and limestone, both ordinary and hydraulic, in all of which the country bordering the upper Cahaba is extremely rich.

To show the great benefit to the State and to the Southern coast to be derived from the improvement of the Cahaba River, I present the following brief description of the coal measure; the information being condensed from the paper of Mr. R. P. Rothwell read before the American Society of Engineers, 1873, reports of the State geologist, Birney's Hand-book of Alabama, and personal observation made during the survey.

There are three distinct coal basins in Alabama, namely, the Warrior, Cahaba, and Coosa, which, from the geological structure, we are compelled to conclude were once continuous. It is to the central member of the group that our attention is especially directed, which, on account of its being the most southern, most accessible by water navigation, and presenting the greatest variety, as well as the best quality, of coals, will undoubtedly become, in the event of the Cahaba River being improved, one of the principal coal-producing districts in America, and until the river is improved the Cahaba coal-field will probably remain untouched.

In the southern portion of the field reached by the present survey the measures are regular, with a width of about twelve miles and an inclination of 6 degrees to 10 degrees on the western limits, 12 degrees to 15 degrees on the Cahaba River, in the neighborhood of the Lily Shoals, and increasing rapidly, until toward the eastern limit the rocks are dipping from 45 degrees to 75 degrees, becoming vertical in a few places.

The field is limited on its southern and eastern side by the fault referred to in another part of this report, which cuts off the coal measures and brings to the surface the Silurian strata belonging 7,000 to 8,000 feet below them. The greater inclination of the Cahaba beds causes them to outcrop within a limited area, and as there is a greater total thickness on the eastern and southern sides, as there are a greater number of beds and greater variety of coals than exist in any part of the Warrior or Coosa basin.

From the topographical features of the country a railroad crossing three fields would necessarily be graded considerably above the streams, and therefore the coal would have to be raised by vertical shafts to the level of the road, thus greatly enhancing the cost of mining, and there would be less inducement to the opening of the lowest water level, a difficulty done away with by the improvement of the river. The surface is everywhere, as before stated, covered with a virgin growth of yellow pine, chestnut, and oak, together with other valuable timber.

The cost of mining will vary at the different veins according to the thickness, amount of shale, nature of roof, location of beds, &c., but \$1.50 per ton (Professor Smith, State geologist) will cover all expenses, including interest, wear and tear of improvements, &c. This is about the cost per ton at the Pratt Mines. The cost in barge will vary from \$1.50 to \$2, and with the river made navigable, transportation to the Gulf will not exceed 75 cents, thus enabling the coal to be put upon the Mobile market at a cost not exceeding \$3.

The incalculable benefit of improvement of the Alabama system of rivers, and especially those flowing through the coal fields, is clearly shown by the coal famine and the exorbitant prices (as high as \$13 per ton) that have prevailed here and elsewhere throughout this State and the extreme South during the present season, 1880 and 1881.

When, sir, we are thus informed from high scientific and official sources that this central district of Alabama's group of coal-fields is, on account of its being the most southern, most accessible by water navigation, and presenting the greatest variety as well as the best quality of coals, undoubtedly to become, in the event of this river being improved, one of the principal coal-producing districts, not in Alabama alone, nor yet in the South alone, but in America, and that until this river is improved, this principal coal district of America will likely remain untouched; and when we are informed from the same high source of the wealth of iron and valuable timber abounding in that region, what need is there for anything more to be added in demonstrating beyond cavil the indispensable necessity of this work to the Government and the country?

Mr. Chairman, such enterprises as these present more than a pleasing view to those who study and pursue the advancement of their country's material welfare. Sir, the county of Bibb, of my State, possessing this untold, locked-up wealth, bears the immortal name of one who was honored by the State of Georgia with a seat in her Legislature in the days of his earliest manhood; afterward by that great Commonwealth, the mother of my State, sent to these Halls as her Representative upon this floor when his age had scarcely rendered him eligible for that position; who, notwithstanding his youth, came within a few votes of being elevated to the high office of Speaker of this House; who was afterward elevated by Georgia to the high distinction of her Senator in the other end of this Capitol; who resigned that honored position and was sent by President

Monroe to Georgia's fair daughter as her first and only Territorial governor, for he soon ushered her from that condition to the prestige of a State, then became her first State governor; and I feel that I may safely say in her great bereavements occasioned by the loss of her gifted and honored sons none was ever more keenly and lastingly felt than the one wrought in the removal through death of Governor William Wyatt Bibb ere he had attained his twoscore years. Five noble brothers accompanied him to that State, one of whom was afterward made her governor. And there yet lingers upon the earth to bless mankind his honored brother, Judge Benajah S. Bibb, who has passed his fourscore and half of a decade of years, and though standing in the fast-receding twilight of life is blest yet with the exercise of those high intellectual gifts with which a kind Providence has so generously endowed him—gifts used by him in his long and eventful life alone in those causes and methods having for their aim the happiness and well-being of his fellows and the glory and honor of his Maker. In the judgment of all who know him his great usefulness to his fellow-men, his sterling worth of character, his exalted Christian piety, and irreproachable life would entitle him, were not the day of miracles at an end, to a return of Elijah's chariot, and its uses in his exit from this earth.

The noble citizens of this county bearing that honored name may well be proud of it. They should be equally gratified in the knowledge of the fact that, rich in virtues and attributes treasured so dearly by the heart as is that honored name, nature has endowed her high lands and cliffs in their ruggedness, her valleys and coves in their beauty and productivity, with a wealth of the material substances of the earth, vying in their corresponding richness with that of her inspiring name. Proudly do I congratulate them upon this great Government at last having outstretched the strong hand of her powerful and sustaining aid in behalf of the development of those hidden treasures. The improvement of the Mobile Harbor, the opening up the navigation of the Alabama, the Coosa, and the streams in Georgia forming the Coosa, and their connections with the waters of the great Tennessee River became the settled policy and established purpose of this Government decades of years ago.

The fact that this work has not been completed before this time stands as a signal rebuke to that spirit of laggardness and partiality already too long and shamefully manacled the giant resources of this State, holding back her growth, development, and prosperity, until to-day, instead of displaying the attainments she would have achieved, she presents the comparative stature of a dwarf, although three score years and more ago she doffed her territorial mantles, and, attired in the robes of a State, assumed her place in the great sisterhood of this Union. This work, to-day so tardily progressing toward what would be its remote completion, if the future is to be imbued with no more alacrity, progress, and fairness than has characterized her past, is to result in no less than unfettering boundless resources of mineral, manufacturing, and agricultural wealth, enriching her commerce so vastly, building up her waste places so adorningly, and making her wilderness to blossom as the rose so profusely, as will redound in a grandeur of marvelous unfoldings and prosperity which can but arouse and awaken the sleeping Van Winkles in her midst, whose startling wonders at the same would provoke a similar query to the one employed by Rip, when surveying the boundless strides and achievements attained around him while in his unconscious sleep, he so naturally demanded to know, "Is this the village of Falling Waters?"

Then, sir, should we see within her borders, in lieu of her now twenty cotton factories, employing 75,000 spindles and 3,500 looms, their numbers rise into the hundreds, their spindles into the millions, and their looms into the tens of thousands; converting her annually increasing and now three-quarter million bales cotton crop into every conceivable phase and fabric demanded by the wants or tastes of the world, thereby gravitating permanently in her midst this home-accumulated and should be home-retained capital, and the immense benefits to flow from such results, prominent among which would be the upbuilding throughout her limits of such attractive, enlarging, and enterprising towns as her Prattville and Tallassee, with their thrifty and well-to-do operatives, their staunch and growing progenitors and owners of these wonderful interests; the hum of whose machinery would forbid lethargy and ennui to visit, much less to abide with them; dotting her fair and gladsome face with undeserted villages, the poetry of whose lovely beauty, heart-warming hospitality, and geniality, more to be coveted than oriental pearls of priceless splendor, would awaken the strings of the muses with songs more thrilling and less sad than were those so touchingly sung by the immortal bard over the fate of the deserted, yet sweet, Auburn of other plains.

Then, sir, would we see in lieu of her now dozen iron furnaces in full blast, and affording to the world, as they are likely to do this year, near on to a quarter of a million of tons of pig-iron worth \$5,000,000, that they would be numbered by scores instead of by a dozen; that her night of gloom would be rescued from the darkness of despair by their diffused and ceaseless lights, and all of whom would essay with a giant's might in the vain effort to exhaust her exhaustless and solid mountain stores of this invaluable ore; that from whose efforts the combined outpourings in their annual tonnage yield would then stride into the millions, and whose annual

moneyed value would swell into the sum of an enormity, constituting a fund whose outlay in her midst would shower peace, plenty, and prosperity, if not wealth, upon her entire population. Her edifices of learning, her temples of devotion to the God of these untold bounties, would multiply over her surface, until her hill-tops and plains, her mountains and valleys, would stand up as an adoring assemblage of thanks and praise to the Great Giver of all good gifts for their disenthralldom from the fetters of ignorance, no less than their rescue from the influences of the evil one.

But, sir, I shall indulge with fondness the hope, the hope rising to the sublimity of a faith, a faith that will stand imperviously in the conviction that it is no illusion that we are surely and adherently entering upon the threshold of a new and marked era in these important affairs; that the spirit, progress, and enterprise which has illumined the Western wilds of our domain with cities of teeming population, net-works of universal permeation of railroads, and commonwealths in full manhood of growth and development in all the resources and attainments needful for the creation and endowment of States of giant power, is about to lay its guiding and fostering hand, its energizing and marvelous enterprise upon our long neglected section, hastening as it will to their full fruition these now snail movements in works of such stupendous importance to her destiny and to the general good of the country. The Tallapoosa, already made historic by Old Hickory in his wars with the merciless savage, once infesting its beautiful borders, and the Cahaba, leaping from its mountain home burdened with her mineral riches, will attain to a sufficient prominence among the auxiliaries in the great commerce enriching our land as shall pointedly condemn those who by their criticisms or acts would confine them to their present but little more than galvanized existence.

Upon the banks of the fair Tallapoosa, some fifty miles away from her confluence with the Coosa, have been erected massive granite buildings, the valuable and enduring material whereof was taken from her adjacent mountain sides, or from the bed of her cascades or falls whose music infuses her very air with prophetic portendings of her coming power and greatness. These permanent and imposing structures are now filled with the best of machinery and the most skillful of operatives, converting our cotton into fabrics demanded by the wants of civilization; and in their midst has arisen a beautiful town, with a growing and increasingly enterprising population, destined to make Tallassee, which is one of the gems of my State, an important Lowell, not only to the State and the South, but to the country at large.

You have only to refer to the report of the Chief of Engineers for 1881 to see the value of this appropriation to that country, to its enterprises, to its commerce, and to that spirit so needful in the South in pressing her to that front in which she is yet destined to occupy a proud position. The annual commerce to result from the opening up of the navigation of the fifty miles of this stream, extending from its confluence with the Coosa to the foot of the shoals below the town of Tallassee, will in the modest estimate of that officer of the Government amount to nearly \$2,000,000. The appropriation set apart for this work is \$15,000, not 8 per cent. upon the annual results. The entire cost of the work to that point is put down by that officer at about \$40,000. Thus it will be seen that less than 40 per cent. of the cost has been appropriated, while not a few of the appropriations made in this bill rank above 50 per cent. upon the estimates.

I cannot believe, Mr. Chairman, that this House will be influenced by anything that has been said or that may be said to the extent of engendering such an injustice as would result in leaving these rivers unprovided for and out of this bill. The admirable, the crowning advocacy of the bill and of the policy and system of the Government in this direction with her rivers and harbors, made with such marked effect and force by my friend Hon. Mr. HERR, of Michigan, on yesterday, forbids it. A proper regard for the interests of the country utterly forbids it, and fair play with even-handed justice, though long deferred, lion like, arrays itself in their pathway against it.

Sir, it is a pleasurable duty to enter upon fields of legislation silencing party strife, retiring sectional animosity, and invoking fraternity and harmonious action. Fraternity and harmony among those in authority are harbingers of concord and peace to the people. Nor can it fail to occur to the mind swayed by reason that in multiplying and strengthening the bonds of the material interests of our land we institute powerful factors in behalf of a corresponding growth and strength of the bonds of social and political feeling of the people. Such is the character and such are the influences of that legislation we are now considering. This class of legislation may yet afford the avenue through which enduring reconciliation, undeviating fraternity to the sections will yet ensue. If cheap food, cheap raiment, cheap fuel, and cheap transportation be the crowning results of wise legislation, results inspiring the blessings of fraternity, peace, concord, and plenty to the people, the South enters the lists in their behalf with a holy and valiant ambition. While her granaries, unlike those of the great West, are not burdened with food, they would prove no vain auxiliaries in a day of need. Her cotton and wool, in their superabundance, leave nudity and raggedness without excuse. Her exhaustless stores of yet undisturbed coal-fields equally forbid

unreasonable exactions for fuel; while her boundless wealth of ores, upon which transportation reclines for practical existence, proclaims that rates shall be reasonable.

Sir, when the hand of the Government shall extend alike equally its fostering care and aid to the South and North in the advancement of their material interests; when the magnanimous exercise of truth, so consistent in the vindication of the equal integrity and honor of the North and South, shall scorn to everlasting silence the venomous tongue of calumny and slander, continually reopening afresh wounds that long since would otherwise have healed; when the mantle of that charity awarded by Heaven to erring man as a needful vestment in this world of trouble in hiding from view a multitude of sins shall extend its benign folds over us all, then, indeed, sir, will we have truly retrieved the past and reassured our future upon a basis securing peace, concord, and prosperity to the people, and honor and glory to the land. Then will the vituperous demagogue have lost his occupation and be known only to be equally scorned and condemned by all. That these glorious and attainable consummations, with their rich cargoes of blessings, are rapidly nearing us is the earnest wish of patriotism, the intense desire of philanthropy, and the constant invocation of true heroism. The statesman willfully neglecting or refusing to aid in steering her prow on the line of the safety and delivery of such cargoes of priceless blessings, when rightly understood, cannot be otherwise than a pirate on deck of our mighty ship of state or a mutineer to the commands of the spirit of American liberty. Sir, in God we trust, and into His guiding hand and to His propitious breezes we consign her unfurled sails.

Bureau of Construction and Repair.

SPEECH

OF

HON. JOSEPH G. CANNON,

OF ILLINOIS,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, June 7, 1882.

The House, in Committee of the Whole on the state of the Union, having under consideration the deficiency appropriation bill for the year ending June 30, 1882—

Mr. CANNON said:

Mr. CHAIRMAN: I live a thousand miles inland, and I do not know much about ships, but I sometimes think I know possibly as much as gentlemen who make greater pretension to knowledge on this particular subject than I do. I believe it is conceded by the gentleman from New York [Mr. HEWITT] that there are thirty-eight totally worthless ships.

Mr. HEWITT, of New York. It is conceded by the Committee on Naval Affairs.

Mr. CANNON. And quoted by the gentleman from New York with approval.

Mr. HEWITT, of New York. I do not know, for, like the gentleman, I am ignorant.

Mr. CANNON. In the Forty-fifth Congress, as well as in the Forty-fourth Congress, I recollect looking upon the gentleman from New York as I should look for a beacon in the storm, for light and information touching all matters concerning the Navy. [Laughter.]

Mr. HEWITT, of New York. I beg the gentleman's pardon. I never uttered one word on the subject, either in the Forty-fourth or in the Forty-fifth Congress.

Mr. CANNON. You look wise always, and if you did not utter it, with the information we have to-day, you ought to have uttered something on the subject.

I want to say seriously, however, Mr. Chairman, simply this: that I am ashamed of this Government of yours and mine, with its fifty millions of people, that it has not even one ship, as the gentleman says, that we can protect ourselves with against the smallest powers of the world, and that we have not spent two or three millions at least to buy one that is of service for our Navy. And I was sorry when the gentleman led his side of the House for weeks against the consideration of the report from which he quotes with approval, because I want to consider it in good faith, so that we may be able to take some steps and promptly to provide ourselves with a Navy. If what the gentleman claims is true, then he ought to go a step further than to oppose the appropriation, namely, to burn down the few old ships that we now have; and he might go yet another step beyond that, and if we are to have no Navy, in the name of an economic administration let him advocate a repeal of the law which provides for a naval establishment, dismiss all of the employes of the bureau, disband the service, and legislate the whole affair out of existence. I stand ready, although I live a thousand miles inland, as I have said, to cast my vote for liberal appropriations to give a small, efficient, and effective Navy, so that we may be able at least to look the small-

est power on earth in the face without blushing. The gentleman from Georgia says that this is a great Government. We can look any power on earth in the face, and by moral force protect ourselves if we are insulted. That is all very nice, but I dare say a small, effective Navy, with good ships and guns, would greatly aid our moral force.

Mr. BLOUNT. Will the gentleman permit me to ask him how many times we have been insulted in this century by foreign powers?

Mr. CANNON. Why, Mr. Chairman, the whole country looked on a few months ago with considerable trepidation when there was even a possibility of some trouble with the little power of Chili, and our people of the Pacific coast were impressed with the belief that we were powerless to deal even with as insignificant a power as that.

Mr. BLOUNT. I never made that concession.

Mr. DUNN. Nobody was mad with Chili but Mr. Blaine.

Mr. HUMPHREY. Did not Chili give us the guano—

Mr. CANNON. I cannot yield the floor, Mr. Chairman, in this manner.

The CHAIRMAN. The gentleman from Illinois declines to be interrupted. If gentlemen desire to address questions to him they must address them through the Chair.

Mr. CANNON. I only want to say this: that pending the time, as the gentleman from New Jersey has so well said, that we may claim that we have at least one ship in our Navy which may be of some account; that for the ordinary peace uses of the nation I think we should give the ordinary appropriations in time of peace, to keep in repair these vessels that we have which may be worthy of repairs, under the discretion of the Department, until something better can be done.

Land in Philadelphia for Public Purposes.

SPEECH

OF

HON. IRA S. HASELTINE,

OF MISSOURI,

IN THE HOUSE OF REPRESENTATIVES,

Monday, June 19, 1882,

On the bill (S. No. 813) for the purchase or condemnation of land in the city of Philadelphia for public purposes.

Mr. HASELTINE said:

Mr. SPEAKER: We have been informed by the superintendent that the Philadelphia mint has a capacity for making \$77,000,000 per year. We have a mint at New Orleans, San Francisco, Carson, and Denver. The total coinage during the year 1881 to June 30 was \$106,788,940.70. We also find the total of bars manufactured during the year, \$107,292,832.29. We have the statement from the superintendent that the mint is in good condition and can do all the business necessary if relieved from small coinage.

We hope the intelligence of Congress will be such that fractional paper currency will be issued for sums less than a dollar, and legal-tender certificates or full legal-tender Treasury notes issued as currency, allowing the Government an opportunity to export the bullion as we export wheat to supply the demands of other nations. We further understand that there is now stored in the mints and Treasury hundreds of millions of dollars without use, and we see no necessity for additional facilities for manufacturing that which we do not use. This is a question of business.

There was coined at the Carson mint during the year previous to June 30, 1881, 592,189 pieces, valued at \$883,590; expenditures, \$131,037.03; average cost of coinage at that mint during the year, twenty-two cents and one mill for each piece coined. We paid \$90,476.38 for distributing standard silver dollars and \$23,763.46 for distributing minor coins during the same year. A sum of \$114,239.84 was paid by the Government for transportation. Yet these metals which the bullionists have taught the people to worship as God's money continue to accumulate in the Treasury—28,000,000 of minor coins and over \$250,000,000 of gold and silver. A bill passed this House appropriating \$75,000 for safes and storage for this metal that nobody wants.

I am opposed to building any more mints until we can utilize our manufactured coins. When legal-tender paper is worth more, when certificates issued upon the bullion are preferred, no business man can see any common sense in purchasing more grounds and erecting more buildings for mints.

A large part of the bullion coined at Philadelphia during the years 1880 and 1881 was imported. There is no reason to expect such importations in future years. We are informed by the superintendent that the Philadelphia mint is the best constructed mint in the world, and that electrical light has been introduced, which gives much relief.

We have reason to believe that by the removal of some of the

unnecessary wooden structures, so as to afford better ventilation, and by employing a less number of workmen, as there is a large accumulation of the coins for which there is no immediate demand, as certificates upon the bullion are preferable to the coin, and the use of certificates is more economical for the Government, saving expense of coinage and the wear of the coins, there would be no necessity for purchasing additional grounds, or for the erection of any additional buildings.

Why erect unnecessary buildings and construct machinery for piling up more coin, and appropriating large sums of money for safes and storage of coin we do not use? We have an assay office and unoccupied grounds and suitable buildings at Saint Louis for a mint. We have the machinery at Carson, which we can remove to Saint Louis, where the coin could be more readily thrown into circulation.

The estimated expense of running the mint at Carson is very much greater than the profits. I apprehend that by utilizing the Carson machinery at Saint Louis, and manufacturing there the smaller metallic coins, (if we are to manufacture them in the future,) where they may be used in the circulation, we may relieve to a great extent the Philadelphia mint.

We have in the mints at Philadelphia, New Orleans, San Francisco, Denver, and Carson more capacity for coinage than demand for the coins. As there appears to be a large foreign demand for bullion, and frequently bullion is worth more than coin, to supply the foreign demand, and as the policy of the Government in relation to the coinage of silver is yet an unsettled question, we see no reason for the appropriation of \$400,000 for additional grounds, and another of \$500,000 for additional buildings at Philadelphia.

The fact that large sums of gold coin and bullion amounting to about \$70,000,000 have been deposited in the Treasury for silver certificates within the last two years, redeemable only in eighty-eight cents silver coin, the fiat of the Government being taken for the other twelve cents, settles the whole question to the perfect satisfaction of all intelligent business men that the other eighty-eight cents should be fiat, that full legal-tender lawful money certificates can be issued for the bullion as more convenient in use, saving the immense expense and waste of coinage, the unnecessary purchase of grounds and erection of buildings, and the paying of \$114,000 annually to unload the coins upon the people.

The wear of the coins when manufactured would also be saved to the people. This is one step in civilization. When the perfect legal-tender certificates pass into the circulation as money, the Government will sell this bullion to barbarous nations, or such semi-civilized people as yet enslave their laboring classes by limiting their currency in any degree to gold and silver. When the people have learned that the Government can issue its currency based upon bullion or the commodity value of one or two commodities, piled up and guarded in costly buildings and iron safes, they will soon learn that they may issue their currency based upon all commodities, including gold and silver; that the credit of thirty-eight great States with sovereign power over the lives of 50,000,000 of people and \$40,000,000,000 of wealth is a better basis and less changeable security for the currency of the country. Then \$250,000,000 of gold and silver now lying idle will be paid into the circulation. Then the people will stop that unnecessary system of injustice called interest upon the public debt, by means of which the people of this country are now unnecessarily taxed. Then we shall take one more step in civilization, and the American people may truthfully and intelligently celebrate their independence.

How much more convenient in use and how much more economical the use of fractional paper currency, thereby saving expense in the material and coinage, together with the wear of the coin. There has never been but one serious objection to the use of fractional paper currency and legal-tender Treasury notes: it would successfully destroy the occupation of those grand conspirators who have become millionaires by controlling the currency and pauperizing and enslaving the American people. If the people were to issue and control the amount of all circulating currency without placing the American people at the mercy of either bullionists or bankers, no toll-gates placed by licensed money lords upon the highways of commerce, the people would be protected from periodical money panics, from improper inflation and contraction, and be allowed an opportunity to enjoy a reasonable proportion of the products of industry.

The proposed appropriation for the Philadelphia mint appears to be in the interest of a certain locality, and very intimately related to this mint appropriation is a number of bills proposing to build assay offices at different places in the interest of local speculators.

We have the report of the Director of the Mint, page 36, showing the result of the four assay offices now in operation. The earnings during the fiscal year ending June 30, 1881, were, at the New York assay office \$115,257.83, and the expenditures \$152,034.38, a loss to the Government of \$36,776.55; the Boise assay office, earnings \$441.69, and expenditures \$7,940.15, a loss to the Government of \$7,498.46; the Charlotte assay office, earnings \$995.37, expenditures \$3,750, a loss to the Government of \$2,754.63. The Helena assay office earnings were \$2,551.71, and the expenditures were \$25,163.31, a loss to the Government of \$22,611.60, making a total loss annually of \$39,641.24, besides the interest upon the cost of the buildings and

loss by wear and decay of buildings and machinery. The average loss per year of each of the four offices now in operation is \$17,410.31. The estimated cost of an assay office is \$60,000.

I believe it is my duty to represent the interests of the American people without regard to the pressure which may be brought to bear in building up local interests and making places for friends at high salaries, to be paid from the Government Treasury. There is an immense pressure for appropriations, as though there were no limit to the people's endurance in paying taxes. I see no good reason why the Government should make large appropriations of this character while the people are carrying a large interest-bearing debt, and while the claims of thousands of honest, hard toiling soldiers are neglected.

We should be just before we attempt to be generous or profligate with the public money. Poor men with large families have grown gray with age waiting for their just dues. Thousands of people deprived of the comforts of life and struggling in poverty are earnestly and prayerfully begging for justice at our hands.

Internal-Revenue Taxation.

SPEECH

OF

HON. SAMUEL S. COX,

OF NEW YORK.

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, June 27, 1882,

On the bill (H. R. No. 5538) to reduce internal-revenue taxation.

Mr. COX, of New York, said:

Mr. SPEAKER: Because of some indefinite expressions yesterday, I desire briefly to emphasize now the reasons why I cannot vote for this measure. My reasons are as follows:

1. That the sum released—some sixteen millions—from the grasp of the tax collectors is so inconsiderable as to be an insult to those who desire to reduce our inordinate taxes.
2. That the amount released discriminates against industries and relieves capital and capitalists. It relieves nine millions of capital tax, bank taxes—and as to the rest it is nothing in comparison with the exactions.
3. The relief on perfumery is but an "ounce of civet, good apothecary, to sweeten the imagination," and is a sample of the little good compared with such an immense opportunity.
4. That the internal-revenue system is used to control the freedom of elections, and is a part of that mercenary and terrific system which should have been destroyed by legislation shortly after the emergency which called it into being. It is expensive, inquisitorial, and odious. It is undemocratic and unrepugnant. It is corrupting. In the absence of a reform in the tariff, postponed for two years by the commission, this is the only feasible way of reducing taxation; and this is a signal failure, which, if adopted, will be an impediment to further reforms and reduction.
5. The tax reduced here does not reduce the officials now used in the collection of taxes by any one person. It keeps up every part of the machinery.

Public Building, Williamsport, Pennsylvania.

SPEECH

OF

HON. R. J. C. WALKER,

OF PENNSYLVANIA.

IN THE HOUSE OF REPRESENTATIVES,

Monday, June 26, 1882,

On the bill (H. R. No. 4460) to authorize the purchase of a site and the erection of a suitable building for the United States district court, post-office, and other Government offices at the city of Williamsport, Pennsylvania.

Mr. WALKER said:

Mr. SPEAKER: On the 17th of December last I introduced a bill (H. R. No. 1449) for the erection of a public building for the use of the Federal courts and other Government offices in the city of Williamsport, Pennsylvania. Subsequently I appeared before the Committee on Public Buildings and Grounds of both House and Senate, and submitted certain reasons and statements in support of the bill. On the 16th of February Mr. LEWIS, of the House committee, reported

back the same with a substitute, (H. R. No. 4460,) being the bill on which present consideration is asked.

Without attempting to present argument in support of the policy which favors the construction by the Government of buildings suitable and proper for its own purposes, especially at places where the Federal courts are held, the wisdom and necessity of which I heartily indorse, I propose now to briefly recapitulate some of the statements presented to the committee and which influenced its action in unanimously reporting with a favorable recommendation the present bill:

UNITED STATES COURTS.

By section 545 of the Revised Statutes of the United States the State of Pennsylvania for the purposes of the United States courts is divided into two judicial districts, the eastern and western. The western district includes the counties of Fayette, Greene, Washington, Allegheny, Westmoreland, Somerset, Bedford, Huntingdon, Centre, Mifflin, Clearfield, McKean, Potter, Jefferson, Cambria, Indiana, Armstrong, Butler, Beaver, Mercer, Crawford, Venango, Erie, Warren, Susquehanna, Bradford, Tioga, Union, Northumberland, Columbia, Luzerne, Lycoming, and certain other counties embraced in the territory contained therein, which have been erected into new counties since the passage of the act creating said district.

The eastern district includes the residue of the State, and the courts therein are held in Philadelphia. The courts in the western district, comprising the territory above referred to, are held at Pittsburgh, Erie, and Williamsport. The courts at Pittsburgh accommodate the citizens west of the Alleghany Mountains. The courts at Erie are held for a few days each year, mainly on account of occasional admiralty business arising on the lakes; no clerk's office is kept there, however, and no docket or court papers. The courts at Williamsport accommodate the citizens of all the counties, twenty-two in number, named in the exhibit marked "A," and made a part hereof, and to which a special reference will hereafter be made.

From January 1, 1877, to January 1, 1882, a period of five years, there were five hundred and forty-six summonses issued in the circuit court at Williamsport, or an average of one hundred and nine each year. This does not include the business in the district court, namely, all criminal cases and cases arising under the tax and internal-revenue laws of the United States, and of which there are always quite large lists at each sitting of the court. At the September term of 1880 there were one hundred and twenty-six cases on the trial list of civil business alone.

At present these courts are held in a small room, which is used by and contains the library of the Law Association of Lycoming County, and which would not comfortably seat one hundred people. It is located in the second story of the county court-house and is needed for county purposes. There is no proper place to keep the records, dockets, and papers of the court. They are not deposited in a safe or vault because none is provided for that purpose; they are liable to be stolen by parties interested, or destroyed by fire. The clerk (Hon. B. Stuart Bentley) has heretofore, without the slightest remuneration, cared for some of the most valuable ones in his own private fire-proof, but this is totally inadequate for the purpose required to properly preserve and secure the many and important court records and papers, the disappearance or destruction of which would entail untold loss and damage to the parties in interest and to the community at large. The United States courts have been held in the city of Williamsport for more than forty years.

TERRITORY, POPULATION, BUSINESS.

Reference to Exhibit A, being extracts from official records, shows that twenty-two counties, whose business in the United States courts is now transacted at Williamsport, contain 15,458 square miles, 9,847,520 acres, and, by the census of 1880, a population of 834,490 people.

There is no post-office, court-house, or other public building of any kind whatsoever owned by the United States in any of the counties named in said exhibit.

By reference to Exhibit B, hereunto annexed, the population of the counties named whose business is transacted at Williamsport is greater than any one of the fourteen States therein named, in one of which alone more than two millions of dollars have been expended for public buildings. The population of the counties named is greater than any one of the Eastern States, except Massachusetts.

The counties named include the bituminous coal regions of Clearfield, Centre, Clinton, Cameron, Elk, McKean, Potter, Tioga, Bradford, Sullivan and Lycoming.

The counties named include the anthracite coal regions of Susquehanna, Wyoming, Lackawanna, Luzerne, Columbia, Montour, and Northumberland.

The counties named include the iron-producing and manufacturing regions of Centre, Clearfield, Mifflin, Juniata, Snyder, Union, Lycoming, Northumberland, Montour, Columbia, Luzerne, and Lackawanna.

The counties named include the bark and tanning interests and almost the entire white pine, hemlock, and hard wood regions of Pennsylvania, the value and extent of which are indicated by an official communication from the president of the Lumberman's Exchange, hereto annexed, marked "Exhibit C."

The counties named include almost the entire coal-oil producing territory of Pennsylvania, the enormous value of the product of which when refined into the petroleum of commerce is indicated by the communication and tabulated statement showing the production for the year 1881, herewith annexed and marked "Exhibit D."

RAILROADS AND CANALS.

The following railroads and canals pass into or through many of the counties named, namely: Pennsylvania Railroad, middle division and branches; Philadelphia and Erie, and branches; Northern Central Railroad; Buffalo, New York and Philadelphia Railroad; Philadelphia and Reading Railroad; Catawissa Railroad; Delaware, Lackawanna and Western Railroad; Lehigh Valley Railroad; Lehigh and Susquehanna Railroad; New York and Pennsylvania Railroad; Corning and Blossburgh Railroad; Corning and Cowanesque Railroad; Corning and Wellsborough Railroad; Delaware and Hudson Railroad; West Branch Canal; North Branch Canal; Susquehanna Canal.

CAPITAL AND EMPLOYÉS.

The amount of capital and the number of employés in the coal, iron, lumber, petroleum, bark, tanneries, agricultural and manufacturing interests in the counties named is enormous; millions upon millions of money and thousands upon thousands of men. Much of the capital engaged and lands held and operated belong to non-residents of the State. This gives rise to a large amount of business in the United States courts. In addition, the national banks and foreign insurance companies, and cases arising under the internal revenue laws are numerous. Many questions of title to real estate and other vast interests are settled in the United States courts at Williamsport.

INTERNAL REVENUE.

The receipts of the internal-revenue office here for the counties of Lycoming, Clinton, and Centre for the year 1881 were:

Special tax.....	\$20,069 88
Tax on beer and cigars.....	29,639 14
Whisky in bond.....	6,000 00
Sale of distilled spirits.....	10,000 00
Total.....	65,709 02

POST-OFFICE.

The net proceeds of the Williamsport post-office for the year 1881 was \$24,894.20, and as respects net revenue to the Government it ranks fourth in the entire State, (see appendix,) \$24,894.20.

This office is a depository for nearly all the post-offices of the third and fourth class in this Congressional district, (comprising six counties with a population of over 184,000,) and also the offices in Clinton, Centre, and part of Elk Counties.

The amount of the deposits from these offices, and which is the net revenue to the United States Government, is about \$12,000 per quarter.

From Pennsylvania the United States derives a large revenue for postal service, and thus actually contributes money for public buildings erected within her borders.

What has been stated as to the insecurity of the United States court papers, records, applies with equal force to the post-office and its valuable contents, as also to the internal-revenue office located at Williamsport, the business of which is now transacted in a hat store.

THE CITY OF WILLIAMSPORT.

Williamsport, the county seat of Lycoming County, Pennsylvania, is situated on the west branch of the Susquehanna River and is distant more than two hundred miles from Philadelphia, Pittsburgh, and Erie, the other points in the State where United States courts are held, and is the geographical center of the counties named, whose business in said courts is transacted there. It has now a population of twenty thousand people, and is a healthy, prosperous, and growing city, surrounded by high hills, a fine scenery, and is a favorite summer resort. Its streets are wide, straight, lighted with gas, and traversed by a horse-railway. The business quarter is compactly built; its hotel accommodations not excelled by any city in the State, (Philadelphia and Pittsburgh excepted,) and it has many handsome and costly private residences. It has nine public schools, with a high school, attended by nearly four thousand pupils; and a large institution known as Dickenson Seminary, attended by students from all parts of the United States. It has thirty-two churches, two daily and nine weekly newspapers.

The great boom located here extends four miles up the river, and at one time last year contained about two hundred millions of feet of lumber in the log. Nearly three hundred and fifty millions of feet of lumber were manufactured here during the year 1881. For many years the annual product has exceeded two hundred million feet. Besides the saw-mills which manufacture this lumber, there are planing and shingle mills, furniture factories, tanneries, a large rolling-mill, and many other industrial establishments.

There are six national banks, having ample capital; the aggregate of deposits thereof on January 1, 1882, exceeding \$1,700,000.

The county jail is one of the best in the whole State, guaranteeing the safe custody of prisoners held by the Government.

Mr. Speaker, many other facts could be added to those which I have stated, but I will not trespass on the indulgence of the House—believing that what has already been said is entirely sufficient to commend the bill to favorable consideration.

EXHIBIT A.

Statistics of the counties in Pennsylvania whose business in the United States courts is done at Williamsport. Compiled from official records. Population taken from census report of 1880.

EXHIBIT C.

WILLIAMSPORT, January 31, 1882.

DEAR SIR: Yours of 25th instant duly received. The delay in answering has been caused by reason of my not being able to get the figures asked for at an earlier date. I find that there was manufactured during the past five years, 1877 to 1882, inclusive, the following:

Pine, 900,000,000 feet, @ \$15 per M..... \$13,500,000
Hemlock, 125,000,000 feet, @ \$8.50 per M..... 1,062,500

The above figures are as near correct as can be obtained, and the value as placed on the lumber is, if anything, below the amount realized to the parties manufacturing the same.

The hemlock trade is, as it were, in its infancy, as nearly one-half of the amount above stated was cut last season. As for the future, it is very hard to obtain an accurate statement of the amount of pine and hemlock timber remaining uncut. It is conceded by our best-informed timber owners that there yet remains fourteen to fifteen hundred million feet of pine and many times that amount of hemlock to be cut, most of which will find its way to Williamsport to be manufactured, the value of which should be greater than the prices fixed in the foregoing statement. These figures only apply to the counties drained by the west branch of the Susquehanna tributaries.

There are no other figures that occur to me at this time that pertain to the subject-matter of your favor of the 25th instant. Should you wish any further information do not hesitate to call for it, and I will do my best to obtain it for you.

Very respectfully, yours,

F. COLEMAN.

President Lumberman's Exchange, Williamsport, Pennsylvania

Hon. R. J. C. WALKER.

EXHIBIT D.

THE BRADFORD OIL EXCHANGE.

Bradford, January 30, 1882.

DEAR SIR: In answer to your favor of January 25, please find herewith the statistics as requested.

I shall be very happy to be of service to you at any and all times, either "officially" or personally.

If I have neglected anything please write, and I will correct promptly. * * *
Very respectfully, yours,

C. L. WHEELER, President.

Hon. R. J. C. WALKER,
Washington, D. C.

Petroleum production of McKean County, Pennsylvania, for the year 1881.

Months.	Per day.	Per month.
	Barrels.	Barrels.
January.....	59,558	1,846,298
February.....	61,830	1,761,240
March.....	66,298	2,053,378
April.....	64,779	1,943,370

September.....	67,319	2,019,570
October.....	65,924	2,043,644
November.....	64,766	1,942,980
December.....	62,365	1,933,315
Total.....		24,082,580

Average price for 1881, 83½ cents, \$20,169,160.75.

Value of crude oil production of McKean County, Pennsylvania, for the year 1881, when refined, at the average price for the year, 7½ cents per gallon, \$38,791,598.42.

Crude oil produces about 72 per cent. of illuminating oil, but there are other valuable products, as naphtha, tar, &c., which makes the product equal in value to 75 per cent.

Crude oil produced.....	1,011,468,360
Refined oil, equivalent.....	758,601,270

Sales of crude oil in the Bradford Oil Exchange, during 1881, 137,034,000 barrels.

C. L. WHEELER,
President the Bradford Oil Exchange,
McKean County, Pennsylvania

APPENDIX.

POST-OFFICE DEPARTMENT.
OFFICE OF THE FIRST ASSISTANT POSTMASTER-GENERAL.
Washington, D. C., February 17, 1882.

MY DEAR SIR: For the information asked for in your note of February 16 I would call your attention to page 89 of the Auditor's report for 1881, to which I have added population obtained from a bulletin from the Census Office to the nine letter-carrier offices in Pennsylvania. I also append names and incomplete data for ten offices supposed to be the ten largest, taking salary as a basis.

I was not able to get at the net revenues of Oil City or Titusville to-day.

Very truly, yours,

HUGH NISBET.

Hon. R. J. C. WALKER, House of Representatives.

Cities.	Salary.	Population.	Revenues (net.)
Philadelphia.....	\$4,000	846,984	\$787,216 58
Pittsburgh.....	3,600	156,381	195,717 46

* Less than 10,000.

Mr. WALKER. Mr. Speaker, I now ask unanimous consent that the Committee of the Whole House on the state of the Union be discharged from the further consideration of the bill (H. R. No. 4460) to authorize the purchase of a site and the erection of a suitable building for the United States district court, post-office, and other Government offices at the city of Williamsport, Pennsylvania, and that the same be now put on its passage.

The bill was read, as follows:

"Be it enacted, &c., That the Secretary of the Treasury be, and he is hereby, authorized and directed to purchase a site for, and cause to be erected thereon, a suitable building, with fire-proof vaults therein, for the accommodation of the United States district and circuit courts, post-office, and other Government offices, at the city of Williamsport, Pennsylvania. The plans, specifications, and full estimates for said building shall be previously made and approved according to law, and shall not exceed for the site and building complete the sum of \$125,000: Provided, That the site shall leave the building unexposed to danger from fire in adjacent buildings by an open space of not less than forty feet, including streets and alleys; and no money appropriated for this purpose shall be available until a valid title to the site for said building shall be vested in the United States, nor until the State of Pennsylvania shall have ceded to the United States exclusive jurisdiction over the same, during the time the United States shall be or remain the owners thereof, for all purposes except the administration of the criminal laws of said State and the service of civil process therein."

Mr. HOLMAN. I think we had better have the regular order.

Mr. WALKER. I ask the gentleman to listen to the reading of the report in this case. The building which this bill proposes to erect is necessary for Federal purposes, for the accommodation of the United States courts, in the business of which twenty-two counties, embracing a population of over 800,000 people, are interested. There has never been a dollar of public money asked for that district. I hope the gentleman will withhold his objection, at least until the report has been read.

Mr. HOLMAN. I have no objection to the reading of the report, the right to object being reserved. My objection to all these bills is that the amount involved is too large.

THE SPEAKER. The right to object will be reserved until the report has been read.

The report was read, as follows:

"The Committee on Public Buildings and Grounds, to whom was referred the bill (H. R. No. 1449) for the erection of a public building at Williamsport, Pennsylvania, beg leave to report that they have had the same under consideration, and find the following facts:

"Williamsport is situated in the State of Pennsylvania, county of Lycoming, on the west branch of the Susquehanna River. It is the acknowledged center of the lumber interests of the Middle States, and this vast industry, coupled with the coal-carrying trade of the bituminous coal-fields lying in counties adjacent to the west and south, and the anthracite coal measures in counties immediately to the east, stimulate a carrying trade which supports the fourteen railroads and three canals now traversing that prosperous section. Its trade is rapidly increasing, in petroleum from westward, and bark, tanneries, agricultural and manufacturing interests in its closer proximity, and the population of the city has now reached 19,924.

"The great boom on the Susquehanna is located here, extending up the river four miles, and at one time in 1881 contained about 200,000,000 feet of lumber in the log; nearly 350,000,000 feet of lumber were here manufactured during that year; for a long term of years the annual product has exceeded 200,000,000 feet. In addition to the numerous saw-mills, the finest in the world, are extensive manufactories in wood, iron, and one, the only rubber works in the State, with a capacity of 3,000 pairs of boots and shoes per day. There are six national banks, two daily and nine weekly newspapers, thirty-two churches, nine public schools, and others of academic proportions, and hotel accommodations the finest in the State, Pittsburgh and Philadelphia excepted.

"The United States court is held at Williamsport for the accommodation of the citizens of twenty-two counties, which, by the census of 1880, contain a population of 834,490. This is greater than any one of the Eastern States, excepting Massachusetts, and more than any one of the fourteen States named in Exhibit B.

"The United States courts are held in a small room which is used by and contains the library of the Law Association of Lycoming County, and which will not comfortably seat one hundred people. It is located in the second story of the county court-house. The United States courts have been held here more than forty years. The internal-revenue office is in a hat store. No fire-proof accommodations for court records and valuable post-office contents have ever been provided by the Government.

"The net proceeds of the Williamsport post-office for 1881 was \$20,270.37. It is the depository for nearly all the post-offices of the third and fourth class in that Congressional district, comprising six counties, with a population of over 184,000, and also the offices in Clinton, Centre, and part of Elk Counties.

"The receipts of the internal-revenue office for the year 1881 were:

Special tax	\$20,069 88
Tax on beer and cigars	29,639 14
Whisky in bond	6,000 00
Sale of distilled spirits	10,000 00
Total	65,709 02

"At the September term of 1880 there were one hundred and twenty-six cases on the trial list at Williamsport of civil business alone. This does not include business in the district court, namely, all criminal cases and causes arising under the tax and internal-revenue laws of the United States, of which there are always large lists at each sitting of the court.

"In view of these facts the committee recommend that the erection of the building proposed be authorized, and that the bill as amended do pass."

Mr. HOLMAN. Reserving the right to object, I will say that gentlemen around me think, on account of Williamsport being a place where the Federal courts are held and a town of very considerable importance, an appropriation of some amount for a public building there would be proper. While I think that an appropriation of \$100,000 is much too large, I shall feel constrained to withdraw my objection if the gentleman from Pennsylvania [Mr. WALKER] will consent that the bill be amended by striking out \$125,000 and inserting \$100,000.

Mr. WALKER. I say to the gentlemen from Indiana, [Mr. HOLMAN,] as I have already said to the House, that not one of the bills of this character presented and considered possesses greater merit than this, and I believe that reflection and investigation would so convince any gentleman, but rather than jeopard the interest of so large a number of my people I will reluctantly consent to accept the amendment.

The SPEAKER. It is moved to amend the bill by striking out the words "and twenty-five," so as to make the amount of the appropriation \$100,000. If there be no objection, this amendment will be considered as agreed to.

There was no objection.

The bill as amended was ordered to be engrossed for a third reading, was read the third time, and passed.

Mr. WALKER moved to reconsider the vote by which the bill was passed; and also moved that the motion to reconsider be laid on the table.

The latter motion was agreed to.

Opposition to Civil Pensions.

SPEECH

OF

HON. STROTHER M. STOCKSLAGER,
OF INDIANA.

IN THE HOUSE OF REPRESENTATIVES,

Monday, June 19, 1882,

On the bill (H. R. No. 3983) to promote the efficiency of the revenue-marine service.

Mr. STOCKSLAGER said:

Mr. SPEAKER: This bill is entitled "A bill to promote the efficiency of the revenue-marine service," but is in reality a bill to retire certain officers engaged in the civil service of the Government at full pay; to retire others at three-fourths pay; to pension for a limited time such as may become disabled in such service. Or, to state its provisions more fully, it is proposed by this bill to retire all officers of the service who shall be incapacitated to perform the duties of their offices, without regard to the cause of the incapacity, except in this: when the incapacity is incident to the service he shall be retired on three-fourths pay, and if not incident to the service at one-half pay; or, if wholly retired, then to one year's full pay. The bill also provides that any officer who has attained or who hereafter may attain to the age of sixty-five years, shall be retired by reason

of age at three-fourths duty pay; and any officer who shall have served forty years in said service may, at his own request, be retired by the President at three-fourths of the duty pay of his grade.

Our revenue-marine service has been in existence since 1799, and was established and is maintained for the following purpose, as expressed in section 2747 of the Revised Statutes, to-wit:

The President may, for the better securing the collection of import or tonnage duties, cause to be maintained so many of the revenue cutters as may be necessary to be employed for the protection of the revenue, the expense whereof shall be paid out of such sum as shall be annually appropriated for the revenue-cutter service, and not otherwise.

The officers are appointed by the President, by and with the advice and consent of the Senate. The compensation of a captain while on duty is \$2,500 a year; of first lieutenant, \$1,800; second lieutenant, \$1,500, and third lieutenants and engineers, \$1,200 per year.

That this service is simply and purely a civil service there can be no doubt. It is certainly neither military nor naval. It is a branch of the civil service of the Government. The officers are appointed by and with the advice of the Senate, the same as are all the President's appointments in the civil service. The service is under the direction and control of the Secretary of the Treasury, and the duties of the service are connected entirely with the collection of customs. The only exception is that the President may direct the revenue cutters to co-operate with the Navy, during which time they shall be under the direction of the Secretary of the Navy.

It follows, therefore, that this is an attempt to add another class to our civil pension list. And what is very extraordinary is that the Committee on Commerce should have directed the gentleman in charge of this bill to ask this House to suspend the rules of the House by a two-thirds vote and pass this bill without sufficient opportunity upon the part of those who are opposed to it to discuss its provisions.

Mr. Speaker, nothing, I take it, could show more conclusively the headlong speed at which we are drifting toward an enormous civil pension list than the fact which I have stated.

While I am in favor of liberal pensions for the soldiers and sailors disabled in the defense of their country, I am opposed to extending the provisions of our pension laws to claims purely civil. The ground upon which military and naval pensions exist is so different from that of civil pensions that it is useless to take up the time of the House in discussing it. The soldier or sailor takes his life in his hand and offers it a willing sacrifice upon the altar of his country. He does this, not because the occupation is more remunerative than a civil employment, and not because he prefers that service, but from the highest and most patriotic of all the duties of a citizen—that of defending his Government, which has protected his life and property.

The man who engages in the civil service does it as a matter of choice, and because he thinks the honor and emoluments of the office are greater than he could gain in other pursuits.

The principle of civil pensions is all wrong. It is contrary to the genius of our institutions. It is a vicious system and can but be pernicious in its effects upon our institutions. It is anti-republican and anti-American; it is one of the curses which our fathers struggled so hard against, and which they fondly hoped they had escaped; it belongs to the "effete monarchies of the Old World;" it is the legitimate outgrowth of a system which recognizes a ruling class, a dynasty, a divine right to rule, and the consequent duty of the country to provide for; it tends to make men in office feel safe and secure for the future and, instead of practicing economy and living in republican simplicity which will meet the approbation of the people, will spend their salaries in riotous living and ape their foreign prototypes.

Such a thing as a civil pension list would have met with little favor in the earlier days of the Republic. Our ancestors believed in pure republican simplicity, and were opposed to building up and permanently maintaining any class of citizens at the expense of the Government. From the formation of the Government down to the year 1869, more than three-quarters of a century, no one dared to seriously propose such a thing. But the Republican party in 1869, flushed with victory, when it undertook to increase the number of judges of the United States courts, it is said for the purpose of obtaining a desirable partisan decision, added a provision to the bill to the effect that—

Any judge of any court of the United States who, having held his commission as such at least ten years, shall, after having attained the age of seventy years, resign his office, shall thereafter, during the residue of his natural life, receive the same salary which was by law payable to him at the time of his resignation. (Statutes at Large, vol. 16, page 45.)

This act, approved by General Grant on the 10th day of April, 1869, marked a new departure in our Government, and was the first step in the history of the Government toward the establishment of a civil pension list. When that bill was under discussion in this House, my illustrious predecessor, the lamented Michael C. Kerr, with his statesmanlike vision saw the danger in that provision, and upon this floor sounded the warning to the people in the following eloquent and patriotic words:

I have, however, several objections to the substitute offered on behalf of the Committee on the Judiciary. The first objection is that it undertakes, as a pioneer measure, as an initial enactment, to introduce into our system of government the practice of pensioning retired officers. It proposes to pension judges not only

of the Supreme Court but of the circuit and district courts, whether State or Territorial; to pension all of them after they shall have served in a judicial capacity for ten years. It is the first attempt, so far as I know, to organize in this country a civil list, a pension list of retired officers, and that, too, upon full pay. I think it is intrinsically a pernicious and a vicious proposition. I think it is not in harmony with the principles of our Government, with the principle of representative, elective, republican government. * * * Once establish the practice of retiring and pensioning officers, although now limited to the judiciary, and it will be speedily extended to numerous other classes, and will soon become a great source of additional expenditure, and, in my judgment, a very great evil. Establish the principle, and its rapid growth will be assured.

Mr. Speaker, the words which have been read express my objections to this whole system in language much more eloquent and forcible than I am capable of expressing them. And I now upon this occasion repeat that solemn warning, and I hope this House will heed it and not permit this bill to pass.

Mr. Speaker, let us for a few moments inquire whether the prediction of Mr. Kerr, that if the practice of retiring and pensioning officers was once adopted it would grow and be extended to other classes than the judiciary, has been verified. Since that time a pension has been granted to Mrs. Lincoln, the widow of President Lincoln. During the present session of this Congress a bill has been passed increasing that pension to \$15,000. This bill passed this House without a protest, and if a case could be presented in which it would be proper to vote a civil pension, if we have been correctly informed as to the condition of this good lady, I am frank to say that was such a case.

With undue haste, within a few months after the death of President Garfield, we gave his widow a pension five times greater than that received by the widow of any soldier who lost his life in any of our wars. The poor soldier who lost both his eyes in defense of his country, and who must spend the balance of his life wandering up and down the earth in total darkness, now gets a pension of less than one-eighth the amount given her; and all this, Mr. Speaker, with the full knowledge of the fact that she was the owner of property estimated to be worth \$400,000, over \$300,000 of which is in bonds, money, and stocks. Sir, I regret that Mrs. Garfield did not refuse to accept the pension voted her, and thus rebuke our action in voting it to her. It would have been a noble example to which we could have pointed with pride in all future time. After the bill passed this House the names of Sarah Childress Polk and Julia Gardner Tyler, the widows of ex-President Polk and ex-President Tyler, were added by the Senate, and they were each given \$5,000 per year. It was represented that these ladies were needy. A precedent for pensioning the widows of ex-Presidents has thus been firmly established during this session of this Congress. The Government has been gradually drifting into a paternal government; and opposition to that bill would have been useless in this House; and the person who would have dared to interpose an objection would have made himself an object of ridicule in this House, and, I fear, by a great many persons outside of this House.

But the growth of this sentiment in favor of civil pensions has been so rapid that we find it does not stop at judges of the United States courts and the widows of ex-Presidents, but it has gone far beyond this. During the present session we have added to our civil pension list persons incapacitated by injury or disease in the Life-Saving Service, for a limited period.

We find also in the report of General Raum, the Commissioner of Internal Revenue, the following very remarkable recommendations. In his report for the fiscal year ending June 30, 1881, at page 8, he uses the following language:

On the 9th day of August, 1878, Deputy Collector Cooper, of Knoxville, Tennessee, while co-operating with other officers in putting down armed resistance to the law, was shot and instantly killed, and on the 20th of July last Deputy Collector Thomas L. Brayton, of South Carolina, was killed by an illicit distiller, under circumstances of peculiar atrocity. Each of these officers left a wife and children bereft of their natural means of support. Deputy Collectors Cooper and Brayton, equally with Lieutenant McIntire, lost their lives in the service of the Government and in the efforts to enforce its laws against armed resistance, but being in the civil instead of in the military service of the Government, the law makes no provision for the relief of their widows and orphans. This distinction is not just, and I respectfully suggest the propriety of legislation authorizing suitable pensions to be awarded to the widows and dependent families of officers and employes killed in the enforcement of the law, and directing proper provisions to be made for officers and employes wounded or disabled in the service.

Here we have the officers in charge of the revenue service of the country urging the extension of the pension system to all the officers and employes in that service. This House and the country can readily see what a vast army of persons are sought to be added to our civil pension list. Of course no one will dispute the fact that the two cases put by the Commissioner are cases of peculiar hardship. But, Mr. Speaker, it will always be easy to find cases presenting great hardships and appealing to the sympathies of the members of this House; but we should not forget that our Government is not paternal, and that it is not the business or duty of this Government to support all persons who happen to need its assistance. These officers and employes are engaged in the civil service of the Government, and are all well paid for their services. But I am met with the argument that these men met with armed resistance, and therefore they should be pensioned; the same argument would apply to every marshal or other peace officer in the Government.

But I maintain, Mr. Speaker, that a large part of these collisions which occur are produced by the greed of the officers in their zeal to increase their fees in making improper and unnecessary arrests of

persons guilty of no offense, and thus inciting and bringing on violence. And I have no doubt in some cases they are made for the purpose of making partisan political capital. In support of what I have said upon this point, I will read the portion of the report of the Commissioner which is found on page 9 of said report:

Wherever the rights of a citizen in person or property are involved, it is better that an officer shall err by doing too little than by doing too much. The best and most satisfactory work of an officer is performed from a sense of duty. Where the pecuniary interests of the officer are promoted by the oppression of the citizen there is great danger of abuse, and a system of laws which makes it the interest of an officer to thus misuse his authority is wrong in principle, and will, by the permanent temptation to evil, breed abuses even in long-established and well-ordered communities under the most careful system of administration. In new and remote settlements this practice, at times, will be little better than brigandage.

I regard the system of fees and allowances to marshals and district attorneys as open to this objection. Their maximum compensation is fixed by law and the orders of the Attorney-General, but the amount actually received depends almost wholly upon the institution and prosecution of cases in court. While these officers are paid out of the Treasury in respect to cases in which the United States is a party, the compensation thus paid is for fees made, expenses incurred, and services rendered in connection with criminal and civil cases instituted in behalf of the United States. The district attorney is made the judge of the propriety of commencing a criminal prosecution against a citizen on account of which he and the marshal will receive pay from the Government whether the party be guilty or innocent. These officers may prefer complaints against citizens, cause United States commissioners to issue warrants, may arrest and examine the parties before the commissioner; and the district attorney, marshal, guard, witnesses, and the commissioner will all get their fees from the Government even though the party arrested be discharged.

Instances have been brought to my attention where numerous prosecutions have been instituted for the most trivial violations of law, and the arrested parties taken long distances and subjected to great inconvenience and expense, not in the interest of the Government, but apparently for no other reason than to make costs. I have consulted with a number of prominent district attorneys and marshals, and they all concurred with me in condemning the system under which they are compensated for their services as one calculated to encourage abuses. It is not to be wondered at that abuses have grown up under such a system. The wonder is that the abuses are not greater. A remedy will be found by fixing by law the salaries of district attorneys and marshals, and paying them as other officers from the Treasury, and authorizing the Attorney-General to fix the salaries and traveling expenses of deputy marshals in the same manner that the salaries and traveling expenses of deputy collectors of internal revenue are now fixed. This plan would relieve these officers from all temptation to institute prosecutions for petty and trivial violations of the revenue laws where no frauds were committed or intended.

A bill has been introduced and is now pending in this House, the object of which is to carry out the recommendations of the Commissioner to pension the officers and employes of the revenue department. But, Mr. Speaker, this is not all. We find the disposition to extend this iniquitous system of class legislation and favoritism to the employes of the Post-Office Department. The Postmaster-General, in his last annual report for the fiscal year ending June 30, 1881, uses the following language:

PENSIONS IN THE RAILWAY MAIL SERVICE.

During the past fiscal year sixty-two railway accidents have been reported to this Department, in which seven employes of the railway mail service lost their lives, six of them having been burned to death; fifteen were severely and twenty-two slightly injured. No provision has ever been made for the widows and orphans of men killed in this service, nor for the continuance of pay to men disabled by injuries received while in the line of duty. Should no better plan commend itself to the wisdom of Congress, I would recommend that the Postmaster-General be authorized, as suggested by the general superintendent of railway mail service, to pay to the widow or guardian of the minor children of employes of this service killed in railway accidents the salary of the deceased for a period not to exceed two years. I also recommend that authority be given by law to continue men disabled by such accidents upon full pay until recovery, not to exceed one year.

A bill has been introduced in this Congress to carry out the recommendations of the Postmaster-General. If it becomes a law here will be another large class added to the list; and the principle once extended to the classes mentioned, how soon the argument will be made that after an officer or employe has served in the Government service for a given number of years he should be permitted to resign or be retired on full pay. Indeed such a bill has been already introduced in the Senate. Senator EDMUNDS has introduced a bill to allow all officers who may retire or be retired one year's pay, and after fifteen years' service two years' full pay; after twenty years, a pension of half pay; after twenty-five years, two-thirds pay; after thirty years, three-fourths pay; after thirty-five years, four-fifths pay; and after forty years' service, full pay.

Here, then, we have a broad, a sweeping bill to pension all employes of the Government who may retire or be retired, and also giving them pensions proportioned to the length of their service. But, Mr. Speaker, I think I have sufficiently called the attention of the House to this matter to satisfy every one upon this floor of the fact that we are in great danger of entering upon a new, vicious, dangerous, and expensive system of granting civil pensions. That it never was contemplated by the framers of our Government I think is evident to every thinking mind. Our ancestors dreaded and feared aristocracies of all kinds, whether aristocracies of wealth, landed aristocracies, or office-holding aristocracies, and looked upon them with great jealousy, as not being in harmony with republican simplicity and republican institutions, but as the outgrowth of kingly forms of government, of caste and of favored classes. Even Alexander Hamilton, who, more perhaps than any other of the great men of his time, favored a kingly form of government, recognized the fact that a civil pension list was not in harmony with our institutions. In the seventy-ninth number of the *Federalist*, written by him, in discussing that feature of our Constitution which provides that the salaries of the judges of the United States courts shall not be diminished

during their term of office, and in opposing an enforced retirement of judges after they arrived at a given age, uses the following language:

In a republic where fortunes are not affluent, and pensions not expedient, the dismissal of men from stations in which they have served their country long and usefully, on which they depend for subsistence, and from which it will be too late to resort to any other occupation for a livelihood, ought to have some better apology to humanity than is to be found in the imaginary danger of a superannuated bench.

The system, though of comparatively recent growth, is now firmly fixed in England, and is a part of the English system of civil service. It is less than fifty years since it had any considerable place in that system, but within that time has increased rapidly and grown to huge proportions. The civil list of that country now contains thousands of names. In a very imperfect list of pensions of over \$750 each for the last year in the Financial Reform Almanac, published in London, the cost of that part of the civil pension list to England was over \$6,000,000. England's total civil pension list amounts to about \$20,000,000 annually. In many cases the life pensions are commuted to a sum certain in cash, or a stated sum per year for a given number of years. There are some curious things connected with this list, and I wish each member of this House would go to the Congressional Library and examine it for himself. I will content myself with calling attention to a few cases:

The civil pensions are divided into nine classes, namely, annuities, compensation allowance, compassionate allowance, hereditary pensions, political pensions, pensions, retiring allowances, special pensions, and superannuation allowances.

The oldest pension named in the list is that to the heirs of Sir Thomas Clarges, the date of which is put at 1673, to two hundred and nine years ago. The amount paid to him and his heirs is put at \$905,000.

The next oldest is that to the Duke of Marlborough, the date of which is put at 1710, or one hundred and seventy-two years ago. The amount which has been paid to him and his heirs is put at \$3,420,000.

The next is to the Duke of Schomberg, who was accidentally killed by a shot from his own side in the battle of the Boyne, in 1690. In 1695 his heirs were granted a pension of \$20,000 per annum, which was paid to 1854, when it was reduced to \$2,000. The amount which has been paid to his heirs is put at \$3,400,000.

One man was pensioned for the sum of £7,191 on the excise, and for £3,384 on the post-office revenue, making the annual sum \$52,875, because he was descended from an illegitimate son of Charles the Second.

The Royal Family is also well provided for: the Princess Royal, married to the Crown Prince of Prussia, receives \$40,000 annually; the Prince of Wales, \$200,000; the Princess of Wales, \$50,000; Prince Alfred, \$125,000; Prince Arthur, \$75,000; the Princess Helena, (of Schleswig, &c.,) \$30,000; the Princess Louise, (of Lorne,) \$30,000; the Princess Mary, (of Teck,) \$25,000; the Prince Leopold, \$75,000; Princess Augusta, (of Mecklenberg-Strelitz,) \$15,000; Duchess of Cambridge, \$15,000; Duke of Cambridge, \$60,000.

This, of course, does not include the pay and allowances to the Queen and her household, which of itself amounts to the enormous sum of \$1,925,000 annually.

Of the thousands of names upon this list, as published, less than one hundred and fifty of them have been pensioners for more than twenty-five years. Less than 5 per cent. of the names upon England's civil pension list are of more than twenty-five years' standing. Let us take warning from this. Notwithstanding the fact that England's civil pension list is more than two hundred years old, yet 95 per cent. of the names upon the pension list, according to the best information which we can get, have been added within the last twenty-five years. And I think I would be safe in saying that fully 75 per cent. of them have found their way there within the last ten years.

I think I have abundantly shown, from the recommendations of the heads of departments and the bills now pending in this Congress, that we are in great danger of the same present rapid increase of our own civil list.

And now, Mr. Speaker, I desire again to warn this House and the country of the evils which will grow out of the establishment of this outgrowth of a monarchical system of government upon our system. We have a vast army of more than a hundred thousand Federal officers in this country, to which may be added that almost innumerable host known as employés. Extend this system as it is now proposed to do, and what excuse can be offered for denying its benefits to all the others? None—absolutely none at all. Are we prepared for this? I think not. And I feel sure of one thing, and that is that whatever we may think of it here, our constituents, the great mass of the people of this country who still love republican simplicity and desire it carried out in the management of the affairs of the Government, are opposed to it and will condemn it.

It will not only be burdensome to the tax-payers but will create an office-holding class with special rights, and enable that class after clamoring for and receiving official positions to separate themselves from the mass of their fellow-citizens as of the favored class. All of our official positions are sufficiently remunerative to make them sought after by the people. For months past this city has fairly

swarmed with applicants for positions. A hungry horde of office-seekers has been on hand for more than a year, Micawber-like, "waiting for something to turn up," for some official change or removal, some turn in the wheel of fortune which will place them in Government position. This is not, Mr. Speaker, for the honor of holding Government positions, but because they are more remunerative than positions in private life when similar duties are to be performed. The true policy, Mr. Speaker, is for us to stop here and now, and say that we will go no further in this direction. And I especially appeal to my Democratic friends in this House to take position against this encroachment and stand by the teachings and the example of Jefferson, the great founder and leader of our party, and let the Republican party, the legitimate descendant of the old Federal party and the advocate of a paternal government, take the responsibility not only of beginning this pernicious system but also of extending and continuing it if it shall be extended and continued.

Let us stand by the teachings of the fathers, and follow the principles enunciated by Jackson, the hero of New Orleans, when, in addressing the Senate nearly fifty years ago, he said:

I would persuade my countrymen that it is not in a splendid government, supported by powerful monopolies and aristocratical establishments, that they will find happiness or their liberties protected, but in a plain system, void of pomp, protecting all and granting favors to none, dispensing its blessings like the dews of Heaven, unseen and unfeigned, save in the freshness and beauty they contribute to produce. It is such a government that the genius of our people requires—such a one only under which our States may remain, for ages to come, united, prosperous, and free.

Necessity for publishing the abridgment of descriptions of patents and claims of inventors for public use.

SPEECH

OF

HON. THOMAS L. YOUNG,

OF OHIO.

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, June 13, 1882.

On House bill No. 6244, making appropriations for the legislative, executive, and judicial expenses of the Government for the fiscal year ending June 30, 1883, and for other purposes.

Mr. YOUNG said:

Mr. CHAIRMAN: I move to amend by inserting after the paragraph just read that which I send to the Clerk's desk.

The Clerk read as follows:

For preparing and printing classified abridgments of the patents of the United States, \$50,000.

Mr. YOUNG. Near the close of the Forty-sixth Congress, on the representations of the Secretary of the Interior and the Commissioner of Patents, an appropriation was made for commencing the work of abridging and condensing the patents of the United States.

Mr. ATKINS. What is the amendment?

The CHAIRMAN. The amendment has been read, and the gentleman from Ohio [Mr. YOUNG] is speaking upon it.

Mr. ATKINS. I want to reserve all points of order on the amendment.

The CHAIRMAN. If there is no objection, points of order will be reserved.

There was no objection.

Mr. YOUNG. When the distinguished gentleman from Tennessee [Mr. ATKINS] was chairman of the Committee on Appropriations in the Forty-sixth Congress, that committee reported a bill containing an appropriation of \$10,000 to be expended by the Commissioner of Patents for the purpose of preparing an abridgment of the patents of the United States.

Mr. ATKINS. I cannot hear the gentleman.

Mr. YOUNG. Come over here, then.

Mr. ATKINS. I cannot afford that; I do not take interest enough in what the gentleman says.

Mr. YOUNG. I am not permitted to leave my place. If you want to hear come up closer.

Mr. VANCE. If my colleague on the Committee on Patents will allow me, I will correct him. It was a bill reported by the Committee on Patents, and not by the Committee on Appropriations.

Mr. YOUNG. Nevertheless, the appropriation was made with the consent of the Committee on Appropriations.

Mr. ATKINS. It was not made by any such consent.

Mr. YOUNG. I will ask the gentleman if the appropriation was made at all?

Mr. ATKINS. It was made by the House. It was offered in the House by the Committee on Patents, and the Committee on Appropriations resisted it; but it was carried over the heads of the Committee on Appropriations.

Mr. YOUNG. It was a very good thing to be done.

Mr. ATKINS. The gentleman should be correct in his statement, then.

Mr. YOUNG. I think the gentleman ought to be correct himself. He made a statement a while ago in reference to this bureau of the Interior Department at variance with the truth. He stated among other things—

Mr. ATKINS. If the gentleman intends to make a personal point upon me I desire him to say so.

Mr. YOUNG. I do not intend to make any personal point upon the gentleman; I only want to correct his statement. The gentleman stated a while ago that the examiners in the Patent Office did not know what was going on; that, with all due deference to the Commissioner of Patents, for whom he had great respect, he thought the Commissioner did not know what was going on in his office.

Mr. ATKINS. Well, my speech will be reported in to-morrow's RECORD.

Mr. YOUNG. Wait until I get through. I do not believe there is a more capable man at the head of any bureau of the Government than Mr. Marble. There is no information in regard to his office that he cannot give. There is another thing: I do not believe the gentleman understood the facts when he stated that there are boys and girls in that office doing the work of the examiners. The statement is preposterous on its face, because they have not the talent for it. They may do work as copyists. It was this kind of assertion that made me utter the statement I did.

Now, a few words in regard to my amendment. In the forty-sixth Congress the sum of \$10,000 was appropriated for the purpose of making an abridgment of patents. In pursuance of that appropriation a force was put upon the work, which was continued until the sum was exhausted. Now, the Secretary of the Interior, knowing how useful this work is, not only to the office itself but to the country, has asked in the estimates \$50,000 for the continuation of this work. The Committee on Appropriations has thought proper to omit any appropriation of this kind. In offering this amendment I desire to show some reasons why it ought to be adopted.

In visiting the centennial exhibition in 1876 every American must have felt proud of the progress of the inventive genius of our country as compared with that of every other country. This progress has been largely due to the encouragement given by this Government to our inventors and our manufacturers, supported, sustained, and protected by our Patent-Office system. In England, in France, in Germany, and in other countries, whenever there is an exposition of the inventive genius of mankind, Americans carry away the prizes. Why? Simply because we encourage through the operations of our Patent Office men who make it their business to try to invent new methods for the improvement of agriculture and the manufacturing arts and sciences, upon which we depend for our material progress.

As economy seems to be a prime consideration with gentlemen on the other side, particularly at this time, I wish to say that as a matter of economy we ought to encourage this abridgment of patents for the purpose of assisting inventors and manufacturers as well as farmers and other classes of the community who use these inventions. [Here the hammer fell.]

Mr. BUTTERWORTH obtained the floor and yielded his time to Mr. YOUNG.

Mr. YOUNG. It is proposed to make this publication in order that the parties interested who will have to pay for copies of the work may be saved from being defrauded by peripatetic dealers in patented inventions. It is also an advantage to the inventor who, when he thinks he has a new idea, may go to this abridgment (which will be put within his reach at his own cost after it is published) and see whether his ideas upon any given subject have been anticipated.

I hold in my hand some specimen leaves of this work, done under the direction of the Commissioner of Patents under the appropriation of \$10,000 heretofore made. I invite any gentleman who feels interested in the question to examine these sheets. We do not ask that this money be expended in binding volumes for distribution. We ask that this work be printed for the use of the office, for the use of the examiners, and also for the use of inventors or patentees, who if they wish these volumes as they are published will have to pay for them. We know from the experiment already tried that the amount received from these books will more than compensate the Government for their publication. It is said it will cost a great deal of money. That is true; it will cost a great deal of money from year to year, but that money does not come from the tax-payers. As my friend from Illinois [Mr. TOWNSEND] has said, it comes out of the pockets of the inventors themselves, and is no tax upon the people generally. But I shall show further on that this is a mere loan, and not a permanent outlay of money as is generally supposed. As a matter of fact the work in the end will cost nothing to the Government, nothing to the inventors' fund, but be a source of revenue to the office.

We have a great many inventions to be abridged and described, two hundred and sixty thousand and over. Great Britain, which claims to be in the front rank of inventive genius, has only 146,000 of record; and notwithstanding that, the British Government has thought proper, and is liberal enough, to authorize the abridgment of her patents, very much to the use and benefit of her people, and of ours also if they choose to buy that abridgment.

Speaking of the receipts of the office and the reason why this amendment should be adopted, let me state that the surplus receipts of the Patent Office over expenditures for the last year were \$248,000. This money is covered into the United States Treasury. Where does it come from? From the pockets of inventors and the people who sustain inventors by buying their patents for use in different manufacturing factories.

If \$248,000 is turned into the United States Treasury it seems to me we could afford, without taxing the people, to pay \$50,000 a year out of that fund for the purpose of continuing the publication of this abridgment so as to bring it within the reach not only of patentees and inventors but within the reach and knowledge of every reading man in the country.

And more than that, Mr. Chairman, the \$248,000 which goes into the Treasury is a surplus which was never intended to go there. The Patent Office was established in the first place for the purpose of encouraging the useful arts. If any gentleman on this floor assumes or pretends it was intended as a revenue office I should like to know it. If it were intended as a portion of the internal-revenue system to gather money into the Treasury taken from the people for specific reasons and purposes, then the Patent Office ought to belong to the Internal Revenue Bureau and be legislated for accordingly. But there never was any such intention on the part of the men who originated the Patent Office, as the law establishing it declared it was established for the encouragement of the useful arts. It was intended to be self-sustaining and to pay its own way, and it does pay its own way and has this surplus. Men come here and on the ground of retrenchment and economy say it is a great extravagance and that it ought not to exist.

To all such men I simply reply that they wot not of that they speak. Mr. Chairman, I will venture to assert that the expenditure of the \$10,000 appropriated by the last Congress has, simply as an experiment, far more than repaid the Government in the use by the officials of the Patent Office of the abridgments of the class selected, as I shall show hereafter; but before doing so let us glance briefly at the history of all of the Patent Office publications.

The policy of "promoting the useful arts," which originally was declared to be the object of our patent system, has from the beginning been encouraged by liberal appropriations for the dissemination of information concerning their progress. As early as 1805 Congress ordered to be printed and gratuitously distributed lists giving the names and residences of inventors, and the titles and dates of inventions.

This was continued until 1843, when a demand for something concerning the essence of the invention was recognized, and the claims were added to the lists.

In 1853, when patents had become more numerous and inventors more practical and inquiring, a further advance had to be made, and a brief of the invention and suitable illustrations were added to the claims. Thus these publications grew, step by step, in response to popular demand, into what came at last to be the standard Patent Office Report, of which vast editions, at great expense, were freely distributed over the country, as the following table, which I believe has never before been printed collectively, will show:

ILLUSTRATIONS.

1843, one volume, 3,000 sets.
1844, one volume, 3,000 sets.
1845, one volume, 7,000 sets.
1846, one volume, 7,000 sets.
1847, one volume, 30,000 sets.
1848, one volume, 45,000 sets.
1849, one volume, 65,000 sets.
1850, one volume, 31,420 sets.
1851, one volume, 77,000 sets; cost, \$24,023.96.
1852, one volume, 77,000 sets; cost, \$22,229.72.
1853, one volume, 72,000 sets; cost, \$32,856.13.
1854, two volumes, 89,920 sets; cost, \$103,218.69.
1855, two volumes, 89,920 sets; cost, \$123,389.71.
1856, three volumes, 89,950 sets; cost, \$163,412.30.
1857, three volumes, 32,950 sets; cost, \$112,344.29.
1858, three volumes, 32,950 sets; cost, \$85,659.08.
1859, two volumes, 68,550 sets; cost, \$138,400.32.
1860, two volumes, 66,550 sets; cost, \$118,992.09.
1861, two volumes, 26,550 sets; cost, \$48,903.50.
1862, two volumes, 41,550 sets; cost, \$106,783.50.
1863, two volumes, 26,550 sets; cost, \$93,851.12.
1864, two volumes, 20,550 sets; cost, \$105,132.60.
1865, three volumes, 20,550 sets; cost, \$116,633.62.
1866, three volumes, 20,550 sets; cost, \$148,777.68.
1867, four volumes, 20,550 sets; cost, \$212,010.72.
1868, four volumes, 31,650 sets; cost, \$198,000.65.
1869, three volumes, 20,675 sets; cost, \$84,363.29.
1870, two volumes, — sets; cost, —.
1871, three volumes, — sets; cost, —.

(The number and cost for 1870 and 1871 could not be ascertained.)

Making a grand total of 2,139,449 volumes.

The expense of printing prior to 1851 could not be ascertained, but for the nineteen years from 1851 to 1869, inclusive, there was a total of 1,948,029 volumes, costing the Government \$2,038,982.97.

OTHER PUBLICATIONS.

But, in 1871, Congress discontinued the publication of the reports, and provided instead for the distribution of not exceeding one hundred and fifty sets of the printed specifications and drawings of all patents issued after that date to the capital of each State and Territory, and to the office of the clerk of each United States district court.

Practically, this amounted to a denial to the public of the benefits which Congress intended to confer by the change, as only two or three copies would go to many of the States, and those would be so far from the great body of inventors as to be unavailable for reference.

That there was a wasteful number of the old reports printed, and a reckless system of distribution employed, no one doubts; but who can say that the marvelous growth of invention in this country is not, after all, largely attributable to this liberality; and, if so, the benefits conferred exceed by many hundredfold the expenditures, reckless as they may now appear.

THE GAZETTE.

But these one hundred and fifty "sealed books" failed almost wholly to supply the public want, and a year later were supplemented by the Official Gazette, substantially in its present form, eight copies of which are furnished to each member of Congress for distribution in his district, and about four thousand sold annually to subscribers.

PRINTING THE SPECIFICATIONS.

So much has been done for the public exclusively. For the use of the public and the office reciprocally, after repeated recommendations and the most urgent solicitations by many Commissioners, the office was authorized in 1861 to print ten copies of the current specifications and drawings. Prior to that time the specifications appeared only in manuscript, and there were no duplicate drawings, but as Commissioner Holloway deplorably says, in his next annual report:

After a trial of eight months the work was discontinued on account of the expense, and the section of the law authorizing the printing subsequently repealed.

But such were the demands within and without the office for this work that in 1866 Congress was forced to reconsider its action and renew the publication, authorizing the printing of twenty copies now instead of ten, and in 1871, when their value began to be appreciated, increasing the number to one hundred and fifty copies, at many times the expense which was thought too great ten years before, the office and the public meantime having been denied the advantage of the work for that period.

The back printing has not, owing to inadequate appropriations, been wholly completed, and although at the beginning apparently so expensive as to make this an insuperable objection to its undertaking, it has been demonstrated by the experience of the office that by selling the copies at ten cents apiece, the office price, they will in time return to the patent fund substantially all that has been expended in their preparation, while the office has the use of all the copies it requires.

These constitute all the publications of the office for public and official use, except certain indexes which have no particular value.

Of the Reports and Gazettes there are 99 volumes, and of the printed specifications and drawings in the office, 782, leaving 230 in manuscript.

The business of the office has grown from 443 patents in 1840, representing about 265 subjects of invention, to 16,584 patents in 1881, representing 3,147 subjects of invention. Among these subjects, or sub-classes, the 268,662 patents issued up to the present date are variously distributed, varying from ten to twenty in the smaller classes to several hundred in the larger ones.

IMPORTANCE OF ABRIDGMENT.

The importance of an abridgment such as is contemplated, and has been begun under act of Congress, becomes apparent at this point. Invention is no longer primitive, visionary, unskilled, and, I might add, despised, as in its earlier days, but practical, professional, skilled, and honored, including within its ranks some of the most gifted, progressive, and cultivated minds in the land, grappling with the most profound and abstruse principles in science and art, and developing interests of such vast and valuable import that we find in their achievements the proudest monuments of our civilization and an exhaustless mine of wealth and power.

In nearly all of the 3,147 subjects into which invention is divided by the office men are exclusively engaged in developing a particular art, and in some there are many hundreds so employed, but the products of their labors are improvements rather than original devices. How many thousands of patents are built upon the ideas first advanced by Fitch, Whitney, Morse, Howe, McCormick, Hoe, Brown, and others who are recognized as the founders of our useful arts!

But to make an improvement one should know what has been done before, and all that has been done.

FACILITIES FOR EXAMINATIONS.

What facilities are furnished American inventors for obtaining this all-important information? Only those already enumerated, namely, the Reports and Gazette, or the thousand and odd volumes of specifications throughout which the various classes are scattered and buried, or the printed specifications and drawings, which the office sells at ten cents each. An inventor can order all of a particu-

lar class that has been printed in this way, and pay from a few to several hundred dollars for it, but if he be poor, as most inventors are, the field in which he is engaged will remain covered as by Egyptian darkness until he has filed his application, minus office and attorney's fees, when the reference may show that his invention was known and patented years before.

But if a classified abridgment of that art were available in the nearest public library or other known depository, or were purchasable at the office for a reasonable sum, the inventor would be protected and the office spared the labor and expense of examining his worthless application.

PERCENTAGE OF REJECTIONS.

Some years ago as high as two-thirds of all applications were rejected for want of novelty, case after case coming in for the same thing. The reports gave the inventors some light, and the ratio of rejections was reduced, but they have continually been too great, and mainly because inventors have not been able to inform themselves in the arts. The applications in 1881 were 26,059 to 16,584 patents, leaving 9,470 rejections, over one-third of all.

ITS VALUE TO INVENTORS.

A classified abridgment would become the inventor's hand-book and companion, and be of more value to him than all the publications now extant for his benefit and published at great expense to the Government.

It would give him the information he absolutely needs to proceed intelligently and successfully, and while it saved him most of the labor, expense, and disappointment represented in the thousands of applications annually rejected, and to that extent limited the force and expense of the office, it would contribute greatly to the improvement and perfection of the arts by raising the standard of the inventions presented.

ITS VALUE TO MANUFACTURERS.

On its value to manufacturers there is not time to elaborate, but here, as with inventors, there is special need for such a work. From the smallest patented article to the greatest, manufacture runs in certain lines, and the proprietor is compelled to have a knowledge of the art in which he is engaged before he can proceed, with due business-like caution and judgment, in the production of his wares. In his dealings with inventors, in litigation, in the improvement of his own productions, he must be wholly and reliably informed.

ITS VALUE TO THE OFFICE.

Its value to the Patent Office would be simply incalculable. Here there is now no classified subject-matter index whatever to inventions. To supply this great want classifications have been made which bring together, as nearly as possible, all the patents of a particular kind in a sub-class, but after doing the best it can in this way, the office has failed to make a complete and satisfactory arrangement, for the reason that important devices are often associated with others of equal or greater importance, and in the classification go with them to some other class, or even division, where they are only found, if at all, after prolonged and diligent search.

A subject-matter index would at once point them out to the examiner and assure an exhaustive search in a comparatively brief space of time, instead of requiring hours and days for the same work, as under the present method. Indeed, so important and valuable would be a well-indexed classification of this kind that it would in a few years save enough in the total expense of increased service to meet the cost of its preparation. It would be equal in each examiner's division to at least one man at \$1,200, and, as there are twenty-six divisions, the annual saving would exceed \$31,000. The Government is daily patenting labor-saving machinery for other departments of industry, but here is an opportunity to do something for itself which is not surpassed in labor and money-saving merit by anything that can be introduced into this branch of its service.

ENGLISH ABRIDGMENTS.

Its practical value is further shown by the English abridgments. Although there are less than 150,000 English patents to-day, the English Government began twenty-five years ago to make an abridgment, with exhaustive cross-references, to which our examiners can go and readily find, within classified volumes, all that their art discloses.

The English publications, although not more obscure than our own, are thus brought within convenient and speedy reference, and it would be considered a hardship unbearable and a labor unending if the examiners and attorneys who have much use for these were compelled to surrender the abridgments; yet there are no arguments in their favor which are not of greater force when applied to American patents.

The English, it is well known, make no preliminary official examinations. Whoever applies may, by paying the required fees, obtain a patent. The abridgment is of no value to their patent office, and patentees at last have to ascertain their rights in the courts; but here there is a critical and prolonged preliminary inquiry of a semi-judicial character by the office; so that this work, by increasing largely the percentage of certainty and correctness of official action, would give a standing and value to our patents in this country and abroad which they never yet have obtained, and vindicate, in a most satisfactory way, the superiority of our system.

EXPENSE OF PRINTING.

If objection be made on account of its expense the answer will be found in the following figures, which any practical printer will say are liberal and would yield a good profit in any well-managed private establishment:

	Volumes.
Single edition, containing 5,000 patents.....	6,000
Free distribution provided for by law.....	3,000
Leaving.....	3,000
COST.	
Abridging, at \$2 per page.....	\$2,000
Printing, at \$1.20 per page.....	1,200
Photolithographing, at \$6.75 per page, (the present cost of Official Gazette).....	6,750
Indexing 100 pages, at \$15 per page.....	1,500
Pasting dummies, per edition.....	100
	11,550
CREDIT.	
3,000 volumes, at \$4 per volume.....	12,000
3,000 volumes to libraries, free.....	
Balance over cost.....	450

The edition might be increased to 10,000 by adding the cost of press-work and paper, which would be comparatively small, and there is scarcely a doubt that in ten years after the last volume was printed the Government would be reimbursed out of the sales for every penny it expended in this behalf.

Now, Mr. Chairman, it will be seen by the above itemized statement of expense of printing the abridgment of 5,000 patents in an edition of 6,000 volumes of about 1,200 pages you have a total cost of \$11,500. This is regarded as a very liberal allowance, and hundreds of private establishments can be found to take the work at this price. Applying this estimate to the whole number of patents issued, 268,682, there would be a total of fifty-four volumes costing \$621,000.

The issues running from the present up to the time when the back work will be completed, will of course add to the number and cost of the publications, and the time when this work shall be brought up to the current issues will depend on the liberality of Congressional appropriations; but it is clear that it will cost no more now than in ten or fifteen years hence, while the aggregate will then be swollen by the issues of those years and only make the demand for the abridgment so much the more imperative.

And right here I would like to impress you with the irresistible demands for this work. It is a specter that will not down at Congressional bidding, but with the vast and immeasurable growth of invention in this country becomes more and more importunate every day. That it must be done eventually, whatever the cost, is as absolutely certain as that the volume of patents will in comparatively few years reach such stupendous proportions that both private and official examinations will be impossible without it. Therefore the only open question now is whether the work shall be pushed to completion from the present or be abandoned until it has grown well-nigh insurmountable.

The cost is a fruitful source of objection, but, as has been said, it will never be less, and I find in the table of reports and their cost that in the years 1858-'59-'60, \$343,051, and in the years 1866-'67-'68, \$558,778, were appropriated out of the Treasury of the United States for printing the Patent Office Reports, over half as much in the first three years as is now asked for, and almost equally as much in the last three, while the actual value of those publications will scarcely bear comparison with what is now proposed.

I assume, too, that inventors have certain interests in the \$1,800,000 credited in the Treasury of the United States to the Patent Office, which ought to be considered in this connection. As this fund accumulates propositions are annually made in Congress to divert it from its legitimate uses to educational or other enterprises entirely foreign to our patent system. Does it not seem the part of duty as well as of wisdom and sound policy that it should be taken from the idleness which is suggested by these threatening propositions and employed in a channel where it would be fruitful of so much good to inventors and the public?

But, as you have observed, the increase of this fund is at the rate of \$300,000 annually, the increase of a single year being sufficient to meet half of the expense of a complete abridgment of all the patents now issued.

I call your attention also to the accompanying extracts from the annual reports of several successive Commissioners, all of whom agree that though this work will require a present outlay for its preparation, it will, as General Leggett said, not only be "profitable in the way of furnishing much needed information but be remunerative to the Government."

EXTRACTS FROM COMMISSIONERS' REPORTS.

General M. D. Leggett, in 1873, said:

It is very desirable that a thorough digest, showing clearly and fully the present state of the art in each one of these classes, should be made.

This is a work that will need to be commenced very soon. The industry of the country, the interests of inventors and manufacturers, as well as the facility of the office work, demand such digest.

If a competent person could take the subject of "fire-arms," for instance, giving the present state of the art in that class by showing exactly what has been invented, and by whom, from time to time, and the improvements that have been made, it would enable the office to make examinations with far greater facility

and accuracy, and in much less time than at present; would enable manufacturers to know more exactly their own rights and the rights of patentees and the public; would enable attorneys and patent solicitors to prepare their cases with far more intelligence and precision, and would greatly assist the Commissioner of Patents and the judges of the courts in deciding questions of patentability, interference, and infringements. If such volumes could be prepared under supervision of the Commissioner of Patents, and be published in sufficient numbers to supply the demand for the same, I am convinced they could be made not only profitable in the way of furnishing much-needed information but remunerative to the Government. I would respectfully ask the attention of Congress to this matter, and that the Commissioner be authorized to immediately commence this work.

Hon. J. M. Thacher, in 1875, said:

There is also urgent need of complete digests of all the patents in each one of the one hundred and forty-five subdivisions, as inventions have been classified in the office. These would render the work of examining more expeditious and certain. The English Government has published such digests. These contain, in greatly abridged form, properly classified and arranged, all the patents issued by the government, and appear to have met with great favor. There is also a strong demand for the publication of such abridgment of specifications in this country. If the Commissioner should be authorized to publish the volumes as fast as completed, in form something like that of the English abridgments, they would doubtless meet with a ready sale, which would nearly if not cover all expense of publication. So seriously is the want of this abridgment felt by inventors and manufacturers that every year examiners in the Patent Office are importuned by persons outside to prepare complete abridgments of patents in their class for publication and sale as a private enterprise; and in some instances large sums have been offered for complete digests of some special classes.

GENERAL ELLIS SPEAR, 1878.

These abridgments contain in classified form brief summaries of the inventions patented in Great Britain. Each volume contains some special class of inventions, arranged chronologically, and with subject-matter indexes. And one desiring to be fully and accurately informed in relation to the patents granted in that country in all classes of inventions may readily glean the information from the volume of abridgments, without which he would be compelled to search laboriously through the great mass of patents issued, now amounting to over 1,700 volumes.

These indexes would enable one searching for special information to perform in a few moments the work of a day. They would effect a saving to the office greater than their cost, and would find a ready sale at remunerative prices among manufacturers and inventors. The need of them increases each year with the increase of the number of patents, and if generally distributed they would serve more effectually than any other means to defeat those who, throughout the country, under worthless patents of narrow scope, impose upon the unwary and ill-advised.

Hon. Halbert E. Paine, 1879, quotes from Commissioner Ewbank in 1848, as follows:

In a pecuniary point of view, such a work is therefore most desirable to this office, to inventors, and the public at large. When made accessible to popular reference it will be the saving of millions. No state paper could surpass it in importance, nor in lasting value. Till it is done a majority of applicants for patents must continue to meet with some disappointment. The only safe rule with them is always to make themselves acquainted with what has been attempted before incurring a serious outlay. They should never presume that their devices have not entered other heads than their own until, by a searching inquiry on every hand, the presumption remains in their favor unimpaired. No better advice than this can be given them. But how are they to follow it? Nineteen-twentieths have few or no reliable sources of information within their reach, and not one in a hundred can afford the expense of a visit to Washington and a residence there for the purpose of consulting the office records and library.

And Commissioner Paine adds:

Each succeeding year has augmented the force of most of the reasons suggested by Commissioner Ewbank for the preparation of this index. It is impossible now to estimate the advantages which inventors, the public, and this office would derive from such a work if it were in the hands of the examiners and accessible to the public. The saving of time and money which would result from its use to the office would be immense. It is, of course, impossible to estimate the millions that would be saved to inventors and to those who use inventions if the knowledge which it would furnish could be accessible to them.

Mr. Commissioner Marble, in his report for 1880, thus forcibly and, as it would seem, unanswerably, sums up the arguments in its behalf:

Nearly 240,000 patents have already been issued by this office. If the examination of the office upon applications filed were limited to American patents only, the necessity for a digest of such patents would, to any person at all acquainted with the business of this office, be apparent; but when to this number of patents are added those issued in foreign countries as well as the inventions described in scientific and other works, the importance of such a digest, in order that an examiner may know what the state of the particular art is, cannot be overestimated. As well might it be expected that a lawyer could promptly tell what the law is upon a given subject from the isolated decisions found in the reports of the decisions of the courts of this and other countries, without a digest of such decisions, as that an examiner, although an expert in the particular class, can determine from the great number of inventions already patented, as well as those described in books and publications, whether a particular device or composition of matter is patentable without some book in which reference is made to all the patents which have been issued in that particular class, as well as the inventions described in books and publications.

The advantage to the public, and especially to inventors and manufacturers, would be incalculable. Inventors often spend months, and even years, in producing a device to do a certain thing, only to find at the end of the time thus spent that their inventions have been fully anticipated by other devices, if not identical with the one presented, in all respects similar to it.

Had the preparation of such a work been commenced when it was most urgently recommended by Mr. Commissioner Ewbank, more than thirty years ago, and after its publication annually kept up, many useless and worthless patents would not have been granted, and its cost to the Government, in my opinion, would have been many times saved.

For the foregoing reasons, and for reasons which have been given by my predecessors in their reports on this subject, I earnestly recommend that action be taken by Congress looking to an early commencement of the preparation of this work.

Hon. V. D. Stockbridge, Acting Commissioner, in the annual report for the year 1881, says:

The digest of American patents, for which a provisional appropriation was made by Congress at its last session, has been in progress since the beginning of August last. It is proposed to furnish to the office and the public at large classified briefs of all American patents. The classification in the body of the work will conform in general to that already existing in the several examining divisions, while the indices will contain cross-references to every sub-device which is of sufficient importance to be described in the specification of the invention to which it belongs. Thus the examiner or the inventor will not only have at hand an adequate digest of each case under its proper classification but he can dispense with a search that is often very laborious for references in the broader classes under which the special invention is comprised. It is hardly possible to overestimate the benefit that will inure to the office and to inventors from the prosecution of this work.

General Thacher says:

They would doubtless meet with a ready sale, which would nearly if not cover all expense of publication.

General Spear says:

They would effect a saving to the office greater than the cost, and would find a ready sale at remunerative prices.

General Marble says:

Its cost to the Government would have been many times saved if the work had been begun when first recommended and kept up annually thereafter. This will not be disputed by any man informed on the subject.

It is the undivided opinion of men who are informed on the subject that the sales would easily cover all expenses. It is therefore a mere loan rather than a permanent outlay that is asked for. Like the printed specifications which were begun and then discontinued on account of the fabulous sum which alarmists said they would cost, but in time had to be produced, and have become instead a source of revenue, so it will be with this work. Patent attorneys, manufacturers, and inventors must and will have it, and I venture the prediction that in ten years from its completion the small edition of 3,000 proposed for sale will be almost if not wholly exhausted; yet these 3,000 volumes will pay the whole expense of printing.

This is not mere guess-work, but is demonstrated by the demand for all sorts of office publications. A full set of the Reports, of which, as you have seen, 2,139,449 volumes were printed, and the Gazettes succeeding them up to date cannot be purchased at less than \$150, and are very difficult to obtain at those figures; yet the demand for them is increasing with the rapid expansion of the patent business.

I call your attention also to certain publications compiled and abridged by employees of the office out of hours, in response to urgent solicitations by parties outside interested in the classes in which they are employed. These books cover certain subdivisions, and are sold in limited editions. The size and price of a few of them are as follows:

Paving and roofing compositions, 120 pages, \$10; cotton-bale ties, 161 pages, \$10; sewing-machine attachments, 140 pages, \$25; middlings purifiers, 113 pages, \$25; cultivators, wheel plows, &c., 1,100 pages, \$50.

These five volumes cost in the aggregate \$120, but if abridged by the office would cost not exceeding \$6.

PRINTED SPECIFICATIONS.

The printed specifications and photolithographs, which were so bitterly antagonized and so difficult to obtain, enforce the argument. The following table shows what was done in this line in the year 1881:

Cash sales:	Copies.	Amount.
Hand coupons.....	57,846	\$5,784 60
Mail coupons.....	67,317	6,731 70
Cash by latter.....	143,381	16,517 00
Cash for classes and sub-classes.....	42,304	4,230 40
Subscribers to weekly issues.....	21,599	2,159 90
Total.....	332,447	35,423 60
Copies furnished—		
Co-ordinate branches of the Government.....	9,021	902 10
Foreign exchange.....	343,044	34,304 40
Bound volumes.....	109,650	10,965 00
Examiners' rooms.....	21,749	2,174 90
Files.....	17,365	1,736 50
Official Gazette.....	32,028	3,202 80
Patents and folios.....	52,095	5,209 50
Bound volumes, records.....	34,730	3,473 00
Abridgments.....	6,403	640 30
Total.....	626,085	62,208 50
Total cash.....	332,447	35,423 60
Total free.....	626,085	62,208 50
Grand total.....	959,532	97,632 10

These figures not only establish the inestimable value of the printed specifications, without which the business of the office could not be performed, but the cash sales forcibly demonstrate the importance of the proposed work.

It will be seen that twenty-two patents, costing \$2.20, were sold for every patent issued during the year, and these largely passed into the hands of attorneys, inventors, and manufacturers, who had occasion to make exhaustive searches in certain lines, or purchased them to file in the classes to which they belong, and which have been purchased of the Government at great expense. But as comparatively few men are able to make these purchases as extensively as they require, those particularly who live out of Washington and

cannot avail themselves of the office classifications are placed at a great disadvantage and necessarily suffer much inconvenience and loss thereby. It is a work, therefore, directly in the interest of the many against the few who are favored with capital or the advantage of location at the seat of Government.

BINDING.

There was no mention of binding in any statement, of expense for the reason that bound volumes will be in small demand, and outside of the personal copies to members of Congress and those for office use the cost of binding might be added to the selling price. If the volumes that go to libraries were simply stitched together or bound in paper like the English abridgments, they would be in the best form for binding in the standard style of the particular library which received them, each having a style of its own. You see each office volume will cover a number of classes, and a library may choose to bind each of these classes separately, or certain ones on kindred subjects together, and thus make at least several volumes out of one. This would make the work available for reference to more than one person at a time, and be more convenient, but for the sake of economy and to observe a degree of uniformity in its publications the office will make volumes of about 1,200 pages, the standard office size.

To illustrate what I mean, take the class of "plows" for example. This is the title of a class in the division of agriculture, under which there are thirty-three sub-classes, as follows:

Attachments.....	38	Landsides.....	21
Beams.....	35	Mold-boards.....	76
Cleaners.....	63	Plows.....	686
Clevises.....	162	Plows, ditching.....	122
Corn-coverers.....	21	Plows, hand.....	121
Colters.....	120	Plows, mole.....	105
Couplings.....	54	Plows, shovel.....	307
Cotton choppers.....	173	Plows, sidehill.....	146
Cotton-scrapers.....	47	Plows, steam.....	159
Cultivators.....	752	Plows, wheel.....	1,005
Cultivators, parallel.....	82	Points.....	82
Cultivators, rotary.....	163	Revolving mold-boards.....	44
Cultivators, straddle-row.....	114	Ridgers.....	21
Cultivators, wheel.....	1,019	Standards.....	27
Cultivator teeth.....	171	Subsoilers.....	123
Fenders.....	95	Weed-turners.....	38
Handles.....	19		

It will be seen that certain natural subdivisions other than those made by the office occur in this table, such, for example, as relate to the cultivation of cotton, and are found under cotton-scrapers and cotton-choppers; ditching and mole-plows; cultivators, with their several subdivisions, and plows with their various attachments, such as landsides, mold-boards, colters, clevises, &c.

A very satisfactory knowledge of the state of the art can be obtained by examining in the sub-classes, but to be thoroughly and wholly informed one would want to look through the entire class, and this could be easily and quickly done by means of the general subject-matter index which each volume will contain.

Then, again, inventors and manufacturers, as a rule, will order certain sub-classes in which they are specially interested, just as they are constantly doing now, but at a vast saving in the cost when abridged, as will be shown below.

The figures in the foregoing table denote the number of patents in the respective sub-classes up to present date, and make a total of 6,411. The range, it will be seen, is from 19 in handles, to 1,019 in wheel-cultivators. To order the smallest class at present office rates would cost \$1.90, or within ten cents of half the price fixed for a volume containing 5,000 abridged and indexed patents, and to order the largest would cost \$101.90, while the total cost of the class of plows would be \$641.10. As abridged it would cost not exceeding \$5.25, and be infinitely preferable for all practical purposes, as well as be available to purchase, which it is not at present prices.

A TRAINED FORCE.

It must be clear from these facts that it is only a question of time when the Government will be obliged to do this work, and go over all the ground from the beginning substantially in the manner which is now proposed. Is it not better, then, that it should be prosecuted from to-day when a force trained at great labor, and with considerable expense, is employed to carry it forward? The temporary outlay it involves comes out of an accumulated inventors' fund, amounting now to nearly \$2,000,000, and increasing at the rate of a quarter of a million yearly.

PROGRESS OF THE WORK.

The office has abridgments substantially ready for two volumes, and is working on cases for the third, which will comprise all the patents in the division of agriculture, divided as follows:

Plows.....	6,411
Seeders and planters.....	4,569
Harrows and diggers.....	2,517
Garden and orchard.....	781
Total.....	14,281

This work has already been accomplished, but is no indication of what can be done by even the present force as it is now organized and trained, for it must not be forgotten that the abridgment was begun under great embarrassments, without precedent or chart to point the way. The best methods were not known, but had to be ascertained by the slow and tedious process of experiment.

In conclusion I will submit for the consideration of members of this House a comparative statement of the business of the Patent Office from 1837 to 1881 inclusive.

Year.	Applica- tions.	Caveats filed.	Patents and re- issues.	Cash re- ceived.	Cash ex- pended.	Surplus.
1837			435	\$29,289 08	\$33,506 98	
1838			530	42,123 54	37,402 10	\$4,721 44
1839			425	37,260 00	34,543 51	2,716 49
1840	735	228	473	38,059 51	39,020 67	
1841	847	312	495	40,413 01	52,666 87	
1842	761	301	517	36,505 68	31,241 48	5,264 20
1843	819	315	510	35,315 81	30,776 96	4,538 85
1844	1,045	380	495	42,509 20	36,244 73	6,264 53
1845	1,246	452	504	51,076 14	39,395 65	11,680 49
1846	1,272	448	638	50,264 16	46,158 71	4,105 45
1847	1,531	553	569	63,111 19	41,878 35	21,232 84
1848	1,628	607	652	67,576 69	58,905 84	8,670 85
1849	1,955	595	1,068	80,752 98	77,716 44	3,036 54
1850	2,193	602	993	86,927 05	80,100 95	6,816 10
1851	2,258	760	872	95,738 61	86,916 93	8,821 68
1852	2,639	996	1,019	112,656 34	95,916 91	16,739 43
1853	2,673	901	961	121,527 45	132,869 83	
1854	3,328	868	1,844	163,789 84	167,146 32	
1855	4,435	906	2,012	216,459 35	179,540 33	36,919 02
1856	4,960	1,024	2,506	192,588 02	199,931 02	
1857	4,771	1,010	2,896	196,132 01	211,582 09	
1858	5,364	934	3,695	203,716 16	193,193 74	10,522 42
1859	6,225	1,097	4,504	245,942 15	210,278 41	35,663 74
1860	7,653	1,084	4,778	256,352 50	252,820 80	3,531 79
1861	4,643	700	3,329	137,354 44	221,491 91	
1862	5,033	824	3,532	215,754 99	182,810 39	32,944 60
1863	6,014	787	4,184	195,593 29	189,414 14	6,179 15
1864	6,932	1,063	5,025	240,919 98	229,868 00	11,051 98
1865	10,664	1,837	6,616	348,791 84	274,199 34	74,592 50
1866	15,269	2,723	9,458	495,665 38	361,724 28	133,941 10
1867	21,276	3,597	13,024	646,581 92	639,263 32	7,318 60
1868	20,420	3,705	13,410	781,565 66	628,679 77	152,886 09
1869	19,271	3,624	13,997	693,145 81	486,430 78	206,715 03
1870	19,171	3,273	13,333	669,456 76	557,149 19	112,307 57

Statement of balance in the Treasury of the United States on account of the patent fund.

Amount to the credit of the fund January 1, 1881.....	\$1,631,626 71
Amount of receipts during the year 1881.....	853,665 89
Total.....	2,485,292 60
Deduct expenditures for year 1881.....	605,173 28
Balance January 1, 1882.....	1,880,119 32

These figures, Mr. Chairman, are far more eloquent than the high flights of rhetoric sometimes resorted to by the demagogue to make a noise for merely personal or selfish purposes, or the sophist, whose artful use of logic succeeds in convincing his hearers of the correctness of a proposition based on false premises.

Surely this Congress, which has been notoriously liberal in expending the people's money, wrung from them by taxation, can be equally liberal in permitting the Patent Office to expend a few thousand dollars of its own earnings for the benefit of the Government, for the benefit of all classes of our people, and by continuing the printing of the abridgment of patents "promote the useful arts."

Internal-Revenue Taxation.

SPEECH

OF

HON. E. JOHN ELLIS,

OF LOUISIANA,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, June 27, 1882,

On the bill to reduce internal-revenue taxation.

Mr. ELLIS said:

Mr. SPEAKER: Although a member of this House has drawn about this bill the "awful circle" of partisan fealty, and declared in substance that the Democrat who voted for it was a "traitor to the Democratic party," I shall nevertheless give to it the sanction of my support; and as I must give an account to the people who sent me here for the votes which I cast, I propose briefly to announce the reasons which guide me in my course upon the measure.

Sir, the Democratic party for years has been clamoring for relief from excessive and useless taxation. I, as a Democrat, have joined in that clamor. From a plane, too, higher, more exalted, and more impartial than the stand-point of mere partisanship—that of an American Representative who prefers the interests of the whole people to those of any party—I have raised my voice and given my vote to measures looking to the lifting of excessive taxation from the lives and labors of a burdened people.

And shall I now, at the first tangible and practical opportunity that has been presented to begin this work of reduction, falsify by my act my plighted word, and refuse a measure that gives partial relief because the full measure of alleviation which my judgment demands cannot now be obtained?

This bill does inaugurate reform in taxation. It relieves certain agricultural interests by lightening the burdens imposed upon them. It takes away burdens borne by the people. It affords relief to every individual of our broad country who lights a match or draws a check, or borrows money from a bank, or cultivates tobacco. Shall I refuse this proffered relief on behalf of the toiling thousands who sent me here to voice them because I cannot strike down all the burdens beneath which they bend? What folly to expect me to do so! Mr. Speaker, I have heard some strange doctrine announced during this debate. Honorable gentlemen have declaimed in words fierce and bristling with all the essentials of eloquence, except good judgment and sound sense, that this bill was a measure of relief intended and devised only for the benefit of national bankers. Suppose it is. Bankers are useful people and banks are necessary institutions. And I know nothing of either that should place them outside the pale of support and protection and care by wise and judicious legislation. And if this tax upon capital and deposits bears heavily upon banks and bankers, why not strike it down? Shall we refuse to do so only because we cannot at the same time strike down the burdens of other classes of our people? Such an argument can only be founded in a spirit of puerile spite that does not become one who sits here clad with the ephod of a high priest of the people.

But, sir, I deny that this bill is in the interest of the bankers. I hold it to be directly in the interest of the whole people. Do gentlemen suppose that the national banks pay the taxes imposed upon them in the shape of taxes upon capital and deposits? It is not pretended that the people do not pay the stamp tax on bank checks. This amounts to nearly \$2,000,000 per annum. Every merchant, lawyer, doctor, farmer, mechanic, laborer, who draws a check helps to pay this tax. True, it is a small tax, and the relief by its abolition is small, but it is relief to the whole people. Upon what principle can a representative of the people refuse to vote for it?

But, sir, I go further, and hold that the proposal by this bill to abolish the tax upon capital and deposits is a measure of relief not for the banks or bankers but for the people, and more especially for that portion of them who constitute the creditor class.

Does the banker pay this tax? He does in the first instance, it is true. He pays the tax exactly as the importer pays the duty on the fabric which he imports. He imports the article, pays the duty, and then adds the price of the duty to the price of the article, and the consumer who eats or wears or uses the article repays the tax originally paid by the importer. And so the banker pays the tax imposed upon the capital and deposits of his bank. But he charges it to the borrower in the increased rate of interest which he exacts. Who is the borrower? The people; business men of every class; and the poorer the borrower the more dependent his condition, the more absolutely is he bound to accept such terms as the lender, the banker, may see fit to impose.

The tax imposed upon capital, deposits, and bank checks amounts to nearly \$8,000,000 per annum. This sum amounts to about 1½ per cent. upon the total national banking capital of the country, which amounts in round numbers to \$470,000,000.

Sir, is not the proposition to remove this tax a proposition to cheapen money, and to lower rates of interest? Is this in the interest of the banker, who is the lender? Is it not rather in the interest of the borrowers, who constitute the vast mass of the people? What is money but a lubricator of business, the universal oil that facilitates the progress of business? What business interest is represented on this floor, or in this country, that can be conducted without money? Not one.

The proposition, then, to cheapen money is a movement directly for the benefit of every business interest in our broad Union. But, sir, looking to my own constituents, what do I find their interest to be with regard to this bill? I represent a few bankers, but by far the largest portion of those who sent me here are planters, merchants, and laborers engaged in planting and mechanics. To conduct their business requires money. "Interest doth eat as a moth," and they are kept poor, and their progress toward wealth and ease is retarded by dear money, high rates of interest. There are planters in my district, and in Louisiana, whose planting operations demand each year an outlay of hundreds of thousands of dollars. They pay at rates that run from 7 to 10 per cent. for the money they use. If this bill passes the banks can afford to advance at rates 1½ per cent. cheaper money to conduct their plantations, to make and move their sugar to market. I roughly estimate that it requires \$35,000,000 to raise and move the sugar and rice crops of Louisiana. The planters pay interest upon this sum.

Now the measure under discussion proposes to relieve the capital

borrowed by these planters from a tax of 1½ per cent., and the bankers can afford to loan the planters of Louisiana the \$35,000,000 1½ per cent. lower than heretofore, which will save them in interest about \$612,500.

Sir, if fealty to the Democratic party requires me to neglect and refuse to guard the interests of those who sent me here I shall act outside of and independent of that party; I shall go for cheaper money for my planting friends, let party leaders crack their whip as they may.

But look at the South. I estimate roughly that \$500,000,000 are annually required to raise and move her crops of cotton, tobacco, rice, sugar, and wheat. A rate of interest 1½ per cent. cheaper will save to her people \$8,725,000 per annum. Look at her magnificent natural resources, requiring but capital for such development as to transfer to her brow the crown of industrial, agricultural, and commercial supremacy. What son of hers, representing here her honor and her interest, can refuse to support a measure which cheapens capital and brings it nearer to her grasp and hastens the advent of her coronation?

Sir, if it be Democracy to oppose measures looking to such consummation, I am not a Democrat. If what I have said and shall do in advocacy of this measure be treason to the Democratic party, be it so; I am guilty of treason, and "the party" can "make the most of it."

The fallacy of the so-called outlet system as applied to the Mississippi.

SPEECH

OF

HON. EDWARD W. ROBERTSON,

OF LOUISIANA,

IN THE HOUSE OF REPRESENTATIVES,

Friday, June 9, 1882,

On the bill (H. R. No. 6242) making appropriations for the construction, repair, and preservation of certain works on rivers and harbors, and for other purposes.

Mr. ROBERTSON said:

Mr. SPEAKER: The long standing conflict between the rival plans for improving the Mississippi properly ended with the creation of the Mississippi River commission in June, 1879. This board of experts—skilled engineers of great practical experience and world-wide reputation—was created by an almost unanimous vote in both House and Senate. They were instructed to investigate and report upon the rival theories of improvement known as the jetty system, the levee system, and the outlet system. They have made careful investigations, and submitted to Congress three annual reports. They have decided upon a plan of improvement, and it should be considered final and conclusive, unless when carried into practical operation it is proven to be defective. And until so proven all further discussion of theories should cease, so far as Congress is concerned.

But two committees of this House, the Committee on Levees and Improvement of the Mississippi and the Committee on Commerce, thought otherwise and opened their doors to a re-examination of theories and hydraulic science. I would regret this action except that it resulted in reasserting their confidence in the plan of the commission and in recondemning the outlet theory. My only excuse for discussing the last-mentioned theory upon this occasion is to emphasize its condemnation, to denounce it as an instrument of danger to the river itself, and of destruction and terror to the valley. Rightly named it is the "crevasse system," and all who have read the newspaper accounts of the recent flood in the Mississippi Valley know the terrible significance of that term.

What do the commission say of it? I will briefly quote from their annual reports and their testimony before the committees of this House. But let me first ask that you bear in mind that there is a wide and fundamental distinction between the laws governing sediment-bearing and clear-water streams. The Mississippi, as we all know, belongs to the former class, and crevasses in its banks are attended with different results from crevasses and overflows in the banks of rivers which do not bear sediment.

OPINION OF THE MISSISSIPPI RIVER COMMISSION.

In the first report of the commission, submitted in 1880, they say of outlets or crevasses:

It has been supposed by many persons that, because the immediate effect of a crevasse during a flood is the reduction of the height of the river's surface in the vicinity of the crevasse and below it, lateral outlets, either natural or artificial, by which the flood-waters of the river are drawn off and conveyed through a shorter route to the sea, tend to prevent the recurrence of destructive floods, by supplying additional avenues for their escape. This method would undoubtedly be effective if the flood-waters of the Mississippi were not highly charged with sedimentary matters, which are held in suspension in the water by the current. To support this immense mass of earth and sand in suspension, and thus insure its

transportation to the Gulf, the velocity of the current must be sustained. Without stopping to determine, or even discuss, the character of the relation which exists between the various velocities of current and the proportionate quantities of sediment which such velocities are capable of carrying in suspension, the fact seems to be established that when the current is checked in its natural flow during floods, a deposit of sediment will occur.

Shoals are found in the river immediately below crevasses, which it is difficult to refer to any other cause than the loss of current velocity which takes place below the crevasse. As a portion of the volume of the river is drawn off by the crevasse when it is first made, it is impossible that the current below the crevasse can then be as rapid as it was before its occurrence. Being less rapid, it is unable to sustain the whole quantity of matter held in suspension by the more rapid current above the outlet, and consequently its surplus sediment falls to the bottom below the crevasse. This deposition continues until the size of the river below the crevasse has been so reduced by the shoaling that the current is again restored through the short distance in which the bottom of the river has been thus raised and the channel diminished. If the crevasse remained open, however, for several years, it is evident that the shoal will continue to extend down the stream, for the reduced velocity will still exist in the river below the shoal. If the crevasse be kept open indefinitely, the shoaling will continue to extend down the stream until certain other injurious effects are produced, which will be presently referred to.

As the system of improvement proposed by the commission is based upon a conservation of the flood-waters of the river, and their concentration into one channel of an approximately uniform width, it would seem scarcely necessary further to consider a system based upon theories and arguments so diametrically opposed to it as the outlet system is thus shown to be.

In their second report, submitted in 1881, they give the report of a sub-committee, containing the following:

The present drift of the condition of the river is steadily from bad to worse. The logical end is banks rising only to the level of the swamps, with the loss made up by additional height of levees, which will then range from fifteen to twenty-five feet. Breaks in such levees mean destructive floods and the loss of navigation. The alternative is the abandonment of the production and commerce of the valley.

In their third annual report, recently submitted, they say:

It may be said of outlets (which term we restrict to well-defined depressions connecting the river with the swamps and their drains on either side, while it is still within its banks) that whenever they are directly connected with the improvement and maintenance of navigation they should be efficiently and permanently closed.

General Gilmore, president of the commission, in his recent testimony before the Committee on Commerce said:

It is perhaps well at this time, when certain engineering heresies are struggling into unusual and mischievous prominence, that we should verify our bearings and re-examine, and if admissible, reaffirm those physical laws upon which the plan of improvement of the Mississippi River, recommended by the commission, is avowedly based, because upon the soundness and correct interpretation of those laws that plan unquestionably rests for success.

With respect to silt-bearing streams flowing through alluvial deposit, it is admitted by all engineers of standing and repute that they always carry more or less solid earthy matter, and that any reduction of velocity will lessen the sustaining and transporting power of the water and cause a deposit of solid matter at the bottom. The direct results will be that both the bed of stream and therefore the surface slope of the water are raised up. Conversely, if the velocity of the water be increased from any cause—and an increase of volume of flow is one certain cause of increased velocity—a greater amount of silt will be thrown into suspension and carried along, and this increment will be supplied by erosion of the bottom. There will then ensue a lowering of both the bed of the stream and the surface slope.

The outlet system being one of diffusion and waste, and not of concentration, it is difficult to understand how it can commend itself to any engineer of intelligence and sound judgment. It rests entirely upon the broad theoretical assertion that outlets, either natural or artificial, which shall draw off the flood-waters of a river and convey them away by independent routes to the sea will tend to prevent the recurrence of destructive floods by supplying additional avenues for their escape. The general proposition that if a river cannot carry its own waters within its own banks, outlet channels will supply a remedy against overflow, certainly sounds reasonable and logical at first hearing. It is both plausible and attractive, but unfortunately is true in exceptional cases only. It is not generally true of sedimentary streams flowing through alluvial lands, and it is not true of the Mississippi River.

The character and useful magnitude of such a stream are largely determined by its behavior in times of flood, and there is no more certain way to dwarf its dimensions and destroy its navigation than by depleting it of its flood-waters. Once check its velocity by outlets, by overflow of banks, or by any other means, thus impairing its power to carry its load of solid matter to the sea, and the inevitable result is that a deposit of sediment takes place and the bed of the stream is raised. The consequences are that the sectional area and flood-carrying capacity are both diminished and the flood surface is raised. Surely the last condition of that stream is worse than the first, for it is smaller than before and less able to retain its flood-waters within its own banks. If new outlets are made to meet this contingency, the current is still further checked, and both the bed of the stream and the water surface are raised higher by increased deposits. It is submitted, therefore, that the permanent effect of outlets is to injure the navigation and increase both the frequency and the magnitude of floods.

Major Harrod, of the commission, in his testimony before the Committee on Levees and Improvement of the Mississippi, said:

I can put the case in another shape. We have gauge records at Memphis and at Helena extending back fifty-four years. If that time be divided into two periods of twenty-seven years each, we find in the first period that the records were not regularly kept, that the great floods alone were recorded; but if you take the mean of the six great floods in the first period at Memphis and at Helena, take their averages, and then take the average of the floods, great and small, at the same points in the second period, you will find that the average of all floods, big and little, in that last twenty-seven years, gives a result at Helena about one and a half feet higher than the average of the six great floods in the first period. The same is true at Memphis, though not to so great an extent. It appears, therefore, that the floods over that part of the river front which has never been consistently leveed have risen from year to year. In the lower part of the river I have applied the same process of investigation.

We have at Natchez a gauge record running back to 1802, and it appears from the records that at Vicksburg, at Natchez, and at Baton Rouge, on a part of the river where levees have been built and maintained with tolerable fidelity there has been no such elevation of the flood surface as is found above. The average floods there are not greater than they were formerly, but in the part of the river where

outlet has been unchecked, there we find as a fact (leaving out now the question of cause) that the small floods along the Arkansas and the Missouri front go higher than the great floods of earlier years. I know of no change that has gone on there to account for this, except the abandonment of the levee system and the permission of unlimited outlet. I consider that the process that has been going on there is something of this nature. With the subsidence of each flood there is a tendency to deposit in the river bed. Any deposit in the river bed at that time of the year, or at any other, of course raises the surface. If an outlet can be found on either side by which that water can escape it does so, and the immediate elevation of the surface is very slight; but the condition of affairs previous to that elevation of bed and surface is immediately restored, and it will be just as easy for another flood coming a few months or a year later to add six inches or a foot to the height of the bed of the river, and for the water to be dispersed as in the first instance. But, on the other hand, when the water is held in by levees and the river is self-contained, resistance accumulates under any such process as this. The minute the river attempts to raise its bed progressively it raises the surface; this increases the slope; this increases the velocity; this increases the scouring. But nothing of that sort can happen when you allow the additional height of surface to be dissipated by outlets. From the facts which I have stated I believe that that part of the river has undoubtedly deteriorated and is deteriorating.

Captain Eads, of the commission, in his testimony before the same committee, said:

Now, in order to prove that shoals exist below crevasses, which can only be accounted for by the reduction of velocity, I will state the fact that at the Jump (an outlet which was made some forty years ago, and which was so big as to draw out ships that were being towed up to New Orleans) there is a bar below it on which the United States Light-House Board has had a buoy placed. That bar has been there for a long time. I do not know exactly how long. Some of the ships in being towed up have struck it and gotten aground, and finally the Government officers placed the buoy there. On that great river below New Orleans, where there ought to be a depth of not less than seventy-five or one hundred feet all the way, there is another crevasse called Cubit's Gap, and below this crevasse there is a bar. It is a well-established fact, from the survey of Talcott, made some forty years ago across the head of the passes, that the crevasse known as Cubit's Gap has caused a diminution of the depth of the water to the extent of one-fourth. The river is very wide there, about one and three-fourth miles, and there was a great width of it during Talcott's survey on which there was no depth less than forty feet. Now there is none of it over thirty feet on the same line.

I might mention other crevasses below which these bars exist. They are in strict accordance with the principles on which the improvement of the mouth of the Mississippi was made. They are in strict accordance with the principles on which the Mississippi River commission has based its advice for the improvement of the whole river; and they are in strict accordance with common sense, which I contend is the foundation of engineering. There is not a problem in engineering (I do not care what branch of it you take, even the problems of the arch, which are supposed to involve the most occult elements in the science of engineering) which cannot be explained to a man of common sense if he understands arithmetic. And it is so with this problem. I do not believe that you can find an engineer of any standing or ability in this country, or in Europe, who has the temerity to deny the truth of the principles on which the commission bases its recommendations.

He also says as follows in a recent minority report:

Observations made by the commission plainly show that the effect of the present gaps in the levees has been to raise the flood line of the river many inches above any heights previously attained within the 700 miles in which they exist most numerous, between Natchez and the mouth of the Ohio River. Within this distance there have occurred during the last eighteen years innumerable crevasses, aggregating in 1875 a length of about 100 miles, and throughout this part of the river the deposits have raised its bed so much as to greatly injure navigation, and to cause smaller floods to rise to heights never before attained.

Such testimony as this, by such distinguished experts, should be sufficient to satisfy the minds of any reasonable men; but as we have cumulative evidence from other sources at hand we will cite it.

OPINIONS OF OTHER EXPERTS.

In the report of the levee commission of engineers, submitted to the governor of Louisiana in 1876, they say, in speaking of the Morganza crevasse which occurred in 1874:

Soundings taken below and above it show a difference of ten feet less depth, and a diminished area of section below than above this crevasse.

Mr. Bayley, of the commission of Louisiana State engineers, made a careful survey of the river above and below Bonnet Carré crevasse in 1874, and says in his report:

As regards the effect of a great outlet, such as the Bonnet Carré crevasse of 1874, observations and measurements show that they cause a partial filling up and contraction of the river channel below them. This certainly was the result at Bonnet Carré in 1874, and it is presumable that it always happens.

Mr. Wrotnowski, an accomplished engineer and formerly assistant engineer of the State of Louisiana, says in a letter to me:

The present Bonnet Carré crevasse broke and began to discharge on April 16, 1874. The fourth flood is now passing through it. Each flood has carried and deposited an amount of sediment behind or near the swamp, filling it up more and more as each flood passes, accumulating also a tremendous quantity of drift-wood in heaps, forming a dam as it were, obstructing the free flow of water and causing at once a deposition of sediment behind these drifts.

This contraction of the crevasse has caused a corresponding deepening of the channel of the river below, as shown by a comparison of the soundings made by Bayley in 1874 and those of the Coast Survey of 1876.

Humphreys and Abbot say that the bar below the above-mentioned Bonnet Carré crevasse of 1850 was composed of hard blue clay, and that "to this natural ridge might, with some plausibility, be ascribed the cause of the crevasse, especially as a second break occurred at the same place in 1859." But later investigations show this opinion was erroneous, for in 1874 another crevasse occurred a little below that of 1850, which resulted in washing away the so-called "natural ridge" and the formation of a new bar below the new crevasse. The soundings by the United States Coast Survey in 1876 clearly illustrate this point. They show a depth of 75 feet near the upper edge of crevasse of 1850, a depth of 72 feet near its lower edge, a depth of 66 feet at upper edge of crevasse of 1874, and a depth of 67 feet at its lower edge,

and below this point 60, 51, and 61 feet, and then, after passing the bar, a rapid increase of depth.

General Gillmore, in his testimony before the Committee on Commerce, quoted as follows from the distinguished General Barnard, of the Army engineers, in regard to the Mississippi in 1859:

Any check in the velocity of the stream, however small, will produce deposition. This is not mere theory; all experience of every observer of the river will confirm it, while it is in itself conformable to reason and common sense that such a check in the velocity of the stream below the outlet is the inevitable result of that outlet.

The Louisiana board of levee engineers, in their report in 1876 to the governor of the State, said:

In many instances—all that the writer knows of—as at the Morganza this year, and below the great Bell crevasse of 1858, the same "contraction of channel" below the outlet was found, but measurements before the crevasses occurred were wanting. Opposite and below Cubit's Gap we have them.

Reference is here made to the Coast Survey maps of the Mississippi River mouth and above them of 1839, (see Talcott's survey,) and the late surveys by Lieutenant Marinden, of the Coast Survey department, in 1875. These show an unmistakable filling up of the river bed below the Cubit's Gap crevasse outlet of 1862. It cannot be said that a "natural contraction of channel," because of an abrupt bend, exists there, for the river is very wide and straight. Where the depths were thirty, forty-two, forty-one, thirty-seven, and twenty-eight feet on a line across the river, with a width exceeding one and a quarter miles about one mile above the head of the passes and below Cubit's Gap, but from thirty to thirty-one and a half feet is found in the deepest middle portion of the river now, and corresponding reduced depths toward each shore-line, the river width remaining unchanged.

OPINIONS OF STEAMBOAT CAPTAINS.

But there is a class of critics who are never satisfied with anything scientific. They condemn skilled engineers as mere theorists, and say, "Give us the common-sense testimony of some plain old steamboat captain who has spent a life-time upon the Mississippi, and is familiar with its characteristics." They lay more stress upon the statements of Captain Cowdon, (a former steamboat captain upon the river,) in support of his outlet plan, than upon the opinions of each and all of the Mississippi River commission, composed of such eminent, experienced, and successful engineers as General Gilmore, Captain Eads, Professor Mitchell, General Comstock, General Suter, and Major Harrod. Now, for the exclusive benefit of these critics, I will cite the testimony of another Mississippi River steamboat captain, of wide experience and observation. Captain Thomas P. Leathers, well known throughout the lower valley of the Mississippi, says in a letter to me:

I am convinced from my observations that if the levees were rebuilt and kept up on the lowlands, the concentration of volume, and consequent accelerated current, would soon wash out a channel large and deep enough for any purposes of commercial navigation. I am thoroughly satisfied that in the last ten years the frequent breaks in the levees and crevasses, dispersing the water over the country and diminishing the current, have caused the river to begin to shoal again. It always shoals near these breaks, evidently in consequence of the slackened current and natural deposit of sediment on the bottom which follows.

Captain Aiken, former president of the New Orleans and Red River Transportation Company, wrote to me to the same effect, as follows:

From Robinson's to Shreveport, distance about 90 miles, there are outlets on either side; the levees are not continuous and connected as they were below; the lands still overflow, and the river is gradually shoaling. Below Alexandria the river is in about the same condition as when first navigated by steamboats, namely, no perfect system of levees, no lowering of its bed; open outlets and annual overflows.

Red River runs its entire course below Shreveport through alluvial soil, similar in all respects to that of the Mississippi. There can be no disputing the facts as to the Red River levees having lowered the river-bed and deepened the channel, as above described. There are thousands of people living on its banks to testify to the truth of this statement, and as the Mississippi and Red Rivers are similar in all respects, except as to the volume of their waters, it seems reasonable to expect that a perfect system of levees on the Mississippi would deepen that river and improve its navigation. In fact, it is known to old Mississippi steamboatmen that the permanent depth of water on the shoalest bars had been increased by several feet along the sections of that river that had been leveed, and that since the breaking of the levees this deepening process has ceased. It is also known to them that bars form opposite and the river shoals below any permanent break or crevasse in a levee.

THE IMPRACTICABILITY OF OUTLETS.

Having shown by three classes of evidence the injurious effect of so-called outlets, I now assert they are impracticable; that the topography of the delta above the mouth of Red River renders it impossible to make a lateral outlet from the Mississippi through any well-defined channel to the Gulf. Take, for instance, the east side of the river between Memphis and Vicksburg, known as the Yazoo Valley, and we will see that any crevasse in the levees or opening of any waste-weir will simply flood the valley, as it did during the existence of the crevasses of Hushpuckany, Bolivar, and other levees of this year, and, after overflowing, returns again to the Mississippi River through the mouth of the Yazoo, causing as it did an extraordinary rise at Vicksburg and below.

Take any point on the west side of the Mississippi above the Saint Francis or the Arkansas Rivers, and all admit that if breaks in the levees or waste-weirs occur there, the water would again return to the Mississippi through the mouths of these rivers, and in case of crevasses in the levees or waste-weirs on the west side of the river below the Arkansas and above the mouth of Red River the waters would again return to the Mississippi through Red River, except what escapes through the Atchafalaya.

The Atchafalaya itself flows in a well-defined channel for over forty miles until it reaches the low basin between the Teche and the Mississippi River, and there it loses its identity and disperses into a

number of channels and lakes, shoals, and swamps, until finally its floods are again concentrated into Grand Lake as a reservoir, and finally in Berwick's Bay, where it concentrates into a deep, well-defined channel, resumes the name of the Atchafalaya, and empties into the Gulf.

It will thus be seen that it is impossible to take the waters laterally from the Mississippi through any well-defined channel above the mouth of Red River, on the west and the mouth of the Yazoo on the east; and owing to the highlands on the east no outlet is possible above the city of Baton Rouge.

Outlets are equally impracticable below the mouths of the Yazoo, Baton Rouge, and Red River, for the reason that a well-defined channel to the Gulf is impossible. The outlet which has been the most strenuously urged upon our attention, the Lake Borgne, is just as impracticable as all the others. General Gillmore, the president of the commission, in his recent testimony before the Committee on Commerce thus shows its fallacy:

Much has been said of late years about an outlet at Lake Borgne, which, at a trifling cost, is expected by its advocates to prevent all overflows in future for hundreds of miles along the lower river. The project of an outlet at this point has engaged the attention of engineers for more than thirty years. It was rejected by Humphreys and Abbot as impracticable; it was also rejected by the levee commission of 1875, which further declared that no assistance in reclaiming the alluvial region from overflow can be judiciously anticipated from artificial outlets, and it was unanimously rejected by the Mississippi River commission in 1880.

It must be remembered that the fall from the Mississippi River to Lake Borgne, in times of flood, is 13 feet in a distance of 5½ miles; that more than 11 feet of this fall is gained in the first mile, and most of this 11 feet in the first 1,000 yards; and that the outlet channel would be in soil that would be easily and rapidly cut away by the current. There would, therefore, ensue a violent rush of water and a rapid enlargement of the channel when first made. The head of the outlet at the river would probably soon pass entirely beyond control, while the lake itself would be filled up by the materials eroded from the cut and by drift-wood drawn in from the river, so that the maintenance of a free passage to the sea for the abstracted waters would be a source of constant and by no means inconsiderable expense. If let alone, therefore, the evil would, perhaps, in process of time, cure itself. Assuming the cut to be kept open, however, with a view of effectively serving its purpose as an outlet, I can confidently reaffirm my belief that its tendencies would be most disastrous; that it would seriously impair the navigation of the river below as far down as the South Pass and the new channel at the jetties, while above the site of the outlet the flood surface would be raised and the dangers from overflow increased.

There is another reason why so-called outlets or crevasses are of no value in permanently lowering the flood-level. There are at the present time five outlets, not including the La Fourche, all of which have occurred within the last forty years, to wit, the Jump, which occurred in 1842, with a width in 1874 of 560 feet, a depth of 55 feet, and a discharge of 11,875 cubic feet per second; Cubit's Gap, which occurred during the late war, the dimensions of which were one channel 900 feet wide, with a maximum depth on one of the sections of 100 feet and 50 feet on the other, and another channel 1,420 feet wide, with maximum depths on two sections (200 feet apart) of 126 feet and 108 feet, respectively. The extreme low-water discharge in one channel alone was found to be 33,000 cubic feet per second.

Next the Bonnet Carré crevasse, the total length of which break was 1,370 feet and the area of discharge 35,000 square feet. Then the Morganza crevasse, with a discharge in 1874 of 6,000 cubic feet per second. Thus showing in 1874, the date at which these surveys were made, an enormous total discharge from the five crevasses.

Add to this the capacity of discharge through the Atchafalaya, which is not less than 200,000 cubic feet per second, and we have a total discharge equal to at least one-fourth of that of the Mississippi itself. And yet the floods below the mouth of Red River are greater than they ever were before. This ought to satisfy the advocates of the Lake Borgne and other outlets that they are of no avail in permanently relieving the Lower Mississippi Valley from overflow.

It has been asserted by the commission that the increased capacity of discharge through the Atchafalaya has practically diverted the Red River, one of the principal tributaries of the Mississippi, and one-sixth of the Mississippi itself in addition. The advocates of outlets might suppose that this would have lowered the flood-levels below the mouth of Red River, but so far from this being the fact it is just the reverse. It should be remembered that fifty years ago the Red River ceased to be a tributary of the Mississippi and the Atchafalaya, situated about three miles below the mouth of Red River, was, at that time, effectually closed by the accumulation of drift which had been collecting and choking its channel for a distance of over twenty miles. At that time there were no levees above the mouth of Red River, and the annual overflows of the banks of the Mississippi River below the mouth of the Arkansas emptied into Black River, thence into the Red, and back again into the Mississippi.

In 1831 the river made a cut-off below the mouth of Red River, and since that time Red River has been emptying into an estuary called Upper and Lower Old River, (an abandoned channel-bed of the Mississippi,) which had been rapidly filling up with deposit from floods. In the meantime the raft in the Atchafalaya was cleaned out by the State of Louisiana in 1839, and it began immediately to scour out, thereby deepening its channel and widening its bed by the constant and rapid caving of its banks until, as stated by the commission, it has diverted the Red River. In the meantime Lower Old River has been gradually filling up, and within the last five years low-water navigation has been entirely closed unless kept open by dredging. This state of affairs has resulted in two plans for its

rectification, one stated in the preliminary report of the commission, and the other in the last report of the commission.

The report of November 25, 1881, proposes to lay a brush sill across Old River between Turnbull's Island and the Mississippi at such points as surveys show to be advisable. This is evidently with a view, as the commission state, of completing the divorce between the Mississippi on the one hand and the Red and the Atchafalaya Rivers on the other. This last report, however, is not unanimous, as one of the commission, Captain Eads, has written an elaborate minority report, in which he states there is no need of further study upon the question of such a divorce, but on the contrary there is every reason for immediate action to restore to the Mississippi the discharge of Red River, which is now going down the Atchafalaya. I agree with Captain Eads in his views on this subject, but am not in favor of closing the navigation of the Atchafalaya. On the contrary, I am for keeping open the navigation of both the Atchafalaya and the Red by restoring the navigation of Red River, and keeping open the head of the Atchafalaya.

It is not for me to urge my own views against those of the commission. If they see proper to complete the divorce of Red River and adopt the plan recommended formerly by Major Benyaurd, by turning it down the Atchafalaya and opening up navigation through Bayou Palquimine, I am inclined to think from their own statements that, so far from relieving the flood-levels of the river below, it would only increase the floods and create the necessity of raising the grade of the levees below. It would also endanger the overflow of the Atchafalaya and its basin to a far greater extent, in my opinion, than was ever known before, because there would be no escape for the floods of Red River and the crevasse water from breaks in the levees above, which now have means of escape through Lower Old River when the extent of the floods is so great as to exceed the capacity of discharge through the Atchafalaya.

The high water of 1828 was the highest ever known below the mouth of Red River. At that time there was a levee system complete on the east to Baton Rouge and on the west very near up to the mouth of Red River. There were no levees above, and the Atchafalaya was practically closed, and the Red River poured its whole volume into the Mississippi. Yet after all the outlets were opened and the discharge through the Atchafalaya had increased, as before stated, the water-gauge at Baton Rouge in 1874 indicated higher water by 18 inches than in 1828. The State engineers of Louisiana, in their recent report to the Legislature, have declared that the water was 18 inches higher this year (1882) below the mouth of Red River at the landing than in 1874.

In conclusion, I may add that the States subject to overflow and chiefly interested in adopting wise measures of relief have never once resorted to the outlet plan, but have ignored it as one of folly and danger.

These significant facts and figures are sufficient I think to convince any reasonable mind that outlets are no permanent relief from the floods of the Mississippi, and that the plan of the commission should have our full and hearty support.

Accounts between the United States and Michigan.

SPEECH

OF

HON. JAY A. HUBBELL,

OF MICHIGAN.

IN THE HOUSE OF REPRESENTATIVES,

Friday, July 7, 1882,

On the bill (H. R. No. 2963) to settle certain accounts between the United States and the State of Michigan.

Mr. HUBBELL said:

Mr. SPEAKER: On the 16th day of January last I had the honor to introduce and have referred to the Committee on Public Lands the bill which I now hold in my hand, a measure in which not only the great State which I have the honor in part to represent on this floor but also the Federal Government has a deep and permanent interest. It is as follows:

A bill to settle certain accounts between the United States and the State of Michigan.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Commissioner of the General Land Office be, and he is hereby, authorized and directed to state an account between the United States and the State of Michigan for the purpose of ascertaining what sum or sums of money are due to said State heretofore unsettled under the fifth proposition of the act of Congress approved June 23, A. D. 1836, for the admission of Michigan into the Union, and that he be required to include in said account all lands located with military bounty-land warrants or land scrip issued for military services in the wars of the United States within the limits of said State, and allow and pay to the said State 5 per cent. thereon as in case of other sales, estimating the said lands at \$1.25 per acre.

Supported as this bill is, by plain and obvious reasons, I had not deemed it necessary, nor do I now propose, to accompany it with any extended remarks. But, inasmuch as it involves the payment of a sum of money out of the national Treasury as well as the performance, in my judgment, of a manifest duty on the part of Congress, I beg leave, at the risk of trying the patience of the House, to offer a few words in explanation and to state as concisely as possible the considerations upon which it ought, as I believe, to obtain the attention of Congress by receiving its solemn sanction and enactment.

The bill provides for the adjustment and payment of a claim made by the State of Michigan and other States against the United States for 5 per cent. upon the valuation of the lands within her limits disposed of for military services in the wars of the United States, estimated at \$1.25 per acre.

The claim is founded upon a compact made between the United States and the State about forty years ago, when as a Territory she applied to Congress for admission into the Union. And although the claim cannot be said in strictness to grow out of the public lands, yet as its extent is determined solely on that basis, and as it is in other respects so intimately connected with that subject, that I may be pardoned for glancing at the public lands of the Northwest and mentioning in brief review some of the considerations out of which the compact arose.

The Territory of Michigan then, as now, embraced the region between the waters of Lakes Huron and Michigan, together with that lying south of Lake Superior, and contained an area of 56,243 square miles—35,995,920 acres.

This was a part of the great body of "waste and unappropriated land" which formed a subject of the most profound importance in the early councils of the nation, and which the original States, for the purpose of cementing more closely the bonds of confederation and perpetual union between themselves, had placed under charge of the Federal Government, not for their own benefit alone, but likewise for the use and benefit of the new States which should in the course of time spring from this vast domain.

Situated northwest of the river Ohio, originally subdued by the arms of Virginia and under her jurisdiction, the Territory of Michigan was a portion of the magnificent cession of that State, over the future destiny of which Congress assumed control under the ordinance of 1787.

By the terms of that instrument Congress solemnly covenanted to extend over all the ceded country the fundamental principles of civil and religious liberty, to establish just, equal, and wholesome laws within it, and from it to carve out and build up sovereign, free, and independent States. And in order to accomplish this Congress, actuated by the most powerful incentives to national conduct—protection and revenue—conceived a plan no less magnificent than the Territory itself, and adopted a policy of the wisest and most liberal character; and to carry out both plan and policy it devoted no less energy and vigor than that then lately exhibited in the struggle for national independence.

The new States to be erected were not to be serfdoms, provinces, or mere pensioners upon the Government. They were to be free, independent, and self-sustaining. To mark out, therefore, and designate their boundaries, and to give the new States names; to populate them with men able to subdue the forests, industrious and intelligent, to cultivate the soil, educated and enlightened to appreciate the rare boon of self-government, and patriotic to defend and preserve it; to provide facilities and conveniences for initiating and establishing their municipal governments; to develop their agricultural resources and give wings to their commerce; to encourage and disseminate useful knowledge; to scatter broadcast the principles of religion, morality, and virtue, and, above all, to inspire the new States with such affection and attachment for the Federal Union as would indissolubly bind their destinies together, all these were the objects and ends to be had in view, and all were comprehended in the plan.

To build up these States, ready means were found in the public lands, while in the landless and homeless population of the seaboard States and the oppressed and down-trodden toilers of the Old World were found the bone, the sinew, and the arm before which the stubborn woods should bow and the fruitful earth give forth her increase. To the former were offered rich and fertile lands at a price within the reach of all; to the latter were held out not only the same lands upon like terms but also security for life, liberty, and property, and absolute freedom to them and their children forever. The policy adopted was in other respects coequal and commensurate with the plan. Great highways were projected leading from the sea to the depths of the wilderness, and their construction carried forward until the tide of immigration outran both project and progress. With a watchful care were made judicious and prudent distributions and reservations of the salines. And for schools, universities, and seats of government, and for roads and canals were brought into requisition and devoted large bodies of the public lands.

All this was done in pursuance of the solemn covenant of 1787 to build up sovereign, free, and independent States. It was done in the direct interest and for the aggrandizement of the General Government, to advance and promote national power, and to secure the safety, permanency, and perpetuity of the Northwestern domain.

And the new States thus erected, founded upon these broad and liberal principles and animated by the quickening spirit that gave them birth, have responded to the most cherished hopes and anticipations in a growth and prosperity both startling and wonderful.

At the time the application of Michigan was made, three States having public lands within their limits had already been formed from the territory ceded by Virginia, Ohio, Indiana, and Illinois. As these States one after the other knocked for admission into the Union, they were stopped at the threshold and asked to make certain stipulations in regard to the public domain lying within their respective limits. Over these lands the General Government must retain its sovereignty, with power to control and administer them in the same manner as before the erection of the States. But the new States, invested with all the attributes of independent powers, would have the undoubted right, in the absence of anything to the contrary, to interfere with and embarrass the Government in their management in the most serious manner. To harmonize, therefore, the dominion of the two sovereignties upon the same soil, the Federal Government through Congress, and the States by their Legislatures, entered into compacts by which the Federal Government agreed to set over to the States certain quantities of the public lands and to pay to them a certain percentage of the moneys which should arise from the sales of the balance; and the States on their part agreed to forbear such rights as in the legitimate exercise of their independent powers they might otherwise have exerted over them. And so Michigan, like the other States I have named, and under similar circumstances, also entered into a compact with the Government. It is contained in an act of Congress approved June 23, 1836, and is as follows:

An act supplementary to an act entitled "An act to establish the northern boundary line for the State of Ohio and to provide for the admission of the State of Michigan into the Union on certain conditions therein expressed."

SECTION 1. *Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled.* That in lieu of the propositions submitted to the Congress of the United States by an ordinance passed by the convention of delegates at Detroit, assembled for the purpose of making a constitution for the State of Michigan, which are hereby rejected, that the following propositions be, and the same are hereby, offered to the Legislature of the State of Michigan for their acceptance or rejection, which, if accepted under the authority conferred on the said Legislature by the convention which framed the constitution of said State, shall be obligatory upon the United States.

First. That section numbered 16 in every township of the public lands, and where such section has been sold or otherwise disposed of, other lands equivalent thereto and as contiguous as may be, shall be granted to the State for the use of schools.

Second. That the seventy-two sections of land set apart and reserved for the support of a university by an act of Congress approved on the 20th of May, 1826, entitled "An act concerning a seminary of learning in the Territory of Michigan," are hereby granted and conveyed to the State, to be appropriated solely to the use and support of such university in such manner as the Legislature may prescribe: *And provided also,* That nothing herein contained shall be so construed as to impair or affect in any way the rights of any person or persons claiming any of said seventy-two sections of land under contract or grant from said university.

Third. That five entire sections of land be selected and located under the direction of the Legislature, in legal divisions of not less than one-quarter section, from any of the unappropriated lands belonging to the United States, in said State, are hereby granted to the State for the purpose of completing the public buildings of the State or for the erection of public buildings at the seat of government of the said State, as the Legislature may determine or direct.

Fourth. That all salt springs within the State, not exceeding twelve in number, with six sections of land adjoining, or as contiguous as may be to each, shall be granted to said State for its use, the same to be selected by the Legislature thereof on or before the 1st of January, 1840, and the same when so selected shall be used on such terms, conditions, and regulations as the Legislature of said State shall direct: *Provided,* That no salt spring the right whereof is now vested in any individual or which may hereafter be confirmed or adjudged to any individual shall by this section be granted to said State: *And provided also,* That the General Assembly shall never sell or lease the same at any time for a longer period than ten years without the consent of Congress.

Fifth. That 5 per cent. of the net proceeds of the sales of all public lands lying within said State which have been or shall be sold by Congress from and after the 1st day of July, 1836, after deducting all the expenses incident to the same, shall be appropriated for making public roads or canals within said State, as the Legislature may direct: *Provided,* That the five foregoing propositions herein offered are on the conditions that the Legislature of said State, by virtue of the powers conferred upon it by the convention which framed the constitution of said State, shall provide by an ordinance irrevocable without the consent of the United States that the said State shall never interfere with the primary disposal of the soil within the same by the United States, nor with any regulations that Congress may find necessary for securing the title in such soil to the bona fide purchasers thereof; and that no tax shall be imposed on lands the property of the United States; and that in no case shall non-residents be taxed higher than residents; and that the bounty lands granted or hereafter to be granted for military services during the late war shall, while they continue to be held by the patentees or their heirs, remain exempt from any tax laid by order or under the authority of the State, whether State, county, township, or any other purpose, for the term of three years from and after the date of the patents respectively.

The propositions thus tendered by Congress were accepted by the State by an irrevocable ordinance approved July 25, 1836.

No one will dispute the validity of this compact. The parties to it possessed absolute powers. The subject-matter was their own, and within their exclusive jurisdiction, and the instrument itself, of the highest, most dignified, and solemn character, has the force of positive obligation as much as though made between separate and distinct nations. Under its provisions it became the duty of the General Government to make the proposed grants good and to pay the 5 per cent. The duties of the State were twofold in character: first, to carry out and faithfully execute the trusts created, and second, to forbear the exercise of certain indisputable rights of sovereignty.

So far as these grants have been made good by the Government, I have to aver the complete and full performance on the part of the State of Michigan of all her obligations. The 1,087,397 acres granted (without restriction, however) for schools have been faithfully applied to that purpose, and upon this foundation has been reared a system of education that will compare favorably with that of any other State or country. With the 46,080 acres granted for a seminary of learning in 1826 and confirmed by this compact has been built a great university, which is now educating at a mere nominal expense 1,300 young men and women, representing no less than thirty-three different States and Territories of the Union, and the good influences of which have been felt in the four quarters of the globe; and so with the 3,200 acres granted for the erection of public buildings, and the 46,080 acres of salt lands, as well as that portion of the moneys arising from the 5 per cent. on sales of the public lands as have been paid over, all have been applied to the purposes for which they were intended. Nor has the State been less faithful in the forbearance of taxes on the public lands within her limits the property of the United States. Nor has she ever interfered with the primary disposal of the soil, or with any regulations Congress has made for securing title to purchasers. Residents and non-residents have been taxed equally, and upon the lands granted for military services in the war of 1812 taxation has been forborne according to the very letter and intent of the compact; and the Federal Government has received and is to-day receiving all such benefits and advantages from the compact as were anticipated at the time it was made. The importance of these stipulations to the Government will be seen with scarcely a moment's reflection.

1. To have submitted the vacant lands, the property of the General Government, amounting in the new States to hundreds of millions of acres, to taxation in the same manner and with the like effect as those of individuals, would have made them a burden rather than a benefit. Their value would have been absorbed in the enormous amounts of taxes levied upon them; the national Treasury would have been depleted and impoverished; the States would have been clamorous for moneys which the Government would not have been able to pay, and the consequences, as may easily be imagined, would have been disastrous and ruinous to the last degree.

2. To have interfered with the primary disposal of the soil and with the regulations made by Congress to secure title to purchasers would have deprived the Government of the free use of its property and would have practically destroyed its utility and value.

3. Equal taxation of residents and non-residents enabled the Government not only to keep its faith with those citizens of Virginia who owned lands there previous to the date of the cession but also enabled it to place and keep these lands on a market as wide as the world itself.

4. To forbear taxation for three years upon lands granted for military services in the war of 1812 enabled the Government to obey an honorable and commendable sense of justice toward those who had shed their blood in its wars, and to discharge, in some slight degree, the debt which a nation always owes its defenders.

But while the Government has thus reaped these benefits from the compact the State of Michigan has suffered great disadvantages. The presence of a great proprietor holding three-fourths of the entire area of the State exempt from taxation was borne without murmur. But when in the subsequent legislation of Congress acts were passed which materially diminished the value of the very grants made by the compact, reduced the value of the lands which had been purchased and paid for by the pioneer, and exempted from taxation lands not of the soldiers of the war of 1812, or their descendants, but of a horde of speculators, and that, too, for a longer period than that named in the compact, these provisions of that instrument might have been regarded with regret and made the just cause of complaint. The recognition of settlers' claims to lands granted for seminaries cost the university fund the enormous sum of \$30,000, or about 16 per cent. of the entire value of the grant. The act of 1852, making land-warrants granted for military services assignable, fairly deluged the market with warrants. Their location was no longer restricted to the warrantees, the soldiers, and their heirs, as I have no doubt was the intention when the compact was made. They passed from hand to hand on the market. Buyers swarmed everywhere. Their name was legion. And such was the volume of the warrants that the price per acre ran down below the Government figure, and with them was made such an onslaught on the public lands as had not been known since the bloated rag-money times of 1836. The history of these measures, sir, is not smothered in the archives of the Government. Their monuments are visible in large tracts of untouched, uncultivated lands in some of the most populous districts of Michigan to-day. There they stand, enriched by the labor and improvements of the pioneer and his children, whose little farms have from the first been depreciated by their presence, bearing but a trifling share of the common burdens, and contributing not one cent to the general prosperity.

I do not mention these things in way of complaint. I notice them because they affect so directly the objects sought by the compact and lie so plainly within the line of its consideration. The State of Michigan accepts cheerfully and hopefully the results of the past, and all she asks in the future, at least so far as this compact is con-

cerned, is that it shall be kept and performed on your part as it has been on hers.

Having thus briefly considered the public lands of the Northwest and the purposes to which by the deed of cession they were to be applied, and also in a general way the compact entered into between the Government and the State, its provisions and effects, I now proceed to the fifth proposition, which covers the subject-matter of the bill now before the House. By it the Government agrees to pay to the State for public roads and canals 5 per cent. of the net proceeds of the sales of all public lands within her limits.

This agreement has been in part performed. Five per cent. of the net proceeds of all sales which have been made for cash has been regularly paid to the State by the proper executive officer of the Government. Five per cent. has also been paid on lands disposed of on other considerations which I shall allude to further on. But upon 4,296,996 acres and upward lying within the State which the Government has granted for services in its wars, the payment of this 5 per cent. has been and now is withheld, on the ground that these grants were not sales within the meaning of the compact. The question has been before the executive branch of the Government for many years. The State of Iowa, admitted under a similar compact and containing a provision, I believe, in precisely the same words, a large part of whose territory had been located with military warrants, presented her claim for 5 per cent. on these lands to the Interior Department of the Government many years ago. The then Secretary of the Interior rejected the claim, expressing his views upon the question in a communication to the governor of that State, as follows:

DEPARTMENT OF THE INTERIOR,
September 20, 1858.

In reply to your letter of the 7th instant, in relation to the application for an allowance of 5 per cent. claimed to be due the State of Iowa on military land-warrant locations, I have the honor to state that in my opinion the act of 1847, to which you refer, is a bounty-land act, and that no distinction can properly be made between locations made under it and those made under other bounty-land laws. The location of warrants issued under the act of 1847 is not considered as constituting a sale of the public lands as contemplated by the act admitting Iowa into the Union. That act appropriates 5 per cent. of the net proceeds of sales of all public lands for making public roads and canals within the State. There being no net proceeds accruing from locations by military land-warrants, the allowance of 5 per cent. on such locations cannot be regarded as having been appropriated or provided for by law.

J. THOMPSON, Secretary.

Governor R. P. LOWE, Iowa.

And although payment was thus refused, that State has persistently pressed the claim ever since, but without success. The Legislature of Michigan, one of the parties to this compact, some years since instructed the governor of that State to press the payment of this claim before Congress. I had the honor to introduce a bill to authorize its payment at the first session of the Forty-fourth Congress, and the subject having engaged the attention of this Congress I beg that it may receive that careful consideration to which from its importance to the State on the one hand, and from its justice as a claim against the General Government on the other, it seems entitled. I claim that this compact contemplated the payment by the Government to the State of 5 per cent. upon the whole area of the State undisposed of at the time the compact was made. That this was the intention of the parties is sufficiently evinced by the language of the instrument itself, by the circumstances existing at the time it was made, and by the subsequent acts of the parties to it.

I do not wish to arraign the decision of the Secretary of the Interior, holding that these military grants were not sales within the meaning of the compact. I differ with him in opinion, but have not the slightest disposition even to find fault; because I think that whenever the Secretary of the Interior or any other disbursing officer of the Government has any doubt about his authority to pay money out of the public Treasury, he should refuse and leave the question to Congress, where it belongs. The rejection of any claim under such circumstances cannot be too highly commended.

But the grants of land to soldiers were sales within the meaning of the compact. What is a sale? As defined by authority its primary signification is to deliver or cause to pass from one to another. In a legal sense, as well as in its ordinary acceptance, it implies an equivalent received by the person making the delivery. And in the broad and comprehensive sense which, under the rules for the construction of treaties, it must have been used in this compact, it can make but little difference what the form or character of that equivalent was. A transaction whereby a thing is delivered and a consideration therefore is received may in this sense be regarded as a sale, whether such consideration be money or anything else of value. In the case before us the Government makes the grant, the soldier performs the service and accepts the grant as its equivalent. Who can dispute the values moving between them, or not observe in the transaction all the elements of a sale?

It will be perceived that the sense of the term is not here limited or restricted. Had it been intended to confine the payment of this 5 per cent. to any particular class of sales, as sales for cash, for instance, is it not reasonable to suppose that it would have been so expressed? But further on in the instrument the consideration is specifically expressed. The language is "bounty lands granted, or to be hereafter granted, for military services." What can be plainer

than that? Now, if it had been the intention of the Government at the time the compact was made to relieve itself from the payment of the 5 per cent. on lands granted for military services, would it not have so declared? The parties were represented and aided by the best minds of that day, and, indeed, by some of the brightest lights that shine in our diplomatic or legislative history. Can it be for a moment supposed that if such had been their intention they would not have said so; that they would not have inserted a provision in this compact which would have precluded the possibility of this question ever arising? The absence of any such limitation raises the strongest inference that such was not the intention. The high character of the contracting parties, the vast importance of the subject-matter before them, and the dignity of the instrument itself all alike repel the idea that the word "sales" was used in any other than its most unrestricted and comprehensive sense.

Indeed, it is impossible to conceive of the disposal of these lands by Congress in any other manner than upon the receipt of a fair and full equivalent. They "shall be considered a common fund for the use and benefit of such of the United States as have become or shall become members of the confederation or Federal alliance of the said States, Virginia inclusive, according to their usual respective proportions in the general charge and expenditure, and shall be faithfully and *bona fide* disposed of for that purpose, and for no other use or purpose whatsoever," says the deed of cession; "faithfully and *bona fide* disposed of for that purpose and for no other use or purpose whatsoever," reiterates the sacred ordinance of 1787. To have parted with them otherwise, therefore, to have given and frittered them away, or to have wasted them, would have been an act in open and direct violation of both of these instruments.

And again, in 1836, the present land system evolved under the act of 1820, which contemplated the disposition of the public lands in no other manner than by sales, had then been in successful operation for sixteen years. All schemes for modifying it, for doing away with it entirely, and indeed for relieving the General Government of all further care over or concerning the public domain, had been put forward, discussed, and considered, and by the most eminent statesmen of the time held impolitic and impracticable, and in this judgment the country had for many years acquiesced.

It will be borne in mind, sir, that these propositions were tendered by the Government to the State. It is probable that as each was passed in review its value was carefully weighed and considered. The area of the State was known, the amount already disposed of was known, and it is only natural to suppose that upon the difference between these two amounts the value of this particular proposition was determined and with great accuracy. Suppose that the Government, observing the value and importance put upon this proposition by the State, had suggested that it was desirable to exempt 50,000 acres from the payment of this 5 per cent. Would not that have attracted the attention of the State? Or 4,000,000 acres. What effect do you think that would have had? Or suppose the Government had said, All I dispose of for a particular purpose (and the amount may be any number of acres up to the whole) shall be exempt from the payment of this 5 per cent. What value do you imagine the State would have attached to this proposition then? If the Government could under this compact dispose of any number of acres less than the whole why not of the whole? Where is to be the line of demarcation? Who is to declare the limit? Suppose the Federal Government, being indebted to the State of New York in a sum equal to the value of all these lands, had transferred them to her in discharge of the obligation, could the Government have thus avoided the payment of this 5 per cent.? And refusing payment, could Congress be said to have kept faith with Michigan?

Neither is this construction changed or in any sense modified by the term "bounty." It is true that a bounty may be a mere gift or munificence not underlaid with love or affection or gratitude, money or land, or anything else of value, fancied or real. It sometimes includes charities and gratuities. And there seems to be a growing inclination to use the word in that sense, as applied to these grants. But no proposition could be more fallacious or delusive. In endeavoring in this manner to inspire the soldier with a sense of his country's generosity and gratitude, we only deceive ourselves. The soldier knows too well the consideration he paid for all he receives. The rigor of the camp, the wearisome march, and the frightful carnage of the field, are ever present before his mind. Nor need we attempt to make the contract with him analogous to that for common hire. The laborer performs his daily task, reaps and enjoys the reward of his toil in ample security of life and limb, and in daily communion with all that man holds dear on earth.

The soldier, on the other hand, waves his broken and hurried adieus to home and kindred, and goes forth to confront danger and death at the hands of inexorable and relentless foes. There the parallel ends. It ends before it begins. Nor is the soldier less faithful in the performance of his duty, though it requires his presence in the very jaws of destruction. Did Perry upon the lakes, with the gallant sons of the Northwest, or Jackson, with the brave Louisianians at New Orleans, falter in the presence of the enemy's guns? The former proclaimed to his exulting countrymen, "We have met the enemy and they are ours;" the latter put a glorious period to the war. Did the conquering heroes of New York and South Caro-

lina deny their country's service in the deep morasses and under the scorching sun of the tropics? Did the American Army quail beneath the flaming fortresses of Cherubusco and Chapultepec? No! They planted the standard of your victorious arms above the glittering spires and sheening palaces of ancient Mexico. Is not one drop of American blood worth eighty acres of American soil?

The truth is, sir, the value of the soldier's services to his country cannot be measured by money, roods, or acres, or by any other human standard. He may take a pittance of money and land and discharge you from all obligations, but for the rest and greater part he must look to the faithful historian, the orator, the poet, the sculptor, and yet at last defer his final reward to Heaven. Why then do you deny a service that cannot be measured even by your utmost ability to pay? Why regard these grants in the light of naked gifts, mere charities, gratuities or alms? An insult to the soldier and an abuse of the national repute. Why protest that you got nothing for your land when you ought rather to boast yourself that you sold it for so great a price. As we deceive no one else with this notion, sir, let us not now deceive ourselves.

But what is a bounty? Lexicographers define it to be an inducement to enlist in the public service. And the plain rules of law and morality require that the same good faith should be exercised in the performance of an inducement to the making of a contract as of the stipulations of the instrument itself. But it may be profitable, if not interesting, to know in what form these inducements presented themselves, and in what way they became a part of the contract between the Government and the soldier. The late war, referred to in the compact, was, as every one knows, the war of 1812, and in order to keep as closely as possible to the subject, I have selected a section indifferently from one of the several acts granting bounty lands to soldiers passed during the pendency of that war; and it will require no argument to convince any one that it forms a vital part of the contract with those who enlisted after its passage, and is obligatory and binding upon the Government. I read section 4 of the act approved 20th January, 1813:

In order to complete the present military establishment to the full number authorized by law with the greatest possible dispatch, there shall be paid to each effective able-bodied man who shall be duly enlisted in the service of the United States after the 1st day of February next, to serve for the term of five years or during the war, an advance of \$24 on account of his pay in addition to the existing bounty; one-half of such advance to be paid at the enlistment of the recruit and the other half when he shall be mustered and have joined some military corps of the United States for service; and a bounty of one hundred and sixty acres of land, as heretofore established by law.

"Pay?" Pay what? Why, a bounty of one hundred and sixty acres of land. And so it is a part of the contract by the public sanction of Congress, and published as such throughout all the land. It has nothing to do with charities or gratuities. But as to these things, sir, the United States have not been laggard. We have neither trampled on the patience nor courted the despair of the soldier; but keenly alive to the value of his services, with hearts responsive to the silent pleadings of his mangled limbs and shattered form, we have administered to his wants, his comfort, and his happiness in such ways as we have had wisdom to devise and means to accomplish. And thus have we shown our gratitude; but the payments of money and grants of land that have been made to him have proceeded from another and a far different motive. The plain letter of your obligation and your high regard for it have impelled you to pay him money and to grant and sell him land, and these considerations alone. Does any one inquire where the "net proceeds" of these sales are?

Behold them in the Union, preserved with all its inestimable blessings and in the safety and the security and the tranquillity of the Republic! From the earliest times, sir, we have stood with our feet firmly planted on the public domain. In one hand, with an unflinching grasp, we have held the public purse. And so long as in the other, with a grasp no less firm and puissant, we shall desire, either for vindication or defense, to wield the sword, it will not be wise for us to deny the price we pay for renewing its temper or for sharpening its bruised and battered edge. But that this is the true construction not only of the term "sales" but also of the compact itself, we are, fortunately, not left to the rules of the schools, the definitions and distinctions of lawyers, or to the uncertainty of human reason and judgment. For the parties themselves have furnished a key which unlocks whatever mystery may be concealed in this question. It is found in their acts some years after the compact was made, and discloses beyond all manner of doubt that the construction now claimed is the true one.

At the time the compact was made there were in Michigan large bodies of Indian lands. The Indians themselves, though regarded as a weak and dependent people, had from the first been recognized as independent nations, with whom our intercourse had been regulated and differences adjusted only by treaty or by force of arms. And their title to these lands, carefully guarded by the organic law of the Northwest, had ever been distinctly recognized and anxiously watched over by the General Government. The ordinance of 1787 provided that the governor of that Territory should proceed from time to time to lay out into counties and townships only those parts of the country in which the Indian title had been extinguished, and declared that "the utmost good faith shall always be observed to-

ward the Indians. Their lands and property shall never be taken from them without their consent, and in their property, rights, and liberty they shall never be invaded or disturbed, unless in just and lawful wars authorized by Congress."

What the respective rights of the Government and Indians were in these lands under the doctrine of the Supreme Court it is not material here to inquire. It is enough to know that Congress has in this open and solemn manner acknowledged their ownership in the Indians, and that it has uniformly refrained from any attempt to exercise jurisdiction over them until after the Indian title had been extinguished by treaty. Yet upon these lands which the Government, at the time of the making of the compact, did not own, but distinctly recognized as the property of another, Congress, ever solicitous concerning its good faith with the States, directed by an act passed March 3, 1857, that the 5 per cent. should be paid over on these lands the same as on all others, except that the valuation was not to exceed \$1.25 per acre. And under the provisions of this act the account has been stated and the money paid. What could more clearly indicate the intention of the parties? I therefore beg leave to repeat that it was intended by the compact that the State should receive 5 per cent. on the entire area of the territory undisposed of at the time the compact was made at a valuation of not less than \$1.25 per acre.

One word more, sir, and I have done. The forbearance of taxation by the State upon lands granted for military services in the war of 1812 furnishes a most valuable consideration for the payment of this 5 per cent. Had these lands been disposed of in the ordinary manner they would have been liable to taxation by the State the moment they passed into the hands of individuals, and would have contributed largely to her revenues and materially lightened the burdens of her people. But, granted as they were, with immunity from taxation for three years from the date of the patents, which on an average was five years from the date of location, the revenues of the State, which depend chiefly on the land tax, were greatly curtailed and embarrassed. The number of acres granted for services in that war and located in Michigan was, as far as I have been able to ascertain from reliable sources, 2,160,640. The actual number is in excess of this. The average rate of taxation would have been about five cents per acre per annum, in a single year amounting to \$108,032, and in five years to \$540,160, a far greater sum than the State would receive upon the entire 4,296,996 acres disposed of for services in this and all other wars, and embraced within her limits, should the account be stated and the money paid over to her to-day.

But, sir, when we come to consider that Congress after the making of this compact made these warrants assignable, and that the lands they represented passed into the hands of speculators, an unwelcome presence in any new country, who neither improved them themselves nor permitted others to do so, but, holding them exempt from common charges also withheld them from market, that they might be enhanced in value by the money and labor of neighboring settlers, thus retarding the growth and prosperity of the State and augmenting the burdens of her people, instead of becoming the homes of soldiers and their children, who would to a large extent have settled and subdued them, and so increased the wealth and prosperity of the State, we have a most cogent and authoritative reason why this claim should be adjusted and paid.

And, in conclusion, I have to say that from such investigation as I have been able to give to the subject I have not discovered any reason why this claim should not be allowed and paid at once. I have heard it intimated that some of the old States, in consideration of the fact that these lands were disposed of for the high and holy purpose of maintaining the Government—for the common good of all the States, Michigan as well as the rest—might feel aggrieved that that State should still insist upon the payment of this 5 per cent. In reply to this, I take the liberty to say for the State of Michigan, that while she appreciates the exalted character of the settlement, she cannot accord to it a potency sufficient to discharge the obligation of a great constitutional compact, especially where the principle involved underlies the very existence and prosperity of the high contracting parties. And, besides, when it is considered that the State for these ends has borne its proportion in the general expenditure out of the common fund, and that in yielding this 5 per cent. she would contribute to that sum more than any of the other States, the suggestion will hardly have weight or be thought entitled to even equitable consideration.

The State of Michigan never complained that while the original States had the land lying within their present limits she had only so much as would enable her to set out on the highway of empire, and in fact only so much as the General Government deemed necessary to subserve great national purposes; but, on the other hand, she accepts her share in the substantial benefits which she, in common with the Federal Government, reaps from these lands, and rejoices in the destiny for which the master-builders of the Republic designed her.

But the older States should not complain that Michigan insists upon the payment of this claim. In the first place, it compasses only that which they themselves conceived and agreed should be done for the general welfare before the Territory of Michigan was erected or could have had any voice in the matter. In the next place, it was after the lapse of half a century—when the original plan for

building up the Northwestern States had been sanctioned and hal- lowed by time—that, at the instance of Congress, this plain and un- equivocal proposition was embodied in the compact. And, lastly, and especially, should they not complain when many hundreds of thou- sands of acres of wild and pathless forests in Michigan, the prop- erty of the General Government—of all the States—is awaiting the expenditure of the moneys which will arise from the enactment of this measure, only to bring by its enhanced price a largely increased revenue to the public Treasury.

I have always supposed, sir, that a contract between the Govern- ment and the States of this Union, or any one of them, was in every respect as binding and obligatory as between nations or individuals; that if the States should owe the Government a sum of money or the performance of any duty, or if there should be anything due by the Government to the States, the obligatory force of the engagement upon which such right or duty was founded would be promptly recog- nized and respected in a manner becoming great and sovereign powers. And since my attention has been called to this compact and the considerations out of which it sprung, I have not met with anything to change or modify these views. Nor am I now per- suaded either that the compact made with Michigan has lost any part of its character, vitality, or force, or that Congress will with- hold or unnecessarily defer its solemn sanction to a measure which involves not only its own self-interest but also the good faith of the Federal Government touching one of its most ancient covenants.

Admission of Washington.

There is a land of pure delight.—*Dr. Watts.*
Knock, and it shall be opened unto you.—*Bible.*

SPEECH

OF

HON. THOS. H. BRENTS.

OF WASHINGTON.

IN THE HOUSE OF REPRESENTATIVES,

Friday, June 23, 1882,

On the bill for the admission of the Territory of Washington as one of the States of the Union.

Mr. BRENTS said:

Mr. SPEAKER: The first bill introduced by me in the Forty-sixth Congress, and indeed the very first bill I ever introduced into Con- gress, was a bill for the admission of the State of Washington into the Union. The very first bill I introduced into this Congress was also a bill for the admission of the State of Washington into the Union. The former was a bill for the admission of the proposed State under a constitution formed by the people on their own motion and without authority from Congress, some four years ago. Opposi- tion was made to it in the committee to which it was referred on that account, and also on account of certain features of the consti- tution providing for the election of members of the first Legislature under the State government, which, owing to changes that had taken place in the mean time, were supposed to operate unjustly against some sections in the apportionment.

The present bill carefully avoids all objections. Drawn in accord- ance with the memorial of the last Legislature of my Territory, it simply proposes to enable the people of that Territory and of the adja- cent northern part of Idaho to form a constitution, and to provide after that for their admission into the Union in the ordinary way. Nearly four months ago, it was favorably reported by the Commit- tee on Territories, with some amendments which I shall discuss at the proper time, and was referred to the Committee of the Whole House on the state of the Union. Since then it has been impossible to reach it on the Calendar in regular order, and may continue so to the end of this Congress. To induce the House, therefore, to make it a special order and set it down for early consideration is my pres- ent purpose in obtaining the floor.

Mr. Speaker, so little seems to be known of that distant portion of our common country by many members of this House, and indeed by most people of the older States, that I deem it advisable, as pref- atory to what else I may say, to describe in brief terms some of its physical features and diversified natural resources, in order to show its capabilities for that statehood with which I ask to have it clothed. For, in considering the application of a territorial candidate for statehood and admission into the national Union several questions very naturally arise, upon the satisfactory solution of some of which, at least, the decision of the matter must depend. What, we are likely to ask, is the area of the proposed State? What are its soil, climate, and other physical materials? What its commercial ad- vantages; its facilities for the development of its nascent sources of expansion and wealth; its capabilities for human sustenance; its pecuniary and financial condition; its population, both present and

prospective, their intelligence, habits, capability for self-government, attachment to the principles of our Government, &c.?

A full answer to all these questions in this case would require more time than I now have at command—would fill a volume—and would, I doubt not, place the claim of my people beyond the pale of peradventure. I shall endeavor, however, to present a few of the many facts bearing on them, and which I trust may suffice for the accomplishment of my present purpose. Owing to the impossibility of obtaining statistics relating to the northern part of Idaho, I shall be compelled to speak mainly of my own Territory alone; but I do so with the statement that what I say of Washington is equally true, and in like proportion, of the whole. And if I can convince the committee and the House that a portion only has the population, the property, and other requisites to constitute a State in the Union, my argument will be only strengthened, if I can also, when the bill is considered, convince them that the boundaries should include a larger area.

GENERAL PHYSICAL DESCRIPTION OF WASHINGTON TERRITORY.

Washington Territory lies between the parallels 45° 32' and 49° of north latitude and the meridians of 117° and 124° 8' west longitude from Greenwich. It is bounded by British Columbia, Idaho, Oregon, and the Pacific Ocean; averages about 340 miles between its eastern and western and 200 between its northern and southern boundaries, comprising an area of 69,994 square miles, of which 3,114 is water, leaving but 66,880 of land surface, and is therefore the smallest organized Territory now belonging to the United States. Divided by the Cascade range of mountains into two unequal sections, it contains, besides the mountainous regions, covered with a dense growth of finest timber and underlaid with vast fields of richest mineral deposits, about 50,000 square miles of pasture and agricultural lands. About four-sevenths of these are classified as timbered, two-sevenths as bunch-grass prairie, and one-seventh as alluvial bottom lands. Over half of the timbered and nearly all the bottom lands lie in the western section; while the bunch-grass prairie lands are embraced in the eastern part. As reported by the Surveyor-General to the Secretary of the Interior, there are no desert lands, no lands requiring irrigation to produce agricultural crops, in the Territory. All are of unsurpassed fertility.

ITS SCENERY.

For beauty, grandeur, and variety of scenery, it is almost unrivaled. Huge conical mountain peaks here and there rear their lofty domes far above the verdure-clothed range below, into the region of eternal snow; crystal cataracts pour their ceaseless foamy torrents from dizzy heights; limpid streams wander through grassy meadows, ripple through verdant woods, or dash in madness through craggy mountain gorges; clear lakes bordered with perennial green, and a thousand other enchanting sights greet the eyes and charm the senses of the lover of nature's romance.

ITS CLIMATE.

Situated so far north, people living east of the Rocky Mountains naturally suppose we of that far northwestern region have a cold and rigorous climate. Even since this bill was reported a Senator of the United States spoke in most contemptuous terms of "the perpetual snow-banks of Washington Territory." But he did not say, for doubtless he did not know, that those snow-banks only coronate our grand mountain giants which pierce the clouds—great nature's lightning-rods, that ever serve to neutralize the electric currents and give us that pure, healthful, ozonic air enjoyed elsewhere after maddened thunders have consumed the muggy poisons of the atmosphere. Laved by the warm Japan current and its aerial concomitant, the balmy chinook, throughout the year our climate is mild, equable, and wonderfully healthful, as will appear from this—

In the western part of the Territory there are two seasons, the wet and the dry, the former generally lasting from November to March or April, during which time the gently-drizzling rains are quite frequent. The rainfall is greatest along the sea-coast, and increases toward the north. At Cape Flattery, the northwest extremity, one hundred and thirty inches has sometimes fallen in a single year, while further inland the annual rainfall is about fifty or sixty inches.

Although in the latitude of Maine, New Brunswick, Canada, Northern Wisconsin, Minnesota, and Dakota, snow and ice are seldom seen, grass grows green the whole year round, and the flowers bloom in midwinter. The average of the thermometric record is 39° in winter and 64° in summer. A table showing

THE RAINFALL AND TEMPERATURE AT OLYMPIA, THE CAPITAL, situated at the head of the Puget Sound, from January 1, 1880, to April 30, 1882, will be here given:

*Broken.

The eastern section is much drier and subject to somewhat greater thermal extremes. The average annual rainfall there, so distributed over every part of the year as to supply all the needs of agriculture, varies in different localities from fifteen to thirty inches. The mean winter temperature is about 34°, and the mean summer temperature about 73°, except along the northern boundary, where it is from 5° to 10° lower both in winter and summer. I present a table showing the amount of rainfall and the temperature in three different localities, where signal stations have been recently established, during the year ending April 30, 1882.

ITS SOIL AND AGRICULTURAL PRODUCTIONS.

Under these favorable climatic conditions the capabilities of this vast fertile region for the production of life-sustaining and wealth-creating material can scarcely be estimated. Most prolific crops of all kinds of cereals, fruits, and vegetables found in the temperate zone are grown without failure and with but little labor. Wheat, oats, barley, rye, flax, corn, sorghum, tobacco, hops, timothy, alfalfa, clover and other grasses, apples, peaches, plums, prunes, pears, apricots, nectarines, quinces, cherries, grapes, and all sorts of berries, Irish and sweet potatoes, tomatoes, beets, turnips, parsnips, carrots, cabbages, beans, pease, melons, and other vegetables, all yield in great abundance and with unfailing certainty. Indeed, these crops are simply prodigious. Of wheat, the great staple and king of com-

merce, over 100 bushels to the acre at a single crop have been produced, 50 bushels is quite common, and the average one year with another is about 30. Oats and barley usually produce from 50 to 75.

The entire hop crop of 1879 was 703,277 pounds, and was only exceeded by that of three States in the Union—New York, Wisconsin, and California—but was unequaled in yield per acre. The product for the two years since then has been much larger.

The flax crop is also very large and fine, both in quality of fiber and seed and in quantity produced. Of this, however, I am unable to obtain any official data. The yield per acre is probably the best in the country, if not in the world. And so of sugar-beets, the yield per acre of which would, if it could be accurately stated, appear simply fabulous. Preparations are now being made for the construction of one or two extensive beet sugaries.

The lightest yield for many years of grain, hops, and vegetables, and especially in the eastern part of the Territory, was that of 1879, while in most of the States, as will be remembered, crops were exceedingly good. Based on that crop, which was considerably below the ordinary yield, I have compiled this table, showing the average yield per acre of cereals and hops in the United States, the several States, Dakota, and Washington, and of Irish potatoes in those States where they are most successfully grown, and in Dakota and Washington, which is as follows:

States and Territories.	Wheat.	Oats.	Barley.	Rye.	Buckwheat.	Indian Corn.	Hops.	Irish potatoes.
The United States.....	13	25	22	11	14	28	567	68

The volume of the grain crops for 1880 was probably 50 per cent. and for 1881 100 per cent. greater; and it is estimated that the wheat crop alone of the present year will be not less than 5,000,000 bushels.

When, sir, all these rich agricultural lands that now idly await the plow of the husbandman are farmed to their full capacity, well may we exclaim, "What will the harvest be!" Why, sir, at a very moderate estimate they are capable of producing more wheat and barley, or oats, buckwheat, and rye than are now raised in the whole United States.

ITS TIMBER.

But more than this. Since Bryant sang in *Thanatopsis* of—

— the continuous woods,
Where rolls the Oregon, and hears no sound
Save his own dashings—

this has been known as the great timber reserve of the New Continent. And it has been said in truth that Washington Territory contains the finest body of timber in the world. Indeed, almost the entire western section and the mountainous portions of the eastern, as already hinted, is one vast unbroken forest. Fir, cedar, pine, hemlock, larch, spruce, tamarac, maple, ash, oak, alder, balsam—these

and other indigenous species, attain an unusual development in girth, height, and symmetry. Not infrequently these trees measure 30 to 50 feet around, 100 to 150 to the lowest branch, and 200 to 300 in height, and are as straight and gently tapering as an arrow. Some yield 20,000 to 25,000, many 12,000 to 15,000, and most of them 5,000 to 8,000 feet of superior lumber when sawed. Over 500,000 feet are sometimes obtained from a single acre. It is estimated that this great forest will yield 160,000,000,000 feet.

ITS LUMBERING INDUSTRY.

The cut for 1880, it is thought, was about 250,000,000 feet, and for last year, 300,000,000, supplying to considerable extent the markets of the Pacific coast of North, Central, and South America, the Hawaiian, and other Pacific and South Sea islands, Eastern Asia, and Australia, and to a more limited extent even those of England, France, and Belgium, 174,176,700 having been shipped abroad from Puget Sound alone during the latter year. In its manufacture about twenty mammoth steam saw-mills, with an aggregated daily cutting capacity of over 1,000,000 feet, are constantly engaged. The location of some of these principal mills, their capacities and value, and the number of workmen employed at each are given in this table:

Location of mills, their capacity and value.

Location.	Daily capacity.	Value.	Men employed.
	<i>Feet.</i>		
Port Gamble	200,000	\$200,000	175
Port Blakeley	135,000	125,000	130
Port Madison	100,000	120,000	75
Tacoma	75,000	80,000	100
Port Discovery	70,000	75,000	80
Freeport	40,000	65,000	40
Knappton	150,000	160,000	140
Port Ludlow	125,000	140,000	115
Utsaladdy	80,000	100,000	60
Seabeck	70,000	75,000	75
South Bend	45,000	60,000	45
Oak Point	35,000	45,000	40

Most of these are located, as the names indicate, at the little bays of PUGET SOUND, THE MEDITERRANEAN OF THE PACIFIC.

This great inland sea, whose width in no place exceeds twenty miles, and whose longest arms, Admiralty Inlet and Hood's Canal, reach nearly two hundred miles from the ocean, with its numerous bays, inlets, estuaries, and creeks, ramifying the whole northwestern part of the Territory—the many-fingered hand of ocean reaching for our nation's commerce—has a shore-line of 1,594 miles, a surface of about 2,000 square miles, and is everywhere navigable for the largest ship that rides the briny wave. Admiral Wilkes, describing this gorgeous sheet of water in his report to the Navy Department, well says:

Nothing can exceed the beauty of these waters and their safety. Not a shoal exists in the Straits of Juan de Fuca, Admiralty Inlet, or Hood's Canal that can in any way interrupt their navigation by a seventy-four gun ship. I venture nothing in saying there is no country in the world that possesses waters equal to these. They cover an area of about 2,000 square miles. The shores of all these inlets and bays are remarkably bold, so much so that a ship's side would strike the shore before her keel would touch the ground. The country by which these waters are surrounded is remarkably salubrious, and offers every advantage for the accommodation of a vast commercial and military marine, with convenience for docks and a great many sites for towns and cities, at all times well supplied with water and capable of being well provided with everything by the surrounding country, which is well adapted for agriculture.

The Straits of Juan de Fuca are ninety-five miles in length, and have an average width of eleven miles. At the entrance (eight miles in width) no danger exists, and it may be safely navigated throughout. No part of the world offers finer inland sounds or a greater number of harbors than are found within the Straits of Juan de Fuca, capable of receiving the largest class of vessels, and without a danger in them which is not visible. From the rise and fall of the tides (18 feet) every facility is offered for the erection of works for a great maritime nation. The country also affords as many sites for water-power as any other.

GRAY'S HARBOR AND SHOALWATER BAY.

Nearly one hundred miles southward, and a little over midway down the western coast of the Territory, listening in placid composure to ocean's angry roar, is Gray's Harbor, into which empty the Chehalis and Humtulpus Rivers, and, twenty-five miles beyond, the Shoalwater Bay, also with its tributaries, reaching out into this vast timber region. And then further on and along its southern boundary still "rolls the Oregon," but now hearing other "sounds" than "his own dashings." A traveler through this region, recently writing to a San Francisco paper, says:

The timber resources of Gray's Harbor are enormous. Not only are its shores bordered with extensive forests, but the whole region drained by the rivers putting into it is heavily timbered. All along the Chehalis River and the various streams tributary to it grow most magnificent forests of fir and cedar. A saw-log cut in the Black Hills, three miles west of Olympia, can be floated into Gray's Harbor.

The following statement of the amount and distribution of the foreign shipments of the lumber cut by the principal mill in this locality during the last two years may give a faint conception of the character and extent of this expanding lumbering industry:

To—	1880.		1881.

ITS SHIP-BUILDING.

This timber, and especially the Douglas or yellow fir, is peculiarly adapted to ship construction. Wilson Saunders was directed by the Lloyds, the great ship-builders, to make a test of all the woods in the world, and in his report he says of this timber:

None of the firs approached in strength the Douglas and pitch-pine, it having required two hundred and eighty pounds to break a small bar of their wood no more than an inch and a quarter square. Between the Douglas fir and pitch-pine, whose strength was equal, there is this great difference, that while the latter snapped short under a pressure of two hundred and eighty pounds, the Douglas yielded unwillingly, with a rough and long rend.

A French authority, also referring to the timber of this region, says:

The principal quality of their woods is a flexibility and a tenacity of fiber rarely met with in trees so aged. They may be bent and twisted several times in contrary directions without breaking. The masts and spars are woods rare and exceptional for dimensions and superior qualities—strength, lightness, absence of knots and other grave vices.

At the Bath ship-yard, in Maine, it requires, I am told, 700,000 feet of timber and lumber to build a 1,200-ton vessel costing about \$35,000, while it can be furnished at the ship-yards on Puget Sound for about \$12,000—less than half the amount. The great superiority, abundance, accessibility, cheapness, and proximity of this timber to the navigable waters and the vast iron and coal fields, of which I shall soon speak, presage that here will be the great navy-yard of the future. Already this branch of the lumbering industry is beginning to assume proportions worthy of notice. Quite a number of ships have been and are being constructed, and preparations are made for the construction of many more. Most of the larger saw-mills have ship-yards adjacent. I subjoin for those desiring to be informed—

A statement of the names, character, size, and dates and places of construction of the vessels built in the Territory, as far as ascertained.

Species of vessel.	Name.	Tonnage.	When and where built.

Total, 85—39 steamers, 25 schooners, 10 sloops, 5 barks, 5 barkentines, and 1 ship.

ITS OTHER WOOD MANUFACTURES.

Barrels, boxes, sashes, doors, and most beautiful and excellent furniture of every style and variety are also made on a large scale, both for domestic use and foreign shipment.

All these interests, however, are but in the infancy of their development. The supply of timber, even without the natural reproduction so rapidly going on, at the present rate of consumption will last for centuries to come.

ITS COAL INTERESTS.

Coal mining is also destined in time to become a great and lucrative industry. Large areas west of the Cascade Mountains are underlaid with deposits of bituminous and anthracite coal, the best yet discovered on the Pacific coast. Indeed, it is believed that the most of this region is one vast coal-field. Lying adjacent to the Puget Sound, its navigable tributaries, or along the lines of railroad soon to be built, it will not long await the miner's pick. Much of it possesses excellent coking qualities, which render it of peculiar value in the development of other local interests. The mining of this coal, begun some years ago, is steadily expanding. The principal mines now in operation are the Newcastle, the Carbon Hill, the Seateco, the Renton, and the Talbot. The Newcastle is the largest, and employs about five hundred men in mining and delivering at Seattle. Besides what has been required for local use and direct foreign exportation, the shipments from Seattle to San Francisco alone, since the mines were opened, have been as follows:

Year.	Tons.	Year.	Tons.
1871	4,918	1877	112,734
1872	14,830	1878	128,582
1873	13,572	1879	132,263
1874	9,027	1880	138,497
1875	70,157	1881	147,418
1876	104,556		
Grand total			876,264

Of this vast quantity, 797,665 tons was the output of the Newcastle mine alone. It is believed that the shipment of this year will be nearly double that of last. Four large steam-colliers with an aggregate carrying capacity of 8,100 tons, and making at least three trips a month, are exclusively employed in transporting the coal of this mine to San Francisco, besides what is carried by other vessels.

Practical and scientific miners, after careful examination of these mines and the surrounding country, express the opinion that they will yield millions of tons and last for ages.

ITS IRON MINES AND MINING.

closely connected with this, constitute a still younger, but not less important interest. Several rich and extensive deposits of bog, hematite, and magnetic ores of the finest quality have been discovered at Chimacum Valley, in Jefferson County, at a point six miles east of the Newcastle coal-mine in King County, and at other places. That at the former place is superior bog, some two feet in thickness and extending over an area of nearly 1,000 acres. Lying from six inches to but a few feet below the surface, the mining of it is quite inexpensive. When smelted it yields about 60 per cent. of iron of great toughness and pliability. Furnaces for its reduction have been erected at Irondale, on the shore of Puget Sound, near by, and during the last year, being the first of their operations, turned out over 15,000 tons of superior pig. Preparations for more extensive works at this point are progressing. The growing demand for this indispensable article in railway construction in this new country, and, in fact, for almost every purpose, offers great inducements for the rapid expansion of this industry; and it may reasonably be expected that it will soon assume very considerable proportions.

ITS PRECIOUS METALS.

In the production of the precious metals Washington ranks the eleventh in the list of States and Territories according to the last census report. Her product for the year ending May 31, 1880, as returned, was \$136,819. Her gold product alone for that year was \$119,000, placing her one number higher in the list of those producing that metal. The principal mines are the Swauk, Peshastin,

Skagit, Similkameen, and Upper Columbia placers. Recent discoveries of gold have also been reported in the vicinity of Gray's Harbor and at other points. Favorable indications of the existence of other extensive mines are present in many places. Over a million dollars have been taken from these mines, and their further development promises a largely increased and permanent yield.

Deposits of copper, lead, tin, zinc, cinnabar, plumbago, gypsum, kaolin, pottery-clay, mica, marble, granite, limestone, and sandstone also exist in many localities, and in time will be of great utility and value.

ITS FISHERIES

constitute another of the great, growing, and inexhaustible resources of the Territory. All its waters, both fresh and salt, from the babbling mountain brooklet to the mighty river and sea which wash over two thousand miles of its shores, teem with the most delicious fish, many varieties of which are of great commercial value.

THE FAR-FAMED COLUMBIA RIVER SALMON

finds an eager market in every country of the civilized world. For over two hundred miles this grand "river of the West" winds its tortuous course within our limits, and then, turning westward, forms the common boundary between our Territory and Oregon for 300 more. Along its banks, on either side, thirty-five large salmon canneries are now established. During the fishing season of last year about 1,650 boats, including 10 steam-tenders, and 7,500 men were engaged in catching, canning, and packing these fish. Each boat catches an average of 2,000 salmon during the season. Only three medium-sized fish are required to fill a case of four dozen cans. Each case weighs 72 pounds gross. The growth and importance of this industry, since its beginning in 1866, is best shown by the following table, showing the amount and value of its product:

Year.	Cases.	Price.	Value.
1866	4,000	\$16.00	\$64,000
1867	18,000	13.00	234,000
1868	28,000	12.00	336,000
1869	100,000	10.00	1,000,000
1870	150,000	9.00	1,350,000
1871	200,000	9.50	1,900,000
1872	250,000	8.00	2,000,000
1873	250,000	7.00	1,750,000
1874	350,000	6.50	2,275,000
1875	375,000	5.60	2,100,000
1876	450,000	4.50	2,025,000
1877	400,000	5.20	2,080,000
1878	460,000	5.00	2,300,000
1879	480,000	4.60	2,188,000
1880	550,000	4.80	2,640,000
1881	530,000	5.00	2,650,000
Grand total	4,655,000		27,204,000

Salmon fisheries of great importance also exist in the waters of Puget Sound, Shoalwater Bay, Gray's Harbor, and elsewhere. At some of these points several large canneries are in successful operation. Respecting this interest of the Territory a recent writer says:

The fish differing much in quality and value, abound literally in millions. They crowd the seas, bays, estuaries, and the smaller rivers which flow into the ocean at certain seasons of the year, and may be easily caught with gill-nets and with the hook. There is ample opportunity still for the healthy growth of the salmon fishing industry in the northwest region.

Codfish, averaging thirty inches in length and eighteen in girth around the shoulders, are also caught in Puget Sound, and almost shoal the waters along the coast for hundreds of miles farther northward. Immense sturgeon, halibut of enormous size and of a tenderness and delicacy far surpassing those of the Atlantic waters, bass, red rock-cod, tom-cod, flounder, herring, smelt, eulachon—a most delicious large sardine—sardines, and several other species of commercial value also abound, while the rivers and the thousands of smaller streams and lakes swarm with salmon, perch, pike, lake trout, salmon trout, and myriads of the renowned speckled mountain trout of the Pacific coast, the most superb of piscatorial dainties, and numerous other freshwater species.

Clams, oysters, lobsters, crabs, shrimp, and, in short, every variety of shell-fish are equally abundant. Oysters are cultivated largely at Shoalwater Bay, Gray's Harbor, and at numerous points on the sound. The finest clams, of every variety—some of them of prodigious size—and in unlimited quantities, are obtained for the picking, wherever the tide ebbs and flows. Large shipments of these shell-fish are made to Oregon, California, and other parts. The proprietors of the beds at Shoalwater Bay have realized over \$100,000 in a single year from the sale of oysters.

Whales, porpoises, sea-otters, and fur-bearing seals are found everywhere along the sea-coast. During the sealing season, lasting nearly half the year, large numbers of the skins are obtained. Six schooners and their crews, and two hundred and thirty-two Makah Indians were engaged in seal-fishing in the vicinity of Cape Flattery in 1880. The number of skins sold to the traders at Neah Bay and reported to Judge James G. Swan, was 6,268, for which \$9 apiece, or \$56,412, were paid. Judge Swan estimates the catch of that year on the coast of the Territory and British Columbia at 20,000, worth at least \$180,000 where caught.

In the words of the careful writer above quoted—

These and other denizens of the waters abound in inexhaustible supply, needing only capital and labor to establish fisheries in this part of the country which would prove as productive and as profitable as any on the face of the globe.

ITS STOCK-RAISING

is another prime interest of the country. For this, I do not hesitate to say that no country in the world possesses better advantages and better adaptation. As I have stated, the climate is mild and the soil productive. Nutritious grasses grow in rich profusion and luxuriance everywhere. Thousands of horses, cattle, and sheep live and fatten on the range the year round, unfed, unsheltered, and almost uncared for. Horses and cattle roam at will; while a single shepherd, with horse and dog, can guard a flock of a thousand sheep. The best imported breeds are generally raised, and each generation seems to surpass its progenitors in point of excellence. Among horses may be found the best draft, carriage, and saddle animals, trotters and roadsters, from the heaviest Clydesdale, or Percheron, to the fleetest thoroughbred; among cattle, the purest short-horns, Holsteins, Jerseys, Alderneys, and Devons; among sheep, the finest Southdowns, Cotswolds, and French and Spanish Merinos. It is estimated that not less than 100,000 head of these animals are annually driven and shipped to eastern markets. The wool-clip for 1880 was, as nearly as I have been able to ascertain, about 3,000,000 pounds, (the spring farm-clip—the ranch-clip, which is quite large, not being ascertainable—was 1,389,123 pounds,) and for last year not far from 4,000,000. One large woolen factory at Dayton, where every class of the very best goods are made, is supplied, and the large surplus is shipped abroad. With the superior facilities which we possess in such abundance, stock-raising, wool-growing, and manufacturing in this and other branches must soon reach gigantic proportions.

Already, sir,

OUR GENERAL MANUFACTURING INDUSTRIES

are far in excess of those of any other Territory and even several of the States. The value of such product for 1879, as shown by the last census report, was \$6,129,762; and according to my best information it has greatly increased during the two years that have since elapsed.

Now, Mr. Speaker, I have briefly mentioned some of our more important resources, and have stated imperfectly the extent of their present development. I might mention several others belonging to the same general class, but deem it unnecessary for my present purpose.

ITS COMMERCE, PRESENT AND PROSPECTIVE.

I will, however, with the kind permission of the House, before passing to other branches of the argument, merely call attention to our favored commercial location, advantages, and prospects. In an incidental way I have stated the extent of our sea-coast and have described our principal harbors and our greatest river. If I had time, I might also describe a number of other navigable rivers of considerable extent, including the Snake, the Cowlitz, the Naselle, the Willapaw, the Chehalis, the Humtulus, the Nooksack, the Stillaguamish, the Skagit, the Snohomish, the Snoqualmie, the Dawamish, the White, the Black, the Puyallup, and navigable lakes, including Union, Washington, and Chelan, which are important factors in our present and future commercial greatness.

The present extent of our commerce cannot be accurately ascertained. That of about three-fourths of the entire Territory—the eastern and southwestern portions—passes through the Oregon custom-houses; no separate account is taken of it, and that modest State takes all credit to herself. The only way I have been able to get even has been to have all the appropriations made for the Columbia and Snake Rivers charged to her account, though they benefit our people more than hers. At least two-thirds of the other fourth is shipped coastwise to San Francisco, and our other modest Pacific neighbor, California, gets the credit for it. Indeed, some of the very best and most important "Oregon" and "California" exports are produced in Washington Territory. Let me present a table showing our

DIRECT FOREIGN TRADE THROUGH THE CUSTOM-HOUSE AT PORT TOWNSEND.

Time.	Entered.		Cleared.		Value of imports.	Value of domestic exports.
	No.	Tonnage.	No.	Tonnage.		
Year ending June 30, 1880....	287	145,067	305	160,353	\$17,515	\$361,449
Year ending June 30, 1881....	306	152,669	322	165,790	22,264	446,795
Ten months ending April 30, 1882.....	303	178,952	315	184,890	44,888	672,069
Total	896	476,688	942	511,033	84,667	1,480,313

This trade, now exceeding that of over two-thirds of the customs districts in the United States, is, it will be noticed, rapidly growing; and what is most significant of our prosperity, the balance—the excess in value of domestic exports over imports—is incomparably in our favor.

An index of the entire commerce of this district and its recent growth will be found in its shipping. The number of vessels documented at Port Townsend, the port of entry of the district, on June 30, 1880, was 105—43 steam and 62 sailing—with an aggregate carry-

ing capacity of 29,029.82 tons; and on June 30, 1881, the number was 117—44 steam and 72 sailing and 1 barge—with an aggregate capacity of 38,018.22 tons, since which time, and prior to March 31 of the present year, the fifteen new vessels built within the district, as before stated, and aggregating a tonnage of 3,097.65 tons, have been documented there, making a documented tonnage of 41,115.87 tons.

But, sir, new and mightier influences are beginning to operate with potential effect in developing our grand commercial possibilities. Railroads, the great auxiliary motors of modern commerce, civilization, and prosperity, are reaching out over our Territory in all directions. Several hundred miles have been built within the last year, and the immediate future promises a more rapid construction. Another year will probably witness the completion of

THE NORTHERN PACIFIC AND OREGON SHORT LINE.

The former, starting from the head of the great lakes, the head of the great system of deep-water inland navigation that bears our commerce half way across the continent, the most wonderful inland commerce the world has ever known, and intersecting the great water-way to the South, passes through the wheat-producing region of the Atlantic Northwest, up and along the banks of a competing free-water navigation—a safeguard against the monopoly of railroad combinations—to the head of navigation near the Great Falls, in Montana, and thence across the Rockies, and down the western slope, through that other great grain-growing region of the Northwest, to its terminus on the shores of Puget Sound. The latter branches off from the Union Pacific at Granger, in Wyoming, goes through Southern Idaho and Eastern Oregon, strikes our southern boundary, and there connects with other lines which pass through the various sections of our Territory and again converge toward the same great terminal point.

Thus two great transcontinental routes will be opened up, placing us in direct communication with, and practically over one thousand miles nearer to, the great centers of American populations and commerce, and giving to the interior of the great Northwest a highway to the ships. The completion of these roads will be a most important event to the nation—an epoch to

THE NORTHWEST.

Of this favored region, its present condition and the glowing prospect of its future, the honorable gentleman from Oregon, [Mr. GEORGE,] in an able and eloquent speech recently delivered in this House, well and forcibly said:

With the near completion of the North Pacific, with direct connection with the Union Pacific, over eight hundred miles, principally of sea voyage, will be saved, and then over two-thirds of the fifty millions of people of these United States will be a hundred miles nearer us than to any other portion of the Pacific coast region, and from five to six hundred miles nearer the rapidly-growing Japan and China trade. Three great means of access we shall have within two years—the Northern Pacific, the Union Pacific, and the Southern Pacific, three great transcontinental competing roads.

Immigration will follow these lines of rail, according to an unvarying rule of both the Old and the New World. The stream of commercial development of the United States, and for that matter the world, is between the thirty-eighth and fifty-fourth parallels of north latitude, the severity of the American Atlantic winter driving it far south in the east, and the mildness of the climate on the Pacific, under the influence of the warm ocean streams, allowing it to go to the northward, as like causes along the European coast have done with the Old World.

The steady tread of man as he advances or emigrates has in all ages been along lines of latitude, rather than longitude. In America the natural channels to carry man and his trade—the rivers—the Ohio, the Missouri, the Mississippi, and their tributaries, run southward. Vast mountain ranges lie along their sides, and it would seem that trade and emigration would flow in that direction. The mutual trade or exchange of the products of the colder with the warmer climates would seem to require it. But man, in his obedience to some other and higher law or circumstance, leaping all obstacles, bridges the rivers, tunnels or scales the mountains, builds roads of steel or iron, or digs canals, and carries himself and his trade east and west, and along these man-made channels has flowed the mighty stream of commerce.

We of the Northwest are along this line, on this belt of latitude, or rather this somewhat isothermal line around the world, along which the tides of commerce and progression, enlightenment, and civilization have ever been rolling. In the United States along this line centers our most dense population, and here we find all of our really great cities. Along this belt are printed all the great newspapers of America and the world, and growth and wealth and prosperity ever attend it. Tracing this belt to Europe, we find it embracing the most enlightened, creative, conquering, and progressive nations, such as England, France, and Germany. It is the great highway of nations from east to west, and along this line "the star of empire" has taken its course. This channel emigration pursues in America with but little deviation, and while toward the southward it could find a more mild climate, richer soil, and more luxuriant growth of delicious fruits and vegetables, emigration hitherto has not gone there, neither has it come from such countries in the Old World. In the last decade nearly 3,000,000 emigrants landed in the United States, and of this number only 50,000, or but one-sixtieth part, came to the Southern ports, and the overwhelming percentage of those arriving at Boston or New York drove irresistibly onward toward the West and Northwest. The great growth of Eastern cities is among the more northerly ones, and increases as you go westward. Boston, Chicago, Cleveland, Toledo, and the more northern towns have excelled Baltimore, Cincinnati, Saint Louis, and the more southerly. Indianapolis has doubled in ten years, and so has Saint Paul, and Minneapolis is four times as large as in 1870. All this seems to be in pursuance of immutable laws of nature and the universe. The aggressive, ever stirring, conquering people are advancing along these lines.

THE CHINA TRADE.

The vast region of the Orient, with its 13,000,000 squares miles and nearly two-thirds of the people of the world, has a commerce that has been sought as a prize of incalculable value, enabling each successive nation that controlled it to sway the world—Persia, Assyria, Carthage, Rome, Venice, Genoa, Spain, Amsterdam, and Britain, each in

its turn. Owing to the ocean currents and their attendant trade-winds, the ships bound from San Francisco to China must sail up the coast at least 500 miles to a point opposite the entrance to Puget Sound before bearing westward across the Pacific. Situated midway between the great centers of European and Asiatic population, where the commerce of the one must meet the commerce of the other, where the transcontinental railways must exchange cargoes with the transoceanic ships, on nature's grand belt-line of trade and travel around the globe, at the bivouac of empire's onward march, the possibilities of our development are mighty.

Immediately eastward from this grand harbor-sea, where the navies of the world may ride in safety, and stretching out to and beyond the summit of the Cascades, lies a region holding in harmonious combination all the local elements for the aggregation of industry, population, and wealth. A recent writer thus tersely describes it:

Not only does the finest quality of fir and cedar timber in vast quantities grow along the streams and rivers flowing westward from the range, but near the summit on the western slope abound great mountains of the purest iron ore to be found in the United States. Only a few hundred rods from this iron mountain is located the marble beds that within five years will be worked, and the marble slabs shipped to all parts of the world. This marble quarry is of far more importance than many people presume. The quarries produce a quality of marble that from its peculiar nature and variegated colors make it superior to anything of the kind found on the Pacific coast. The quantity is said to be inexhaustible, and is comparatively easy of access. Limestone of a superior quality is also found in abundance out in the Snoqualmie region. Last, but by no means the least important, is the more recently discovered deposits of anthracite coal. These coal deposits, however, lie farther to the east, and more nearly upon the summit than do the marble beds and iron mountains. Besides the riches mentioned, nearly every square foot of territory lying on the western slope of the mountains * * * is positively known to overlie vast fields of rich bituminous coal.

Mr. Speaker, at some point on the shores of Puget Sound will grow up a great city; and, sir, I venture the prediction, it will be the future metropolis of the Pacific northwest,

THE TYRE OF THE PACIFIC,

and the commerce of the world will pay it tribute.

I deem it safe to say, sir, that Washington Territory, with its unsurpassed advantages, will support as dense a population as any country in the world. Although the smallest Territory belonging to this nation, with the density of Indiana or Illinois we would have over three and one-half millions of people; of Ohio, over 5,000,000; of New York or Connecticut, over 7,000,000; New Jersey, over 10,000,000; Massachusetts or Germany, over 14,000,000; the British Isles, over 19,000,000; of British India or the Netherlands, nearly 21,000,000; and of Belgium, over 32,000,000, or nearly three-fifths of the present population of the whole United States.

Mr. Speaker, in view of our vast natural capabilities, embodying the elements of greatness, stability, and permanency; in view of our diversified resources, grand and inexhaustible as they are, our present healthy state of development, and the bright, golden promise of our opening future, why should we be denied admission into the family of States? Is it because

ITS PRESENT FINANCIAL ABILITY

to take upon itself the burdens and responsibilities incident to statehood is questioned?

By the assessment of 1878 the amount of our taxable property, estimated at less than one-half its true value, was \$17,865,988; by that of 1879, it was \$21,130,434; by that of 1880, \$23,708,587, and of 1881, \$25,786,415. Full returns for the present year have not yet been made, but as far as they have they indicate a marked increase, in some localities over 100 per cent. Even on the low basis of valuation which our assessors adopt, it is safe to say it will exceed \$30,000,000. Maine and West Virginia, formed by the division of two old and populous States, and Texas, an independent and self-supporting State for many years before its annexation, were the only States ever admitted into the Union with anything like this amount of taxable property. By the last biennial report of the Territorial auditor, made in October of last year, our Territory is shown to be entirely free from indebtedness, with \$22,218 surplus cash in her treasury; and the present rate of Territorial taxation is but two and a half mills on the dollar. How many States in the Union to-day can make as good a showing of their ability to manage their own financial affairs? Illinois is the only one shown by the last national census report to be out of debt; and only two others, Michigan and Nevada, have sinking funds to cover their indebtedness. I present here

A table showing the indebtedness of each of the States.

State.	Total debt.	Sinking fund.	Net debt.
Alabama.....	\$9,071,765		\$9,071,765
Arkansas.....	5,046,405	\$1,006,668	4,039,737
California.....	2,403,000	96,286	3,306,614
Colorado.....	212,814		212,814
Connecticut.....	4,967,600		4,967,600
Delaware.....	880,750		880,750
Florida.....	1,284,980	150,100	1,134,880
Georgia.....	9,951,500		9,951,500
Illinois.....			
Indiana.....	4,998,178		4,998,178
Iowa.....	370,435		370,435
Kansas.....	1,181,975	94,275	1,087,700
Kentucky.....	1,858,008	768,152	1,089,856

Table showing the indebtedness of each of the States—Continued.

States.	Total debt.	Sinking fund.	Net debt.
Louisiana.....	23,437,640		23,437,640
Maine.....	5,848,900	1,166,150	4,682,751
Maryland.....	11,277,111	3,640,443	7,636,668
Massachusetts.....	33,034,726	12,875,248	20,159,478

South Carolina.....	6,639,171		6,639,171
Tennessee.....	27,440,431		27,440,431
Texas.....	5,566,928		5,566,928
Vermont.....	4,000		4,000
Virginia and West Virginia.....	44,584,597		44,584,597
Wisconsin.....	2,252,057		2,252,057

Now, Mr. Speaker, from the grudging manner in which appropriations are doled out to the Territories, when one of them so well able and willing to bear the expenses of its local government comes forward to relieve the General Government of that burden one would suppose that the privilege would be accorded it at once and without hesitation.

But, sir, it may be asked whether we have the requisite population to entitle us to admission? This is probably the most important, if not the controlling, question involved, naturally dividing itself into two others:

First. What is that population?

Second. What is the requisite number for admission?

ITS POPULATION.

By the census of 1860 Washington Territory, then embracing the whole of Idaho and that part of Montana lying west of the Rocky Mountains, contained but 11,138 people. In 1870, and after the organization of those two Territories, there were within its present limits 22,195. In 1878, pursuant to acts passed by our Territorial Legislature, a census was taken, delegates elected, a convention held, and a State constitution formed and adopted. At the taking of that census the population had increased to 50,501. Another was taken in June, 1879, showing it to be 57,784. When the national census was taken in June, 1880—now two years ago—it was 75,116, 27,670 of whom were males over twenty-one years of age, making an increase in that one year of 30 per cent. Since then the rate of increase has doubtless been much greater. In fact, on account of our great distance and isolation from the centers of population and the great dangers, difficulties, and expense attending such a journey, only the more enterprising and courageous emigrants have settled there, the drones and tramps having "fallen out by the way," giving us a braver, thriftier, and more independent and intelligent class of settlers. Hence our growth until recently has been comparatively slow, but, sir, it has been steady, continuous, and ever increasing in ratio, as manifested by its vote. In 1870 this was 6,182; in 1872, 7,801; in 1874, 8,494; in 1876, 9,907; in 1878, 12,647, and in 1880, 15,823.

Under the laws of our Territory a poll and road-poll tax of \$6 per capita is levied on all males between twenty-one and fifty years of age, except firemen, paupers, lunatics, and idiots. By the assessment made in June, 1880, when, according to the last census, the population of the Territory was 75,116, the amount of this tax, as reported by the Territorial auditor, was \$73,283.90. By the assessment of June, 1881, taken a year later, it amounted to \$108,971.25, an increase of 47 per cent. in the first year since the census. At this rate of increase for the two years since the census we should now have nearly 160,000 people. Other classes, however, may not have increased quite as rapidly as the class that pays this tax, but no person with correct information on the subject will place the number much below that figure. Over 20,000 emigrants have passed up the Columbia River by ocean steamer since the 1st of last January, over half of whom have settled in our Territory. Every passenger steamer entering the Puget Sound lands two or three hundred, while a constant stream is pouring in from the eastward overland.

But, sir, even if with the greatly increased facilities provided, the tide of immigration has been no stronger for the two years since the census than during the one preceding—and who can believe it has not been much stronger—we now have at least 127,000 people. Why, sir, if this bill were taken up at once and passed, another year would probably elapse before our admission would be accomplished, for before that can take place our governor must issue his proclamation, an election for delegates must be held, returns made, a convention held, and a constitution formed; returns made of that election, and a third election for representatives and State officers held and returns made. By that time we will have by the most moderate calculation over 150,000 people in the Territory

Now, Mr. Speaker, we come to the second branch of the inquiry :

WHAT POPULATION ARE WE REQUIRED TO HAVE

as a prerequisite to admission into the Union? Some gentlemen seem to claim that it should be equal to the basis of Congressional representation.

The present ratio is 131,425. Probably we have that number. The ratio based on the last census, to take effect next March, is 151,906. By that time we will probably have that number. But, sir, suppose we fall short of it, is there any rule, or should there be any rule established denying or postponing our application? No such rule, sir, is recognized by

THE FEDERAL CONSTITUTION.

The power conferred upon Congress to admit new States is expressed in one short, simple clause, without any express restrictions, conditions, or qualifications. It merely declares in section 3 of article 4, "New States may be admitted by the Congress into this Union." That is all. Had the framers intended to establish any such rule, undoubtedly they would have embodied it in express language. Its omission shows, by clear legal intendment, that it met their disapproval; and the settled maxim for the construction of constitutional as well as statutory law, *expressio unius est exclusio alterius*, applies.

Indeed, sir, those far-seeing statesmen contemplated that in the then future there would be States in the Union—though there were none then—whose population would be below the representative ratio; and they expressly provided for that contingency in the second section of the first article, which declares that "the number of Representatives shall not exceed one for every thirty thousand, but each State shall have at least one Representative."

ABSURDITIES OF THE RATIO RULE.

Now, sir, this House, originally consisting of but 65 members, will, under the apportionment recently made, soon be five times as large, consisting of 325 members, although the ratio has been increased to 151,906—over five times the first ratio.

Why, sir, had not the size of this body been enlarged from time to time in the past the basis of representation under the last census would be 759,532. Twelve States in the Union—Connecticut, Delaware, New Hampshire, Rhode Island, Vermont, Maine, Florida, Oregon, West Virginia, Nevada, Nebraska, and Colorado—have not that population; and yet Congress had the constitutional power to fix 65 as the maximum membership of an effective House.

Congress also had the power to leave the basis of representation at 30,000. Had it done so, this House would now consist of 1,267 members, and after the 4th of next March it would be increased to 1,670, and Wyoming remain the only organized Territory with insufficient population to cover the ratio. Under the apportionments that have been made had the rule been applied against the people of previously admitted States, as it is proposed to be applied against the people of the incoming States, Delaware, one of the original thirteen, would have been excluded for the past thirty years, and several other States would, with us, now be under the odious curse of colonial vassalage.

This great growth has occurred in less than a century, and who can doubt that it will go on for centuries to come? In a very short time this House will have reached its maximum size. It cannot be further greatly enlarged. We must then so adjust the representative basis as to keep pace with our swelling population. A rule, therefore, requiring the ratio number of people as a prerequisite must very soon and forever close the door against the admission of any more new States and render nugatory the clause of the Constitution conferring that power on Congress. But, sir, will it be contended that a rule should be adopted for the admission of new States based upon a principle which would make an invidious distinction between equal numbers of our people, equally loyal, moral, intelligent, and prosperous, or justify the expulsion of old States similarly situated? The Supreme Court of the United States, in rendering the famous Dred Scott decision, declares what no statesman will dispute, whatever his opinion on its other features, when it says:

The power to expand the territory of the United States by the admission of new States is plainly given, and in the construction of this power by all the departments of the Government it has been held to authorize the acquisition of territory not fit for admission at the time, but to be admitted as soon as its population and situation would entitle it to admission. It is acquired to become a State, and not to be held as a colony and governed by Congress with absolute authority.

Sir, should a State already in the Union be permitted to remain in the Union and enjoy the rights and exercise the functions pertaining to that relation while the people of a Territory of the United States of suitable size to constitute a State—citizens of the United States, equal in numbers, equal in intelligence, equal in moral character, and equal in their attachment to the Constitution and flag of our common country, equal in their ability to support and conduct a State government; men who were esteemed as good and worthy citizens of the several States in the Union in which they recently resided, and many of whom have imperiled their lives in the defense of that flag, that Constitution, and that country—are denied admission?

Now, sir, Congress has not the constitutional right to expel a State because its population is below the representative ratio; neither has Congress the moral right to refuse to admit a State solely for that reason. Congress may have the physical power, but it cannot afford to be thus inconsistent.

But, sir, it is argued that without the application of such a rule in the admission of new States gross injustice will be done the more populous ones in the Union, since both will enjoy equal representation in the other branch of Congress. Great disparities between the population of the various States in the Union already exist, always have existed, and always will exist; but all are, and always have been, equally represented in that body. Sir, if that be wrong—which I do not admit—then the fault is inherent in our complex system, and can only be cured by a change in the Constitution itself. Under that system States—political communities in their aggregate and corporate capacities; separate political entities, without regard to the number of their inhabitants—not the people as individuals, are represented in that branch.

Sir, if it be wrong on this account to admit a new State before its population reaches the unit of Congressional representation, does that wrong then cease, or does it not continue until the population equals that of the most populous of all the States. In fine, if this principle is once admitted, does it not prove that not only the admission of a new State, but the existence and continuance of any State in the Union with less population than another, is an injustice to that other? If it were wrong, then when the Union was formed Virginia, Pennsylvania, North Carolina, and Massachusetts were wronged by New York. Now she, in turn, is wronged by them and every other State in the Union.

LIBERALITY OF THE GREAT STATES AND STATESMEN.

And yet, sir, no State through its delegates did more in the convention which formed the Constitution to establish that principle of representation than the State of New York.

But she was actuated in that, sir, by a high sense of justice to the smaller States; and though for sixty years she has maintained her place as the most populous State in the Union, while some of those who once stood above her in the list and opposed this principle of representation in the Senate have dropped into comparative insignificance, still she has ever been consistent, has never betrayed a narrow jealousy of the equal influence of her smaller sisters, and has always extended a hearty welcome to the new-born States staggering in weakness up to the door of the Union. One of her greatest statesmen and truest sons—and she has had and still has many that are both great and true—William H. Seward, when representing her on the floor of the Senate, and the distant little State of Oregon was knocking for admission—although that State was a Democratic State and he a life-long opponent of the Democratic party, although its population was but 50,000 while the representative ratio was 93,425, and a proposition was made to postpone the consideration of the measure, said:

Sir, I know how important it is, where it is practicable in the affairs of government as well as in other concerns of human life, to adopt general rules and to have systematized modes and methods for the transaction of affairs. The Constitution of the United States does, in a great many cases, adopt that principle of generalization; that is, of fixing certain rules and measurements, all of which must be conformed to before a great public transaction can be achieved. But it has always struck me that it was a signal mark of wisdom in the framers of the Constitution that, in regard to the admission of new States into the Union, new members of the confederacy, the Constitution avoided everything like form, everything like measurement, everything like particularity, and submitted the transaction always to the uncircumscribed discretion of the Congress of the United States. Congress may admit new States. * * * Now, what earthly difference can it make to the Republic collectively, to these States collectively, or to any one State in the Union whether Oregon is admitted now or admitted next December. * * * Next December will be the beginning of a short session of Congress, and debates upon this or other subjects may prevent the admission of Oregon for another year. * * * It seems to me, therefore, to be trifling with the State of Oregon, trifling with the people of that community, and to be unnecessary and calculated to produce an unfavorable impression on the public mind in regard to the consistency of the policy which we pursue in admitting States into the Union to delay or deny this application. For one, sir, I think that the sooner a Territory emerges from its provincial condition the better; the sooner the people are left to manage their own affairs and are admitted to participation in the responsibilities of this Government the stronger and the more vigorous the States which those people form will be. I trust, therefore, that the question will be taken, and that the State may be admitted without further delay.

And again, on the final question:

It is not a good thing to retain provinces or colonies in dependence on the central government and in an inferior condition a day or an hour beyond the time when they are capable of self-government. The longer the process of pupillage, the greater is the effect which Federal patronage and Federal influence has upon the people of such a community. I believe that the people of Oregon are as well prepared to govern themselves as any people of any new State which can come into the Union. I do not think the matter of numbers is of importance here. The numbers are estimated at 80,000. The present ratio of representation is 93,425. Eighty thousand is a practical compliance, even if that rule should be enforced; but I shall never consent to establish for my own government any arbitrary rule with regard to the population of a State. I can imagine States which I would not admit with a million of people, and I can imagine those which I would admit with 50,000. * * * I shall vote for the bill.

And her other venerable Senator, Preston King, gave true and terse expression to her liberal spirit, ever willing to "live and let live," in this language, used in the same debate:

I am disposed to vote for the admission of Oregon, though I believe her population is not equal to the ratio required for a Representative in Congress.

So the same broad, national patriotism of Virginia, when she was the most populous State in the Union, and Tennessee an applicant for admission, found utterance in the words of her immortal Madison when he said:

The inhabitants of that district of country are at present in a degraded situation. They are deprived of a right essential to freemen—the right of being represented

in Congress. Laws are made without their consent, or by their consent in part only. An exterior power has authority over their laws; an exterior authority appoints their executive, which is not analogous to the other parts of the United States, and not justified by anything but an obvious and imperious necessity. I do not mean by this to censure the regulations of their provisional government, but I think where there is doubt Congress ought to lean toward a decision which shall give equal rights to every part of the American people.

If there be any inaccuracy in admitting them into the Union before they possess the full number of inhabitants it is only a fugitive consideration. The great emigrations which take place to that country will soon correct the error.

Massachusetts, too, when she stood high in the list of great States, gave us her Robert Dane, who penned the immortal ordinance of 1787, the Magna Charta of the embryonic States then growing up in the Northwest, guaranteeing them republican government and early admission into the Union.

Mr. Speaker, I might cite the eloquent utterances, acts, and votes of the great lights of Pennsylvania, Ohio, Illinois, and other of the larger States to the same effect; but these will suffice.

It is not the great States nor the great statesmen of this nation who oppose the incoming of these young commonwealths. They realize

that all the diversified interests of this broad land are united by the bonds of inseparable wedlock, that "all are parts of one great whole," and that these new and rising States are not enemies to be crushed, but the children of the nation "to the manner born."

ADMISSION OF STATES IN THE PAST.

Now, Mr. Speaker, what rule as to population has been followed in the past? What has been the practice of our Government in the admission of new States? What construction has been placed upon this clause by the precedents? Has Congress by its past action in the admission of new States attempted to interpolate into the Constitution a restriction of this kind?

Mr. Speaker, my time will not permit a recital of the history of the admission of the twenty-five new States which have been added to the Union through the action of Congress. But, for the sake of brevity, I have prepared, in tabulated form, and will present an exhibit of some of these more prominent features of the question now under discussion:

State.	Date of admission.	Representative ratio on previous census.	Population by previous census.			Population when admitted.		
			Free.	Slave.	Total.	Free.	Slave.	Total.
Vermont.....	1791	33,000	85,425	85,425	85,425	85,425
Kentucky.....	1792	33,000	61,247	12,430	73,677	61,247	12,430	73,677
Tennessee.....	1796	33,000	32,274	3,417	35,691	*60,000	*7,000	*67,000
Ohio.....	1802	33,000	45,365	45,365	45,365	45,365
Louisiana.....	1812	35,000	41,896	34,660	76,556	41,896	34,660	76,556
Indiana.....	1816	35,000	24,520	24,520	63,897
Mississippi.....	1817	35,000
Alabama.....	1819	35,000	23,264	17,088	40,352	45,441	30,061	75,512
Illinois.....	1818	35,000	12,282	12,282	34,620	34,620
Maine.....	1820	35,000	228,705	228,705	298,269	298,269
Missouri.....	1821	40,000	56,335	10,222	66,557	56,335	10,222	66,557
Arkansas.....	1836	47,700	25,812	4,576	30,388	*33,000	*9,240	52,240
Michigan.....	1837	47,700	31,639	31,639	*65,000	*65,000
Florida.....	1845	70,680	28,760	25,717	54,477	*34,000	*30,000	*64,000
Texas.....	1845	70,680	*105,000	*38,000	*143,000
Iowa.....	1846	70,680	43,112	43,112	78,819	78,819
Wisconsin.....	1848	70,680	30,945	30,945	*180,000	*180,000
California.....	1850	93,423	92,597	92,597	92,597	92,597
Minnesota.....	1858	93,423	6,077	6,077	*120,000	*120,000
Oregon.....	1859	93,423	13,294	13,294	*50,000	*50,000
Kansas.....	1861	127,381	107,206	107,206	107,206	107,206
West Virginia.....	1863	127,381	*350,000
Nevada.....	1864	127,381	6,857	6,857	*40,000	*40,000
Nebraska.....	1867	127,381	28,841	28,841	*100,000	*100,000
Colorado.....	1876	131,425	39,864	39,864	*100,000	*100,000

*Estimated.

Now, sir, the most cursory analysis of this table will evolve some very potent argumentation against the ratio rule, and in favor of the immediate consideration and passage of the bill to which I am trying to address myself. Some of these States were admitted under conditions and circumstances so dissimilar from the one whose claim I am now endeavoring to present, circumstances requiring the application of principles so different from those here involved, as to furnish no criterion whatever. This is peculiarly so in the cases of Maine, Texas, and West Virginia, and in a less forcible sense in those of Vermont and Kentucky. Maine was formed by the division of Massachusetts, and West Virginia by the division of the Old Dominion. Their earlier admission was not necessary to give their people greater rights than they already enjoyed. Vermont was a colony of New York, and Kentucky of Virginia, formed from their territory and admitted immediately after the formation of the Union with the consent of their mother States. Still, the whole population of Vermont was only about two-thirds, and the whole population of Kentucky was less than two-thirds, and the free population of the latter less than one-half our present population. Texas was an organized sovereign State, an independent nation, for years before her annexation. Neither of these five ever constituted public domain of the United States, nor could either have been admitted at an earlier period.

Now, Mr. Speaker, excluding these non-Territorial States, there have been twenty new States, formed from previously acquired territory of the United States, admitted since the formation of the Union. Of these twenty only four had by the preceding national census the population constituting the representative unit of that census. These were Tennessee, whose population by census of 1790 was 35,691—32,274 free and 3,417 slave—while the ratio based on that census, in which five slaves were counted as three free persons, was 33,000; Ohio, with 45,365 by the census of 1800, while the ratio for that census was also 33,000; Louisiana, with 76,556—41,896 free persons and 34,660 slaves—by the census of 1810, while the ratio for that census was 35,000; and Missouri, with 66,557—56,335 free persons and 10,222 slaves—by the census of 1820, while the ratio for that census was 40,000. So that, since the ratio of representation rose above 40,000, no State has been admitted from a Territorial condition with a population at the taking of the previous census equal to the ratio for that census.

Again, sir, it will be observed that at least eight of these new States had not even when admitted the representative unit of population for the last national census taken before such admission. These were Illinois, Florida, California, Oregon, Kansas, Nebraska, Nevada, and Colorado. Illinois was admitted with 34,620 people, about one-fourth of our number, the ratio being 35,000; Florida with about 64,000, about one-half our number, of whom about 30,000 were slaves to be rated as 3 to 5, and so reducing the representative number to about 52,000, the ratio being 70,680; California with 92,597, less than three-fourths our number, while the ratio for the census of 1880 (just taken) was placed at 93,423; Oregon with about 50,000, only having 52,465 over a year afterward, less than two-fifths of our number, the ratio still being 92,597; Kansas, "bleeding Kansas," so much abused and so long delayed, with 107,206—20,000 or more below Washington—while the ratio for that census was raised to 127,381; Nevada and Nebraska, under the same ratio, with but 42,491 and 122,993, respectively, by the census taken long after their admission; and Colorado with about 100,000 after the ratio had risen to 131,425.

The first four were admitted by Democratic and the last four by Republican administrations. So that the practice has the sanction equally of both those parties. But again, sir, both these great parties placed themselves squarely and unequivocally on the record against the application of the ratio principle in

THE OREGON CASE.

to which I have just referred. Oregon, as I have stated, had, when admitted, about 50,000 people, while the ratio of representation was 93,423. Senator Douglas, in charge of the bill for her admission, stated his belief that her population was about 55,000 or 60,000, while Senator Seward and some others thought it was about 80,000. Very few claimed that she had 93,423. And yet, on the passage of the bill through the Senate, the vote stood as follows:

YEAS—ALLEN, BAYARD, BENJAMIN, BIGLER, BRIGHT, BRODERICK, BROWN, Cameron, Chandler, CLINGMAN, Collamer, Dixon, Doak, DOUGLAS, Foot, Foster, GREEN, GWINN, Harlan, HUSTON, JOHNSON OF ARKANSAS, JOHNSON OF TENNESSEE, JONES, King, POLK, PUGH, SEBASTIAN, Seward, SHIELDS, Simmons, SLIDELL, STEWART, TOOMBS, WRIGHT, YULEE—35; 11 Republicans, 24 Democrats.

NAYS—Bell, CLAY, Crittenden, DAVIS, Durkee, Fessenden, FITZPATRICK, Hale, Hamlin, Hammond, HENDERSON, HUNTER, IVERSON, KENNEDY, MARION, Trumbull, Wade—17; 6 Republicans, 8 Democrats, 3 pro-slavery Whigs.

And when the bill came into this House, the question was presented still more sharply—indeed, in the most direct form possible—pure and simple. While the bill was under consideration, Mr. HILL, of Georgia, a member of the national American party, moved to strike out so much as provided for her immediate admission with one Representative, and providing:

That whenever it is ascertained by a census, duly and legally taken, that the population of the Territory of Oregon equals or exceeds the ratio of representation required for a member of the House of Representatives of the United States, Oregon shall be received into the Union on an equal footing with the other States in all respects whatever.

This amendment was rejected by the following overwhelming vote:

YEAS—Abbott, Blair, Boyce, Bryan, Chaffee, Horace F. Clark, Clawson, Dick, Farnsworth, Gilmer, Hill, Keitt, Kellogg, John C. Kunkell, McQueen, Matteson, Maynard, Miles, Millson, Mott, Olm, Ricard, Royce, Scales, Henry M. Shaw, Shortell, Stallworth, Trippe, Underwood, Vance, Walbridge, Zollicoffer—32; 13 DEMOCRATS, 11 REPUBLICANS, 8 AMERICANS and WHIGS.

NAYS—Adrian, Ahl, Andrews, Arnold, Atkins, Avery, Barksdale, Barr, Billingshurst, Bingham, Bonham, Bowie, Branch, Brayton, Buffington, Burlingame, Burnett, Burns, Burroughs, Caruthers, Case, Caskie, Cavanaugh, Chapman, Ezra Clark, John B. Clark, Clay, Cobb, Clark B. Cochrane, John Cochrane, Cockerill, Colfax, Conins, Corning, Cox, James Craig, Burton Craig, Crawford, Curry, Curtis, Davidson, Davis of Maryland, Davis of Indiana, Davis of Massachusetts, Davis of Iowa, Dean, Dewart, Dimmick, Dodd, Dowdell, Durfee, Edie, Edmundson, Elliott, English, Fenton, Florence, Foley, Foster, Gartrell, Gillis, Giltman, Gooch, Goode, Granger, Greenwood, Gregg, Girou, Lawrence W. Hall, Robert B. Hall, Harlan, Harris, Hatch, Hawkins, Hodges, Hopkins, Horton, Houston, Hughes, Huyler, Jackson, Jenkins, Jewett, George W. Jones, Owen Jones, Keim, Kelsey, Kilgore, Knapp, Jacob M. Kunkell, Lamar, Landy, Lawrence, Leach, Leidy, Leiter, Letcher, Lovejoy, MacLay, McKibben, McRae, Humphrey Marshall, Samuel S. Marshall, Aaron Miller, Montgomery, Moore, Morgan, Morrow, Edward Joy Morris, Isaac N. Morris, Oliver A. Morse, Murray, Niblack, Nichols, Palmer, Parker, Pendleton, Pettit, Peyton, John S. Phelps, William W. Phelps, Phillips, Pottier, Fottle, Powell, Purman, Reagan, Reilly, Robbins, Roberts, Ruffin, Russell, Sandidge, Savage, Scott, Seaking, Seward, Aaron Shaw, Judson W. Sherman, Singleton, Robert Smith, Samuel A. Smith, Spinner, Stanton, Stephens, Stephenson, James A. Stewart, William Stewart, Talbot, Tappan, George Taylor, Miles Taylor, Thayer, Thompson, Tompkins, Vallandigham, Wade, Waldron, Walton, Ward, Cadwallader C. Washburn, Elishu B. Washburn, Israel Washburn, Watkins, White, Whiteley, Wilson, Winslow, Wood, Wortendyke, August R. Wright, John B. Wright—173; 106 DEMOCRATS, 61 REPUBLICANS, 6 AMERICANS and WHIGS.

Again, sir, before that, when

FLORIDA

was an applicant, and as I have stated, the ratio was 70,680, the same question arose. The treaty with Spain ceding the Floridas to the United States provided that the inhabitants should "be incorporated in the Union of the United States, as soon as may be consistent with the principles of the Federal Constitution."

The memorial of that State, after quoting that article, which is very similar though not so strong as the third article of the treaty with France ceding the Louisiana Territory, of which Washington is a part, makes this powerful appeal:

It is believed by many that an accurate enumeration would exhibit a population in Florida, estimated according to the basis of representation in the House of Representatives of the United States, fully equal to, if not greater than, the present ratio. But the people of Florida respectfully insist that their right to be admitted into the Federal Union as a State is not dependent upon the fact of their having a population equal to such ratio. Their right to admission, it is conceived, is guaranteed by the express pledge in the sixth article of the treaty above quoted, and if any rule as to the number of population is to govern, it should be that in existence at the time of the cession, which was thirty-five thousand. They submit, however, that any ratio of representation dependent on legislative action based solely on convenience and expediency, shifting and vacillating as the opinion of a majority of Congress may make it, now greater than at a previous apportionment, but which a future Congress may prescribe to be less, cannot be one of the constitutional principles referred to in the treaty, consistency with which, by its terms, is required. It is, in truth, but a mere regulation, not founded on principle. No specific number of population is required by any recognized principle as necessary in the establishment of a free government.

It is in no wise inconsistent with the principles of the Federal Constitution that the population of a State should be less than the ratio of Congressional representation. The very case is provided for by the Constitution. With such deficient population, she would be entitled to one Representative. If any event should cause a decrease of the population of one of the States, even to a number below the minimum ratio of representation prescribed by the Constitution, she would still remain a member of the confederacy and be entitled to such Representative. It is respectfully urged that a rule or principle which would not justify the expulsion of a State with a deficient population, on the ground of inconsistency with the Constitution, should not exclude or prohibit admission.

But wherefore should we be constrained to remain longer under institutions so hostile to the cardinal maxims of free government, so obviously at war with the vital principles of the Federal Constitution, as those of a Territory? Can the denial to us of an equal portion of the blessings of free government benefit any of our fellow citizens of the States? Can it be essential to their well-being and prosperity that we should be compelled to remain still longer in a state of galling and humiliating disfranchisement? Will our admission as a State inflict any injury upon them? The people of Florida call, then, upon their fellow-citizens of the States not to force upon them any longer the odious principle of "taxation without representation," not to contradict in practice the republican axioms that man is capable of self-government, and that all free governments are founded upon and derive their just powers from the consent and will of the people.

Mr. Speaker, this appeal was heeded, and Florida was admitted into the Union. Now, sir, no act of Congress for the admission of a State ever contained a clause making such admission dependent upon her having the ratio number of people, or any stated number of people. True, sir,

THE ACT OF MAY 4, 1858, FOR THE ADMISSION OF KANSAS,

may at first blush appear to be in conflict with this statement. That bill provided that Kansas, in case of her renunciation of her asserted right and intention to tax the property of the United States within her borders, should be then admitted with less than the ratio number; but if she refused she should, as a penalty for that refusal, remain out until she acquired that population. And even that act was superseded by another admitting her before she had the ratio number.

Now, Mr. Speaker, in the face of the significant provision of the Constitution—beautiful in its simplicity—imposing no such harsh and unjust condition precedent; in the hearing of the noble appeals of the great statesmen of the nation, whose eloquence lights up the way before us; in view of that long line of precedents, and of the record of this vote which I have read, can either of these great parties now consent to sink itself to the depth of self-stultification necessary to the espousal of this absurd, unjust, and repudiated rule for the admission of new States?

MOIETY REPRESENTATION.

Are you going to establish a rule that refuses all representation to the new States of the Union, but not in the Union, because you will not let them in for the reason that their population is not equal to the representative ratio, while you not only accord it to those that are in with less than that ratio, but also give to those already represented additional representation for a fraction of that ratio? Why, sir, sixteen States in the Union get under the apportionment recently made each a Representative on this floor for a mere fraction of the ratio number, while those of the Union, but not in it, get no representation; on the principle, I presume, that "To him that hath shall be given; but from him that hath not shall be taken even that which he hath." Those States and the numbers on which they get the representation are as follows:

Nevada.....	62,265	Massachusetts.....	112,046
New York.....	70,912	Florida.....	115,445
Texas.....	73,514	Michigan.....	117,271
South Carolina.....	84,186	Rhode Island.....	124,622
Kansas.....	84,530	Kentucky.....	129,648
Wisconsin.....	100,232	Virginia.....	145,652
California.....	105,156	Delaware.....	146,654
Iowa.....	105,560	Nebraska.....	148,621

THE TRUE RULE—SIXTY THOUSAND FREE INHABITANTS.

Now, Mr. Speaker, as we have seen, the Constitution does not state what number and kind of inhabitants are necessary to entitle one of its Territorial dependencies to admission as a State. But, sir, the contemporaneous public acts and legislation of the States and Congress is quite significant of the views entertained by the fathers on the subject, casting a shade of meaning upon the Constitution itself.

Near the close of the Revolution, as will be remembered, Congress became greatly embarrassed in its conduct of that terrible struggle, owing to sales by some of the States of portions of their western territory, which afterward led to a recommendation by Congress to such States as held such territory to cede it to the United States with an assurance that the same should "be disposed of for the common benefit of the United States and be settled and formed into distinct republican States, which shall become members of the Federal Union, and have the same rights of sovereignty, freedom, and independence as the other States."

Pursuant to this recommendation of Congress, contained in its resolutions of September 6 and October 10, 1780, New York, Virginia, and other States ceded their claims to the Northwest Territory, and while the convention which framed the Constitution was in session the famous ordinance of 1787—the grand bill of rights for that Territory—was passed by the unanimous vote of the Congress of the Confederation. That ordinance contained, among other provisions, the following:

And for extending the fundamental principles of civil and religious liberty, which form the basis whereon these republics, their laws and constitutions are erected; to fix and establish those principles as the basis of all laws, constitutions, and governments which forever hereafter shall be formed in the said Territory; to provide, also, for the establishment of States and permanent government therein, and for their admission to a share in the Federal councils on an equal footing with the original States, AT AS EARLY PERIODS AS MAY BE CONSISTENT WITH THE GENERAL INTEREST:

It is hereby ordained and declared, by the authority aforesaid, That the following articles shall be considered as articles of compact between the original States and the people and States in the said Territory, and forever remain unalterable, unless by common consent, to wit:

ART. 5. There shall be formed in the said Territory not less than three nor more than five States; * * * and whenever any of the said States shall have 60,000 free inhabitants therein, such State shall be admitted by its delegates into the Congress of the United States on an equal footing with the original States, in all respects whatever; and shall be at liberty to form a permanent constitution and State government; * * * and so far as it can be consistent with the general interest of the confederacy, such admission shall be allowed at an earlier period, and when there may be a less number of free inhabitants in the State than 60,000.

Soon afterward the Carolinas followed with cessions of their claims to the territory south of the Ohio, and Congress, by the act of May 26, 1790, extended to the inhabitants thereof "all the privileges, benefits, and advantages set forth in the ordinance" of 1787, save those contained in the sixth article of compact, prohibiting slavery.

And when Georgia next ceded the Mississippi territory the cession was made upon the express condition—

That the territory thus ceded shall form a State, and be admitted as such into the Union, as soon as it shall contain 60,000 free inhabitants, or at any earlier period if Congress shall think it expedient.

This, then, was

THE RULE ESTABLISHED BY THE FATHERS OF THE REPUBLIC,

for all territory which, at the close of the Revolution, fell to the States, and was ceded by them to the General Government, then extending southward to the thirty-first parallel and westward to the Mississippi—all that belonged to the United States prior to the Louisiana purchase. And even after that purchase the same rule was embodied in the organic act of the Orleans territory. It was an absolute, uniform, and unchangeable rule, at entire and irreconcilable variance with the ratio principle, based upon a different number and classification of persons—a number that has never been and never will be the basis of Congressional representation—subject to none of its fluctuations, and a number that includes only “free inhabitants.”

WASHINGTON WITHIN THE RULE.

Now, Mr. Speaker, the first section of the organic act of the original Oregon Territory, passed August 14, 1848, reads as follows:

Be it enacted, &c., That from and after the passage of this act all that part of the territory of the United States which lies west of the summit of the Rocky Mountains, north of the forty-second degree of north latitude, known as the Territory of Oregon, shall be organized into and constitute a temporary government by the name of the Territory of Oregon: *Provided,* That nothing in this act contained shall be construed to inhibit the Government of the United States from dividing said Territory into two or more Territories, in such manner and at such times as Congress shall deem convenient and proper, or from attaching any portion of said Territory to any other State or Territory of the United States.

And then, passing on to section 14 of that act, we read as follows:

SEC. 14. *And be it further enacted,* That the inhabitants of said Territory shall be entitled to enjoy all and singular the rights, privileges and advantages granted and secured to the people of the territory of the United States northwest of the river Ohio, by the articles of compact contained in the ordinance for the government of said Territory, on the 13th day of July, 1787.

THE TENNESSEE CASE.

Now, Mr. Speaker, this language is even more clear and explicit than that employed in the act of May 26, 1790, relative to the territory south of the Ohio. The construction given to the language of that act by those who passed it—those, too, by whom the ordinance itself was enacted, and who framed the Constitution—should be entitled to great weight, if there were any doubt as to its meaning and purport. On receipt of the memorial of the Legislature of Tennessee a special message was transmitted to Congress by the first President of the United States, which reads:

Gentlemen of the Senate and of the House of Representatives:

By an act of Congress passed on the 26th of May, 1790, it was declared that the inhabitants of the territory of the United States south of the river Ohio should enjoy all the privileges, benefits, and advantages set forth in the ordinance of Congress for the government of the territory of the United States northwest of the river Ohio.

Among the privileges, benefits, and advantages thus secured to the inhabitants of the territory south of the river Ohio, appear to be the right of forming a permanent constitution and State government, and of admission as a State by its delegates into the Congress of the United States on an equal footing with the original States in all respects whatever, when it should have therein sixty thousand free inhabitants:

G. WASHINGTON.

UNITED STATES, April 8, 1796.

In the House this venerable message was referred to a select committee of five, who, by Mr. Dearborn, its chairman, reported April 12, 1796, the following resolution:

Resolved, That by the authenticated documents accompanying the message from the President of the United States to this House on the 8th day of the present month, and by the ordinance of Congress bearing date the 13th of July, 1787, and by the law of the United States, passed on the 26th of May, 1790, it appears that the citizens of that part of the United States which has been called the territory of the United States south of the river Ohio, and which is now formed into a State under a republican form of government, by the name of Tennessee, are entitled to all the rights and privileges to which the citizens of other States in the Union are entitled under the Constitution of the United States, and that the State of Tennessee is hereby declared to be one of the sixteen United States of America.

In the debate that followed, participated in as it was by the leading statesmen of that day, there was but one opinion expressed as to the point on which I am now insisting. Let me make some quotations from the record of that discussion:

Mr. W. Lyman said the subject presented itself in two points of view—as it related to the Territory being admitted as a State into the Union, or as giving them a right to send members to Congress. In his opinion, according to the ordinance of Congress, they had a clear right to be admitted as a State into the Union, for it was there said that when they had 60,000 inhabitants they should be entitled. * * * This fact, he said, came fully ascertained, and being so, there could be no doubt the right was clear. It was a right, indeed, which they could not deny, and as a matter of expediency it was not worth while to oppose it.

Mr. Macon said the chief differences in the opinions of gentlemen arose upon a subject which was not before the committee, namely, the number of Representatives to which this new State was entitled in that House. The question before the committee was on admitting the Territory to be a State of the Union. There appeared to him only two things as necessary to be inquired into: First, was the new government republican? It appeared to him to be so. And, secondly, were there 60,000 inhabitants in the Territory? It appeared to him there were; and, if so, their admission as a State should not be considered as a gift, but as a right. * * * To admit this Territory as a member of the Union appeared to him as a matter of course.

XIII—468

Mr. Baldwin said * * * he thought, as to the principle in this case, there could be no doubt whenever the event happened, of their having 60,000 inhabitants, as pointed out by law, their right to be a State took place. It was to depend entirely on that contingency; when that was proved to have taken place they could not be debarred. There having been no mode previously pointed out for ascertaining this fact, only makes it more difficult for the Territory and for Congress to be satisfied of the fact of their actually having so many inhabitants, but does not affect their right. They must be admitted to be a State as a matter of right.

Mr. Madison said: If there were the stipulated number of inhabitants, that Territory could not be denied its claim of becoming a State of the Union without a violation of right; but if the inhabitants requested it and Congress pleased to admit them before they had their full complement, the error could not be of so serious a nature.

Mr. Gallatin was of opinion that the people of the Southwestern Territory became ipso facto a State the moment they amounted to 60,000 free inhabitants, and that it became the duty of Congress, as part of the original compact, to recognize them as such and to admit them into the Union whenever they had satisfactory proof of the fact.

The only question which in his opinion deserved consideration was whether the proof given to them that there were 60,000 inhabitants was satisfactory.

Mr. Coit said that as he had not heard it suggested from any quarter that it would be expedient to divide the Territory into two States, he did not think it important to inquire into the powers of Congress in that respect. It is declared by the ordinance for the government of the Territory that when there should be 60,000 free inhabitants in any one of the States there, they should be admitted into the Union. If, then, it is not in contemplation to divide the Territory into two States, he considered that the right to be admitted was complete as soon as there was the requisite number within the whole Territory.

Mr. Sitgreaves said: Two constructions of this compact had been contended for; one, that as soon as 60,000 free inhabitants should be collected within the Territory, they should be entitled to a place in the Union as an independent State; the other, that Congress should first lay off the Territory into one or more States, according to a just discretion, defining the same by bounds and limits; and that the admission of such States, thus defined, should take place as their population respectively amounted to the number of free inhabitants mentioned; that is, that the 60,000 inhabitants could not claim admission into the Union unless their number was comprised within a State whose territorial limits had been previously ascertained by an act of the United States.

The matter coming up simultaneously in the Senate, the main question in contention was whether the formation of the Territory “into one or more States,” as contemplated by the North Carolina cession, by a separate act, was a prerequisite. At first the Senate, by a slight majority, adopted the report of its committee declaring the affirmative view, in this language:

By the act for the government of the territory of the United States south of the river Ohio, the whole of the said territory, for the purpose of temporary government, is made one district, and it is declared that the inhabitants thereof shall enjoy all the privileges set forth in the ordinance for the government of the territory of the United States northwest of the Ohio. As in the territory northwest of the Ohio it is necessary that the same shall by Congress be laid out into States according to the conditions of the act of cession, or to the provisions expressed in the ordinance of Congress, and that such States shall each contain 60,000 free inhabitants before they are entitled to be admitted into the Union, so in the territory south of the Ohio Congress are obliged by the act of cession of North Carolina to lay out the territory thereby ceded into one or more States, the inhabitants of which, so soon as they shall amount to 60,000 free persons, will be entitled to be admitted into the Union.

Afterward the Senate receded from this position, and passed the bill for admission of the State, without further preliminaries, without even a division. But that question is not involved in the present case.

The original Oregon Territory, to which these “privileges, benefits, and advantages” were extended by the act of 1848, has since been subdivided into the “two or more Territories” contemplated by the first section of that act. The one which retained the original name—

OREGON—

presented itself for admission over twenty-three years ago. In the debate which then occurred in this House this same question was discussed, and resolved, as we have seen, in her favor. The venerable gentleman from Georgia, [Mr. STEPHENS,] who was then a member of this House, presented the argument so much more clearly, forcibly, and eloquently than I can expect to do that I shall quote at some length from his unanswerable speeches. Said he:

I have this to say to the House, and especially to those who have any doubt about the population of Oregon, that, for myself, I hold that there can be no question but that there is sufficient population there to require us, under existing laws and compacts, to admit that Territory as a State into the Union. There must be at least 60,000 people there.

He then quoted section 14 of the Oregon organic act of August 14, 1848, and the latter part of the fifth article of compact of the ordinance of 1787, and continued:

If there were any question as to whether there were 90,000 people there; if there were any question as to whether Oregon comes up to the ratio of representation; yet, sir, I hold that there is a solemn guarantee and a compact made with those people which we ought not to disregard. That there are more than 60,000 people there, it seems to me no gentleman upon this floor can doubt. * * * By their admission we get rid of the Territorial expenses. They possess all the elements for a State government, which they should have under the guarantee I have referred to.

And again, in closing the debate:

Apart from considerations of public duty and justice to the people claiming this admission there is another consideration which enlists my entire energies for the bill. That, sir, is the opportunity it affords me as a Southern man, and one acting with the Democratic party, to show the groundlessness of the charge made last year, that we were in favor of putting one rule to a State applying with a slave State Constitution and another and more vigorous rule to a free State application—that we required a larger population for the admission of a State not tolerating African slavery than one permitting and allowing it. * * * The position of Kansas and that of Oregon are totally dissimilar; and whatever consideration of duty, looking to the peace and quiet of that country, as well as the general welfare, may have induced me and others to put the population restriction upon any future application of Kansas, like considerations of duty of a higher character, acting as

we now are, under existing obligations which we cannot ignore, forbid that the same representative ratio rule should be extended to Oregon. As I stated in my opening remarks, under existing compacts, under existing laws, affirming and extending what all regarded as a most solemn compact, the ordinance of 1878, it is in my judgment a high obligation to admit Oregon as soon as she has sixty thousand inhabitants.

The clause in the Kansas compromise bill, refusing to bear any further application for admission from her in case of her declining to come into the Union under her then application, with the modification of her land proposition which we submitted, until she had a population equal to the representative ratio, may or may not have been right, according to the opinions of gentlemen. The policy of adopting such a general principle in all cases where it can be done may or may not be right, as gentlemen may vary in their opinions; but that question cannot arise in the case of Oregon. We are foreclosed on that point in the Territorial organic act, and I appeal, not only to this side of the House but to every side, and ask how they can get round that obligation in the Territorial bill of Oregon of 1848, which declares solemnly that all the guarantees, privileges, and rights secured to the people of the Northwest Territory should be extended to the people of Oregon!

No such guarantee as this was ever given to the people of the Territory of Kansas. If there had been, that representative-ratio feature could not have been put in the conference bill without a violation of plighted faith. * * * The question before us at this time is simply whether we will discharge an existing obligation.

The Territory was defined and the compact entered into with the people, with the inhabitants; and that compact was, that as soon as they had sixty thousand free inhabitants they were to be entitled to admission as a State; and further, so far as it can be consistent with the general interest, such admission shall be allowed with a less number than sixty thousand inhabitants. There is no escape from this; nor are we without some lights as to a proper construction of these words. It is the same identical guarantee that was extended to Tennessee in 1790; and how was this language interpreted by those who made the compact? How was it construed by the great lights of the old Republican party? This identical question came upon the admission of Tennessee. * * * The debate on that question was referred to yesterday. There is no dodging the question, no evading it. The question here, so far as population is concerned, is the same as that on the admission of Tennessee. The only fact in issue now before us is the fact that was in issue then. It is not whether the proposed State has ninety thousand or one hundred thousand, but simply whether it has sixty thousand inhabitants. * * * It is no question of ninety-three thousand here. It is no question of what is the ratio in other Territories. It is no question of Kansas discrimination. It is the simple, naked question of fulfilling obligations. That is the whole of it. I have no doubt that she has sixty thousand; and every man upon this floor so believing, according to this authority, is bound to vote for her admission.

Mr. Clark, of Missouri, in the course of that debate, also said:

I take the ground that Oregon is entitled to admission into the Union with her present population, if it be sufficient, in the opinion of the House, to enable her to organize a practical community for State purposes. I claim that Oregon has a right to come in under the ordinance of 1787, and that it is the duty of Congress to admit her on the same principle and according to the same rule established in that ordinance for the Northwest Territory. Sir, if gentlemen will read the organic act of Oregon they will find that it is provided in that act that she shall be entitled to all the privileges and subject to all the limitations contained in the ordinance of 1787. That ordinance provided that when there should be 60,000 inhabitants in those Territories they should have a right to be admitted as States. If, then, you take the ordinance of 1787 and the organic act of Oregon you cannot escape the conclusion that you must admit Oregon when she has a population of 60,000.

Mr. Hughes was brought in from his sick-room, and also made a speech in favor of the bill, in which he used this language:

The Territory of Oregon was organized by act of Congress in 1848: * * * the provisions of the famous ordinance of 1787 were put in force in the Territory of Oregon by act of Congress. * * * Here is an enabling act for Oregon, pledging to her people admission into the Union with 60,000 free inhabitants or even with a less number if "consistent with the general interest of the confederacy." * * * Go then, freedom shrieker! Vote against Oregon. But remember you vote against the compact of the ordinance of 1787 expressly extended to that Territory by act of Congress. You vote against "popular sovereignty," and deny to the people of Oregon the right to "regulate their domestic institutions in their own way."

Now, Mr. Speaker, Washington, comprising another of these subdivisions of the original Oregon Territory, now stands where her elder sister then stood. She is the second applicant for admission, and is to the State of Oregon what Indiana—the second formed from the Northwest Territory—was to Ohio. When

INDIANA,

with 63,879 inhabitants, was knocking at the door of the Union, the committee to whom her memorial was referred reported to this House, January 5, 1816—

That said Territory is a portion of the territory northwest of the river Ohio, which, by the ordinance for the government thereof, was ordained to constitute not less than three nor more than five States; that the ordinance aforesaid, whenever the Territory of Indiana shall possess 60,000 free inhabitants, guarantees to those inhabitants the benefit of being admitted into the Union upon an equal footing with the original States. * * * Your committee, believing the said Territory to possess a population of 60,000 free inhabitants at least, deem it unnecessary to offer any further reasons in support of the expediency of granting the principal prayer of the memorialists; and therefore beg leave to report a bill to enable the people of the Territory of Indiana to form a constitution and State government on conditions not less advantageous and similar to those heretofore granted to other Territories of the United States.

And, sir, when

MICHIGAN,

another of the subdivisions of that territory, coming along later, presented her claim to admission, she rested her case upon the same plea. The memorial of her Legislature, passed January 8, 1833, contained the following language:

And your memorialists further represent that, under and by virtue of the ordinance of Congress passed the 13th day of July, A. D. 1787, for the government of the territory of the United States northwest of the river Ohio, it was, among other things, ordained that there shall be formed not less than three nor more than five States; and providing, if Congress find it expedient, that one or two of said five States should be formed in that part of said territory which lies north of an east and west line of the extreme southerly bend of Lake Michigan, and that any of the said States shall be admitted into the Union on an equal footing with the original States in all respects whatever, with liberty to form a permanent constitution and State government in conformity with the principles contained in

the articles of said ordinance, whenever such State have 60,000 free inhabitants therein.

And your memorialists further represent that Michigan Territory * * * is a part of the territory to be divided into States, according to the provisions of the fifth article of compact of the said ordinance of 1787, and that Michigan Territory so bounded, (and which, before its organization as a State can be consummated,) will, as your memorialists believe, contain 60,000 free inhabitants, is entitled, according to the said ordinance * * * to be constituted a State.

Anticipating that Michigan would soon have 60,000 people, as a concession to them, and not to erect another barrier in the way of their ingress into the Union, the ratio number was first proposed by Senator Tipton, then having charge of her application and that of Arkansas, who, in presenting the matter May 9, 1834, said:

I will not disguise the fact that I feel more than an ordinary solicitude for the passage of the bills permitting the people of Michigan and Arkansas to form constitutions and for their admission into the Union of the States. * * * What can be said in favor of one of these Territories may as truly be said of the other, and my amendment, if adopted, places the admission of both on equal grounds, depending on the contingency of each Territory having 47,700 inhabitants, the same population that entitles a like number to a Representative in Congress from the other States. * * * The ordinance of July, 1787, for the government of the territory northwest of the Ohio River, may be called the foundation of good government in that country. This ordinance provides the means of education, regulates the descent of property, and holds out inducements to young men to emigrate to the West. Article 5 provides that the Northwest Territory shall be divided into not less than three nor more than five States, as Congress may deem proper. * * * And whenever any of the said States shall have 60,000 inhabitants it shall be admitted into the Union on an equal footing with the original States in all respects whatever. The same ordinance also goes on to say that so far as it may be consistent with the general interest of this confederacy, States may be admitted at an earlier period and with a less number than 60,000.

It is not matter of surprise that the people of the Territories should be anxious to form State governments. This is always the case. The Federal officers in the Territories depend upon the President and Congress for office and for emolument, and not on the real sovereign, the people; and in my opinion the people act wisely in submitting to the burden of State government for the dearest rights of freedom, that of choosing their rulers.

Baffled for the time by the refusal of Congress to adopt this proposition, Michigan, without the national authority, proceeded to institute a State government. Discussing the validity of her action in so doing the supreme court of the State subsequent to her admission, in an opinion delivered by Ransom, J., in *Scott vs. Young Men's Society's Lessee*, and reported in 1 Douglas, declares at page 135:

The people of the original States, at the termination of the revolutionary contest, found themselves overwhelmed with a debt which they were unable to discharge. * * * For the purpose of providing the means to pay this debt extensive tracts of land were ceded to the Confederation by Virginia and other States. These lands were an unreclaimed wilderness peopled only by savages, and consequently unproductive and valueless to the Treasury. To induce their settlement and sale was therefore an object of the first importance to the States, and to effect this object the terms contained in the ordinance of 1787 were proposed. The Confederation in that act in effect said to those who should emigrate to either division of the Northwest Territory: "If you will buy, reclaim, and settle our waste lands, and thus replenish our empty treasury, and at the same time protect our widely extended northwestern frontier from the incursions of the Indians, we will provide for your government until your number shall reach 60,000, and then you shall be at liberty to form a State government for yourselves, and shall be admitted into our union of States on an equal footing in all respects with ourselves." To this compact the people who settled in the new State of Michigan became a party and entitled to insist on the fulfillment of its terms by the General Government.

Now, turning back to page 134, the court in the same opinion further declares:

To gain admission in fact into Congress the State must obtain the assent of that body, not because she does not possess a positive and unequalled right, under the ordinance, to such admission on an equal footing with the original States, with her boundaries as defined and agreed to in that instrument, but for the sole reason that the older States represented in Congress, who are the other party to the compact, have the physical power to refuse a compliance with the terms of an agreement which they have deliberately made, and there is no third party to which the State—the weaker party—can resort to coerce a fulfillment of the agreement.

Now, Mr. Speaker, the portions of this opinion just read, whatever may be said of other portions, cannot be gainsaid, and lead to the inevitable conclusion that Congress cannot, without a gross violation of public duty, longer delay the passage of the present bill. May I not hope that Congress will show the same scrupulous regard for our rights as was shown in

THE CASE OF THE MISSISSIPPI TERRITORY.

I have already quoted the article in the Georgia cession, requiring the admission of Mississippi as soon as she might have 60,000 free inhabitants. Congress became desirous of dividing the Territory into two States, and, in order to accomplish their object without the least infringement of the right of admission so secured, adopted the plan suggested in the report made to the Fourteenth Congress by Mr. Latimore, from the select committee having the matter in charge, from which I quote:

The Mississippi Territory contains, according to a census lately taken under an act of the Legislature and furnished by the secretary of the said Territory, 75,512 souls, of whom 45,085 are free white persons, 356 free people of color, and 30,061 slaves. By the articles of agreement between the United States and the State of Georgia it is stipulated that this Territory shall be admitted into the Union as a State when it shall contain 60,000 free inhabitants, or at an earlier period if Congress shall deem it expedient. Hence, it appears that its admission at this time depends not upon the claim derived from the above-mentioned agreement with Georgia, but upon a liberal policy on the part of the United States. It would seem to be superfluous in your committee to recommend that considerations of a deficiency of numbers be waived in this case, seeing that the House of Representatives have passed three bills at different periods for the admission of this Territory when its population was much smaller than it is at this time. * * * Your committee are of opinion that the Mississippi Territory should be divided by a north and south line for the purpose of erecting the same into two separate and independent States. * * * But, in recommending a division of this Territory, your committee beg leave to

suggest such a plan of division as will not probably retard the admission of either part beyond the period at which its inhabitants would be entitled to a State government in virtue of the agreement between the United States and the State of Georgia.

WHY THE COMPACT WAS MADE WITH US.

Mr. Speaker, until within the last forty years but little was known of our territorial acquisitions in the Pacific Northwest. Lewis and Clarke in their celebrated tour across the continent, following the deep cavernous course of its great river, saw little but rocks and sand and sage. When Dr. Marcus Whitman, one of the early American missionaries to the Indians, whose name should ever be cherished as a great benefactor of his nation, arrived at this capital, after his hazardous midwinter trip from that far-off region in the spring of 1842, negotiations were in progress to exchange it all for a cod-fishery, which he succeeded in defeating. Obtaining through him more accurate information as to its character and value, and the progress made by our national rival, Great Britain, in colonizing it with its own subjects, our Government began to make strenuous efforts to rescue it from their threatened grasp. But it was too late; and when the boundary was agreed upon, we lost that valuable portion lying between the parallels of 49° and 54° 40' north latitude, and began to have serious fears of losing the balance. Its speedy settlement and occupation by our own citizens became very important. Distance and danger intervened. Two thousand weary miles of "waste-howling wilderness," swarming with hostile savages, must be traversed by slow and tedious modes of travel before it could be reached. Hardship, danger, privation, and desolation, such as none save him who has undergone it can realize, awaited the intrepid emigrant all along his tiresome journey and after he had reached the end.

Who, sir, was ready for the sacrifice—ready to give up home, friends, all the comforts of life, and all the privileges of citizenship in the older States of the Union? And yet, sir, it was necessary, in order to save this rich heritage of the nation for the common benefit of its people, that some must go. Congress, to encourage their going, granted them lands, promised them protection, and made this legislative compact for the early restoration of their political rights, their early admission into the Union.

CONCLUDING APPEAL.

Mr. Speaker, over thirty years ago, and in less than four years after the making of that compact, I became an inhabitant of that far away portion of our vast country, and I know by experience something of the dangers and difficulties encountered, and the hardships and privations endured by those early settlers. In their behalf and as one of them I call upon you for the fulfillment of your promise, the redemption of your pledge, the discharge of your obligation, the performance of your compact. You cannot longer delay without the breach of all these.

For three years they have had the requisite 60,000 people, the maximum number required by the compact you have solemnly made with them, more by the last census than any State has had at the census preceding its admission except Vermont and California, and now have more than double the required 60,000; more, sir, than twenty-one States have had when you admitted them into this Union. For three years, in gross and inexcusable violation of that compact, in gross and inexcusable violation of the spirit and genius of free government, in gross and inexcusable violation of the fundamental principles of the Constitution, and of right and justice, you have kept them in provincial subjection to the rest of their fellow-citizens of the United States, and have denied them the just participation in the government of their common country. Their executive and judicial officers have not been of their own choosing, but have been appointed by your President, in whose election they have had no voice, and who, with but two exceptions, never set foot upon their soil. Your Congress, in which they have had no vote, has made or supervised the making of, or at its pleasure annulled their laws.

Mr. Speaker, is any gentleman on this floor willing to be deprived of his vote in this body; willing to have the Senators of his State sent home; willing to have his governor, judges, and other State officials deposed and their places supplied by strangers, who feel no interest in the welfare of his people, appointed by the President of the United States; willing to have the right of himself and constituents to participate in the election of that President taken away, and to have the acts of their State Legislature subject to abrogation by Congress?

Sir, the people's right of self-government constitutes the foundation stone of our grand political fabric. It is the dearest right of freemen; "the right preservative of all rights." Indeed, without it none can be freemen. For this the sanguinary struggle of the Revolution was waged, our independence established, and our Constitution formed.

A free, republican government derives all "its just powers from the consent of the governed;" and it is our common boast that "this is a Government of the people, by the people, for the people." The Territory of Washington is a part of the United States. Its inhabitants are citizens of the United States, endowed by their Creator with the same inalienable rights as other citizens of the United States. They have done nothing to forfeit those rights. And, sir, in their name and by their authority I now call upon you and upon this Congress for their recognition by the early consideration and passage of this bill for the formation and admission of the State of Washington.

Internal-Revenue Taxation.

And it shall come to pass in that day that the burdens shall be taken from off thy shoulders and the yoke from off thy neck, and the yoke shall be destroyed.

SPEECH

OF

HON. ALFRED M. SCALES.

OF NORTH CAROLINA,

IN THE HOUSE OF REPRESENTATIVES,

Friday, June 23, 1882.

The House being in Committee of the Whole on the state of the Union, and having under consideration the bill (H. R. No. 5538) to reduce internal-revenue taxation—

Mr. SCALES said:

Mr. CHAIRMAN: I confess, sir, to a feeling of disappointment when this bill was reported, and I hazard nothing in saying the country will be disappointed. We had the right to expect better things of the committee. They had in charge the ways and means by which this Government was to be supported, and they owed it to the people in the discharge of their high trust to see that no more money was extracted from them than was absolutely necessary to pay the expenses of the Government honestly and economically administered, and to provide for the gradual and easy payment of the public debt. We had been led to believe by many utterances of the venerable and distinguished gentleman who is now chairman of that committee, Judge KELLEY, both before and since the assembling of the Forty-seventh Congress, that the time had come when justice to the South as well as to the whole people demanded, without prejudice to the Government, that the internal-revenue taxes should be greatly reduced if not abolished. He said, to use his own language, in a speech to which I invite the attention of the House, delivered on November 29, 1881, in New York:

The time has come when we must determine whether our system of internal taxes shall be abolished or perpetuated. If these taxes are to be perpetuated, the present Congress or its immediate successor must revise our entire revenue system. If the reduction of revenue, which is inevitable, be long delayed, our excessive income will require changes so sudden and momentous as to convulse our financial, industrial, and commercial systems.

During the last fiscal year we paid more than \$101,000,000 of debt. To do this required the abstraction from the current income of the people of \$60,000,000 in excess of the ordinary expenditures of the Government and requirements of the sinking fund. This year, judging by the receipts for the first four months, we shall pay \$150,000,000 of debt, and shall exact from the people more than \$100,000,000 in excess of current expenditures and the requirements of the sinking fund.

Again he says:

The diversified interests of the South are in their infancy. The capital they create each year is applied to their extension, but more than can be thus produced is required for their rapid development. They need the fostering care of the Government, and in no way can this be bestowed more acceptably than by the immediate repeal of our internal-revenue taxes. Most of the Southern States are heavily burdened with debt. Should the Government, in view of our overflowing Treasury, remit to these States all the ordinary sources of taxation, it would inspire their people with a new measure of confidence in the North and with faith in their own ability to pay their outstanding obligations. The fact that they need what revenue may be justly derived from these sources, and that the nation does not need what it collects, is frequently referred to by Southern Representatives in justification of the prevalent belief that these unnecessary taxes, imposed for conquest, are retained in a spirit of vindictiveness.

I have hastily invited your attention to the destructive effect of the match tax upon manufacturers whose capital was small. But the taxes on spirits and tobacco have been more harsh and aggravating in their effect on the holders of small tracts of land in many parts of the South. As many Pennsylvania farmers prior to 1861 distilled each year a few barrels of pure whisky to sell after it should have attained a given age, so Southern owners of small orchards, or of a few fruit trees around the dwelling-house, were in the habit of distilling their fruit. It was to the sale of their peach or apple brandy that many of them looked for the cash with which to pay taxes and doctors' bills, and to procure an occasional article for the comfort or adornment of their homes. Others, not fortunate enough to own an orchard, distilled part of their corn, and thus secured their small annual supply of money.

The spirit tax effectually deprived these classes of their habitual dependence for ready money. The entire crop of many of these people was not sufficient to justify a compliance with the law; and many an honest man has been driven to the painful alternative of seeing his crop of fruit rot upon the ground, or of engaging with his neighbors in a treaty offensive and defensive against all persons engaged in the collection of the spirit tax.

The case of the owner of a small piece of ground devoted to tobacco growing is scarcely less painful, and must invest the "moonshiner" with his sympathy. Under the provisions of the law he may not sell an ounce of his crop to his neighbor, nor to any citizen who is not a licensed dealer in leaf tobacco. There are many thousands of these people for whose small crop there would be a ready market in the neighborhood, whose entire production is too small to pay for its transportation to a distant center of trade, or even to invite visits from traveling purchasing agents. These poor men must therefore barter their crop at the neighboring store at such prices as the single customer will offer, and for such goods as he is prepared to give in exchange.

I may not extend these illustrations, but in conclusion would repeat that justice to the South requires the earliest possible repeal of the entire system of internal taxes; and I aver that the abolition of these taxes would do more to harmonize the country than any single act of legislation that statesmanship can suggest. I trust it may be done and done quickly.

Up to this time we had been told by the Republican party that spirits and tobacco were luxuries and should pay the taxes; that the consumers paid them and the producers were not concerned, and some went so far as to say that these articles should forever pay the

taxes. Now, Judge KELLEY admits the hardships imposed upon these industries, especially in the South, already wasted and impoverished by war. He enters into our troubles, gives us his sympathy, and in language strong and earnest demands that the burdens should be removed. He is made chairman of the Committee on Ways and Means. Time and again in this capacity he repeats in substance the same sentiments. The way is opened; his position, his convictions, and his influence combined give assurance that the relief so long hoped for is at hand. I risk nothing, therefore, in saying that the country is disappointed in this bill; that we had a right to expect better things. This bill contains three sections. The first section proposes at this time to repeal the following taxes:

Capital and deposits of banks and bankers other than national.....	\$3,762,208
Capital and deposits of national banks.....	5,372,178
Bank checks.....	2,253,411
Matches.....	3,278,580
Proprietary medicines.....	2,226,503
Total.....	16,892,880

Of this sum the banks will be relieved to the extent of \$11,387,497 and matches and patent medicines to \$5,505,383.

The second section proposes after May 1, 1883, to reduce the special license taxes, amounting to about..... \$3,700,000

The third section reduces tax on cigars and cigarettes from \$6 to \$5..... 2,666,000

Amounting to..... 6,366,000

The total reduction may be stated thus:

Banks, bankers, and stamp taxes.....	\$16,892,880
Special license taxes.....	3,700,000
Cigars and cigarettes.....	2,666,000

Total reduction by bill..... 23,258,880

That the taxes should be reduced largely none will deny. The extent of the reduction depends upon the receipts and necessary expenditures of the Government. That we may understand the burdens to be relieved, by whom, upon what articles, and where paid, I call attention to the collections of Government since 1863, a period of nineteen years:

From spirits there have been collected from 1863 to 1882.....	\$834,990,279
From tobacco there have been collected from 1863 to 1882.....	548,000,254
From fermented liquors there have been collected from 1863 to 1882.....	146,976,909
From banks and bankers there have been collected from 1863 to 1882.....	61,540,472
From penalties there have been collected from 1863 to 1882.....	10,859,910
From adhesive stamps there have been collected from 1863 to 1882.....	193,250,082
From articles and occupations formerly taxed, now exempt.....	1,146,465,593

Total paid in nineteen years..... 2,792,081,659
An average each year of \$158,004,299.

I had occasion some time since to call the attention of the House to the amount of taxes paid by some of the States more immediately interested in the articles taxed to the General Government in 1881, and I propose to repeat that, and compare those taxes with the amounts paid to the State governments in the same year.

Indiana pays to United States Government.....	\$7,281,254
Indiana pays to State government.....	2,764,851
Illinois pays to United States Government.....	25,784,682
Illinois pays to State government.....	2,140,000
Kentucky pays to United States Government.....	8,719,162
Kentucky pays to State government.....	2,322,334
Maryland pays to United States Government.....	2,483,463
Maryland pays to State government.....	998,320
Michigan pays to United States Government.....	1,787,275
Michigan pays to State government.....	804,831
Missouri pays to United States Government.....	6,470,349
Missouri pays to State government.....	2,129,512
New Jersey pays to United States Government.....	4,873,676
New Jersey pays to State government.....	820,000
New York pays to United States Government.....	17,233,268
New York pays to State government.....	9,253,542
North Carolina pays to United States Government.....	2,476,440
North Carolina pays to State government.....	420,000
Ohio pays to United States Government.....	19,295,836
Ohio pays to State government.....	4,479,099
Pennsylvania pays to United States Government.....	7,669,214
Pennsylvania pays to State government.....	6,328,896
Tennessee pays to United States Government.....	1,146,764
Tennessee pays to State government.....	626,529
Virginia pays to United States Government.....	6,063,106
Virginia pays to State government.....	2,067,678
Wisconsin pays to United States Government.....	2,910,095
Wisconsin pays to State government.....	662,058

From this statement it will be seen that these States, all of them, pay largely more, and many of them from 1 to 1,200 per cent. more taxes to the United States Government than to the State. Those taxes in 1881 amount to \$135,229,912.30, and if the increase so far in this year should be maintained the amount collected will be \$157,000,000. Nearly \$3,000,000,000 have been dragged from our people in the last nineteen years by the United States Government, and about \$150,000,000 each year, and that, too, after we had been exhausted and our substance wasted by a destructive civil war. This does not include the heavy taxes paid by the people upon the necessities of life in tariff duties. I am dealing now only with the internal revenue. Is it possible that so large a sum can be taken annually from the States and the people not feel the burden?

It cannot be. It is felt and felt deeply in every branch of business

by capital and labor, by rich and poor, and by white and black. It has in the past paralyzed our industries, crippled our energies, ending often in repudiation, bankruptcy, and ruin. It is true we have had a season of great prosperity. Providence has given us the early and latter rains, and we have reaped bountiful harvests, and these added to the energy, skill, and economy of the people, have for a time bridged over the troubles incident upon such a drain, but they will come as certain as effect follows cause, as the night the day; one bad crop here or a good one in Europe will hasten the end. Already we hear the murmuring of discontent and strife. Labor strikes for higher wages; capital rejects its demand, and both justify themselves by the necessities of the case. The gentleman from New York [Mr. HEWITT] has forcibly presented this idea, and traces the present trouble unmistakably to the heavy expenditures of the Government and the exhaustive taxation upon the people.

The statement of the case at once suggests the remedy. Reduce, and reduce largely, the taxation and keep in the pockets of the people a large share of that which is now paid out to the Government. Can this be done without prejudice to the Government? If not, whatever the result, the tax must stand; but if it can, surely all will aid in accomplishing so desirable an end. The distinguished gentleman from Pennsylvania has presented the facts and figures in so forcible a way that I cannot do better than to repeat them:

Mr. Chairman, a contemplation of the financial condition of the country presents a spectacle such as never was seen before in the world's history. Our revenues increase so enormously, and the fixed charges against the Treasury decrease so rapidly, that our accumulating surplus revenue is regarded by thoughtful and conservative business men as a fruitful source of danger. Last year we collected \$360,000,000 of revenue from all sources, and we had a surplus of \$100,000,000. This year we shall collect over \$400,000,000, and our expenditures have been greatly reduced.

At the opening of each month for many years past Mr. Carson, the accomplished clerk of the Committee on Ways and Means, has made analytical statements of the receipts and expenditures of the preceding month, and of the past months of the fiscal year. I have two of these statements before me. The one dated April 30 shows that in each quarter of the current fiscal year there has been an increase of receipts from each of the three sources of revenue, customs, internal taxes, and miscellaneous, showing that the increase is steady, continuous, and in every source of revenue. Mr. Carson said:

"The annexed tabulated statement will show the receipts, by quarterly periods, for the nine months of the fiscal year ending June 30, 1882, compared with the corresponding periods of the preceding fiscal year:

Sources.	1882.	1881.
First quarter:		
Customs.....	\$50,184,406	\$56,305,144
Internal revenue.....	37,575,502	32,496,422
Miscellaneous.....	11,421,072	8,997,674
Total.....	108,181,043	97,889,240
Second quarter:		
Customs.....	49,049,544	42,241,041
Internal revenue.....	37,884,263	34,695,803
Miscellaneous.....	5,764,975	4,757,500
Total.....	92,698,782	81,694,344
Third quarter:		
Customs.....	58,277,685	48,747,011
Internal revenue.....	30,074,011	30,020,086
Miscellaneous.....	10,325,563	8,407,472
Total.....	98,677,259	87,174,509

"The following recapitulation shows the total receipts and expenditures for the nine months of the two years respectively, from the several sources named:

RECEIPTS.		
Sources.	1882.	1881.
Customs.....	\$166,511,698	\$147,383,196
Internal revenue.....	105,533,976	97,212,311
Miscellaneous.....	27,511,610	22,162,646
Aggregate.....	299,557,084	266,758,153
EXPENDITURES.		
Sources.	1882.	1881.
Ordinary.....	\$138,014,577	\$137,783,572
Interest charged.....	56,862,300	66,490,832
Total.....	194,876,876	204,274,404
Net surplus.....	104,681,227	62,483,749

Mr. Chairman, these figures show that at the end of those nine months there was exhibited a reduction in the interest charge from \$66,490,000 to \$56,862,000. The increase in ordinary expenditures was but from \$137,783,000 to \$138,014,000; so that while in the first three quarters of 1881 we expended \$204,000,000, we expended during the first nine months of 1882 but \$194,000,000; and the net surplus which at the end of the first three quarters of last year was \$62,483,000 was at the end of these three quarters \$104,000,000, an increase of \$42,000,000.

In Mr. Carson's analytical statement of June 1 he shows that the bonded debt had been reduced \$15,000,000 during the month of May, and added:

"The receipts for May were upward of \$36,500,000, an increase of \$4,500,000 compared with May, 1881. For the eleven months ending yesterday, the receipts were \$374,425,381, or nearly \$14,000,000 greater than for the twelve months ending June 30, 1881. The estimated receipts for the current fiscal year were \$400,000,000, and it is probable that this estimate will be exceeded by at least \$5,000,000. The receipts for this fiscal year will be greater than for any preceding year since 1870, when they were over \$411,000,000. Last month internal-revenue receipts were greater than for any month since 1870. The following table shows the receipts respectively for May, 1881 and 1882:

Sources.	1881.	1882.
Customs.....	\$16,642,062	\$18,197,754
Internal revenue.....	13,989,326	15,504,310
Miscellaneous.....	1,602,326	2,849,239
Total.....	32,233,714	36,551,303

We had \$100,000,000 of surplus last year; and when we shall have abated \$17,000,000 of taxes, we shall have about \$135,000,000 next year.

Treasurer Giffillan says:

"The interest charge on the public bonded debt as it stood June 30, 1881, was \$75,018,695; on the public debt as it will stand on the 30th instant it will be \$57,365,088—a reduction of \$17,653,607."

I have adopted these figures because they came from the chairman of the Committee on Ways and Means, who is the organ of the Administration in the House, and they are singularly confirmatory of the estimates of the Secretary of the Treasury for the year 1882, with a difference in favor of the Government in receipts of about \$5,000,000, and in reduction of interest, as shown by actual verification on 30th of June, 1882, of \$17,653,607. This gives us, then, on 30th of June, 1882, about \$152,000,000 surplus, after paying up everything except sinking fund. Deduct sinking fund and we have a surplus of \$75,000,000 that must go into the Treasury, to be wasted, I fear, in reckless extravagance, which comes of an overflowing Treasury. These figures cannot be controverted. They come down to 30th June, 1882. There is no estimate, no guess, about it; but they are verified by actual count.

For the year 1863 the estimates of the Secretary of the Treasury in receipts are \$400,000,000; expenditures, exclusive of sinking fund, \$234,850,793.43; balance, \$105,149,206.57. Deduct sinking fund, which must be paid, \$45,611,714.22, will leave a surplus of \$59,537,492.35.

The expenses this year are increased over last year \$56,069,257.60, and yet, after paying the expenses thus increased and \$45,000,000 to the public debt, we have still a surplus of \$59,537,492.35. This estimate also embraces \$100,000,000 paid to pensioners, but does not take into account the reduction in the interest. The amount of annual interest had been reduced by payments to 30th June, 1882, \$57,365,088, whereas it is charged in the estimates of 1883 at \$65,000,000, a difference of \$7,634,912. Add this to \$59,537,492.35, and we have a surplus of \$67,446,912.

Now, if we reduce the taxes on spirits to 50 cents per gallon, it would reduce the revenue \$23,000,000, and to 10 cents on tobacco, it would be \$8,812,000; abolish tax on checks, \$2,253,411; matches, \$3,278,580, and we have a reduction of \$32,343,991. This would be a great relief to the industries, and it would be distributed much more equally than the bill proposed, and thus leave a surplus for all contingencies of \$35,102,921. Experience in reducing the tobacco tax has proved that such a reduction in taxes would probably increase the revenue, and with proposed reductions on tobacco and whisky we might safely calculate upon an increase in receipts of \$10,000,000, which would give a surplus of \$45,102,921.

But if, instead of this, we abolish all tax on tobacco, it will reduce the revenue \$42,854,991.31; abolish tax on brandy, \$1,531,075.83; bank checks, \$2,253,411.20; matches, \$3,278,580.62; we would relieve the people to the amount of \$49,918,058.96. This would also enable us to abolish about three-fourths of all the revenue offices, and thus save about \$4,000,000, and have a surplus still in the Treasury of \$21,528,853.04.

Mr. Chairman, I have suggested these two propositions as substitutes for the bill in the hope that gentlemen who are doubtful as to the propriety of abolishing the whole internal tax might be induced to go beyond the narrow limits of the bill and accept the one or the other in the interest of a general, just, and liberal relief. But I assume a much more advanced position; I want to see the whole system of internal revenue abolished. I believe that every dollar unnecessarily extracted from the pockets of the people is robbery, and every dollar diverted from the national channels sanctioned by the Constitution is a grave breach of trust, without justification or excuse.

We can never too much admire the wisdom and high sense of duty of those statesmen in the past who insisted always upon a strict construction of the Constitution. It was the only grant of power from the people, and there was no discretion beyond. Hence, their highest aim was to know and obey it. When expansion is once resorted to the instrument is prostituted, and will be disregarded, or made to mean anything that local prejudice, corrupt extravagance, or selfish ambition may dictate. There is no safety except within its clearly-defined boundaries; transgress them, and we are like a ship at sea without chart or rudder. This loose construction by the party in power is the fruitful source of all the ills that have befallen the Republic.

It brought on the bitterness and strife which ended in secession and civil war. It subjugated States and consigned them to a military despotism. It disfranchised free white men and turned them over to the tender mercies of their former slaves. It surrounded the ballot-box with bayonets, degraded the ballot and had it counted by military power. It counted in and inaugurated a President that had never been elected and gave the Republic its first usurper. It blotted out State rights and consolidated power in the General Government. It brought wild and reckless extravagance and corruption into high places, and will eventually, if unchecked, bring repudiation and death to the Republic.

To-day the Republican party are drawing four hundred million dollars annually from the people. In the language which the prophet puts in the mouth of the corrupt and haughty king of Assyria, they can say:

"We have removed the bounds of the people, and have robbed their treasures, and have put down the inhabitants; our hands have found as a nest the riches of the people, and as one gathereth eggs that are left we gathered all the earth; and there was none that moved the wing, or opened the mouth, or peeped."

Two hundred and fifty millions are ample, honestly and economically administered, to defray all the ordinary expenses of the Government, and to pay fifty millions annually to reduce the public debt. Upon this basis we can in the main abolish the internal revenue. For the last five years, when the Democratic party had a majority in Congress, we spent—

In 1877.....	\$141,535,497 35
In 1878.....	134,463,452 15
In 1879.....	161,619,024 58
In 1880.....	171,885,382 67
In 1881.....	178,204,146 41

But for the year 1883, the first year after the Republicans come into power, the ordinary expenditures are estimated at \$290,000,000, and may reach over three hundred million. What is to become of it? Where is it to go? It is to be used in a river and harbor bill, which is in excess of any heretofore passed in the life of the Government. It is to be used in paying a civil pension list, not large now, but may in a few years involve millions of dollars.

It is used in war pensions, which this year reaches one hundred million dollars, and next year may reach one hundred and fifty million dollars. Money has been used corruptly and fraudulently more or less in nearly every branch of the Government. Within these last four years we have seen discrepancies amounting to millions of dollars in the books of the Treasury, which after investigation is still unexplained and unexplainable, except upon the idea of ignorance or corruption, and ignorance is scouted. We have seen at this session, upon an investigation by a committee of the Senate, item after item upon the Treasury books purchased for a former Secretary of the Treasury, applied to his private uses and charged to and paid for by the Government. We have seen under the same investigation men employed and paid for by the Government, taken from their legitimate work and put in the service of the same head of the Department, without cost to him. Stationery, furniture, and other equipments for a private office we have seen paid for by the Government, charged on the books falsely and fraudulently under the head of *file-holders*. We have had at this session the humiliating admission that money appropriated to one object has been diverted and in contravention of law used for another. We have seen in the Revenue Bureau men employed and paid with money set apart by law for other purposes. We know that now while I speak an assistant Postmaster-General under Mr. Hayes, and a former United States Senator are indicted for conspiracy and fraud in letting out contracts and expediting services by means of which it is alleged they robbed the Government of millions of dollars.

It is conceded that the frauds upon the pensions law will amount to 10 per cent., which this year will be \$10,000,000, and this, too, in the face of the fact, and I say it with pleasure, that we have an able and honorable Commissioner at the head of the bureau. These things must stop. If the life of the Republic is to be preserved, we must have the Constitution for our guide, integrity in office, economy in expenditure, and taxation equal to and never in excess of the actual wants of the Government. In these different calculations we have not adverted to the fact that there is in the Treasury cash unexpended amounting to about \$140,000,000, subject to no call.

This will add force to the conclusions that with the present receipts and expenditures we can reduce taxes sixty-five or seventy million dollars, and if we lop off all extravagance and root out all fraud we can abolish the whole internal-revenue system, but instead of this we are met by the bill of the Committee on Ways and Means with a present reduction of about sixteen millions, the greater part of which is taken from the banks. Now, as I have said, I am in favor of a total abolition, and if I cannot get that I will vote to reduce all taxes equally as far as I can. But is it right when so many industries are burdened, when labor is groaning for relief, that we should only remember capital? If it is to be the policy of the Government to continue the revenue and pay off the debt as speedily as possible, surely the banks ought not to be entirely exempt. If tobacco and spirits and other articles of labor and skill, are to pay, should not, I ask in all fairness, the banks pay their part?

A few years ago the tax question was agitated, and the Republican party, then in power, abolished the tax on income. Now the same

party seeks to abolish the tax on banks. But it is said that tobacco and spirits are luxuries, and therefore should pay the taxes. But they are industries; they are the product of labor; they are made in the sweat of the brow. In many sections they form the only marketable product, are converted into money, and the money used to educate the children and to supply the families with the necessities of life. What are banks but the superfluous money raised and set apart over the necessities of life? What is income but an annual sum of profits above the wants and necessary expenditures of life? Which can best spare the tax? Take it off of banks and you take it off of capital. Keep it on tobacco and spirits and you create monopolies. Only those who have capital can pay the tax, and the result is that the tax drives all the small farmers and men of small means from the business and leaves it in the hands of capitalists, who make it a monopoly.

Tax luxuries! Mr. Chairman, I fear that this is not an honest utterance. Do you tax the manufacturers of the broadcloths, the purple and fine linen, the apparel of the rich? Do you tax the manufacturers of fancy and costly carriages, the jewels of diamonds, pearls, and gold? No, you do not. Are these luxuries? Yes, but they belong to capital. Do you tax the fancy horses, the magnificent palaces, and the \$100,000,000 with the vast income of the Vanderbilts and the Goulds? No, not these. Will you tax the national banks? No. We will exempt all these, but we will tax the luxuries, tobacco and spirits. But while we do this, we take it off of matches, which is also an industry. In other words, we will give free matches to the poor man and rich alike, for all must have matches, \$3,000,000; but we will give to capital and the rich man alone \$11,000,000. This may be right; but I cannot see it, and will not vote for it.

He is a demagogue that would seek to array labor against capital; they should go hand in hand; they are mutually dependent and should be equally protected. I want to protect both, I want to relieve both, but I will not relieve one at the expense of the other; I will not relieve banks at the expense of the industries of the country. Since I have been a member of Congress I have omitted no opportunity to reduce these taxes; I have introduced bills and offered amendments, spoken and voted, to this end. Never before have we been in a condition to abolish it entirely until now, and now it can be done and should be done. We are paying the debt at the rate of \$100,000,000 per annum, and at this rate we will pay all the bonds now subject to call in a little over four years; before the others are due. The three-and-a-half, amounting to about \$460,000,000, can be called at any time. The bonds at 4½, amounting to \$250,000,000, are payable on September 1, 1891, and the fours, amounting to \$738,884,300, are payable in the year 1907.

But if we could pay the whole off, is it desirable to raise so large an amount of money from the people in so short a time? A full Treasury begets extravagance and corruption. The danger is, with an overflowing Treasury, we will not apply all to the public debt, but will waste much in useless and corrupt appropriations. But as a question of economy, is it best to pay all the bonds as rapidly as possible, or to reduce taxes? The Government only pays 3½ per cent. interest on part of its debt. This will probably be reduced to 2 per cent. The money paid by the people in taxes is worth to them 8 per cent. Then, as a matter of pure calculation, is it not better that all the people together should pay 2 per cent., or even 3½, than that each individual shall lose 8 on the amount taken in taxes from him? To illustrate: the State of North Carolina pays over \$2,000,000 to the United States Government; the interest on that at 2 per cent. would be \$40,000. Let this amount remain in the hands of the people, and they can loan and make on it 8 per cent., which is 6 per cent. clear and amounts to \$120,000—a saving to the citizens of \$80,000.

The people demand the repeal of these laws. I appeal to the Representatives from Illinois, Indiana, Virginia, North Carolina, and others who pay mainly these taxes to hear this demand, to come to the rescue. It may be postponed, but I tell you it must go. Our fathers did not long endure such oppression. After the revolutionary war these internal taxes were imposed, and so odious were they that a serious rebellion was organized in Pennsylvania, called the whisky rebellion. It is true it was subdued, but the system was so odious that after eleven years it was entirely abolished, in 1802, when the ordinary expenses were about \$4,000,000 and the debt was \$86,712,632.25. In 1814 after our late war with Great Britain, these taxes were again imposed, but so restive were the people under them that in four years they were repealed, when the debt was \$81,487,846.24 and the expenses for same year \$30,127,686.38. In the first case the people in the eleven years had paid only \$6,112,097, and in the last \$14,143,852. And here let me again quote from Judge KELLEY's speech; it is forceful and pertinent:

To those who are living under a law which yielded in one year (1886) more than \$310,000,000, it may seem strange that the people were so impatient of the petty exactions of these earlier laws. To me the wonder is that this generation has not long since followed the example of its fathers in demanding immediate repeal. On this point Hon. D. D. Pratt, then Commissioner of Internal Revenue, in his annual report for 1875, said:

"These forms of taxation have never met with popular favor, and with the exception of the present revenue law have never maintained their footing upon the statute-book for any considerable time. The tax-gatherer from earliest history has been an unwelcome presence and his business an ungracious one. His office is inquisitorial in its very nature, leading to inquiries into people's affairs, the condition of their business, their losses and gains, matters which most people prefer

keeping secret from the public. The process of assessment and collection is summary, involving in case of delinquency penalties and sacrifice of property. The tax is a palpable thing to be paid, or some cherished possession is to be sold to meet it.

"No circumstances of poverty, misfortune, sickness, or death stay the distraint. Injustice in the assessment itself is relievable only by a circuitous process, involving first an application for abatement, next an application for a refund after the tax is paid or collected, and, these being overruled, an appeal to the courts against the collector. Here at last the claimant, who has insisted that he either owed no tax at all, or a tax less than that demanded, collects from the Government what he has compulsorily paid, but frequently at the expense of ruinous delay and sacrifice."

I cannot add, and will not attempt it, to the forcible picture of vexation and annoyance to the people thus presented by the collection of these taxes. But the question arises and is one of vast moment under all these facts and figures, under these utterances from Judge KELLEY, why was not a bill introduced to greatly reduce, if not totally to abolish, these taxes? The Democratic party stood ready, almost without exception, to aid in the work. Many individuals of the Republican party, including Judge KELLEY, believed it should be done. Why, then, I ask, was it not done? The responsibility, fearful as it is, rests somewhere, and I will place it to-day where it belongs, and I call the attention of the House and the country to it. The Republican party have a majority in both Houses of Congress. If they can keep their men together, they can prevent any legislation not agreeable to them, and are therefore to be held responsible.

The bills had been introduced; the Committee of Ways and Means were ready to make a favorable report. The party met in caucus, acted in Congress, where legislation is debated and matured and enacted, but in a party caucus, and determined that there should be no reduction in taxes on tobacco and spirits. Individual opinion is crushed out, the individual voice is hushed, and the representative will and judgment is lost in party caucus, and the representative bows submissively to a party edict. As this was done by party, we may safely conclude it was done for party purposes. This bureau, it is charged, and I believe, furnishes more money to control elections in the interest of that party than they get from any other source.

These taxes are dragged from the people and then used in corrupting the people in their elections. What becomes of the false and hypocritical cry we so often hear from them, "a free ballot and a fair count?" It simply means free and fair to those who vote the Republican ticket. This money will be sent to every district in the land and used to debauch the ballot-box. Who does it? Your Government? No, they dare not, but the king that overrides constitutions and laws and acknowledges no responsibility. It has been decreed by King Caucus of the Republican party. Bow your necks, oh, ye people, for this yoke, and meekly wear it!

But this is not all. Not only have they levied and collected all these taxes so many years from an impoverished people but the same party have levied a party tax upon every employé in this Government; they have spared neither age nor sex. The old man of three-score and ten, that has served the Government faithfully for fifty years, and the child of ten who as a page helps to feed and clothe his widowed mother, must alike obey the inexorable command. The cradle and the grave are both made tributary. The party must be sustained, and this cannot be done without money. How true it is that "they have found as a nest the riches of the people, and as one gathereth eggs that are left, they have gathered all the earth."

But it is said to be a voluntary tax, and it is announced on the floor of the House and elsewhere that the employés are at liberty to pay it or not as they please; but it is well known what that means. When a highwayman meets his victim he boldly proclaims, "Your money or your life;" and so every one understands this demand to mean when addressed to those in service of the Government "Your money or your place." They dare not risk anything, and the money is given. This, with all the other vast sums raised rightfully or wrongfully, will be used in the States to control elections. When they cannot elect a Republican, they will, as the next best thing, induce some Democrat to run as Independent. They furnish the money needed for the campaign, they support him, and use him.

The boasted Independent soon becomes dependent upon the Republican party, and this dependence soon brings about an alliance. So it was in Virginia, and so it will be everywhere. They easily adapt themselves to all creeds, according to the situation. In Virginia they clamor for repudiation and ally themselves with the Readjusters; in the North they are debt-payers to the last dollar and denounce repudiation; in Ohio they are prohibitionists, but in North Carolina they are against prohibition and demand free spirits. They impose the taxes; they fix the penalties; they put spies over the land, many of whom, without character or regard for law or liberty, maltreat and oppress the citizens, and yet claim to be the special friends of free spirits.

Mr. Chairman, the strongest government is that which rests upon the affections of its people. The purest government is that which draws from the people in taxes no more money than is absolutely necessary to defray its expenses economically administered. A superabundance of money begets waste, and waste begets temptation and corruptions. The richest government is that which in itself is poor but is cheerfully sustained by willing contributions of a wealthy and prosperous people. The best is that which unites them all in one.

The first session of the Forty-seventh Congress has been so far characterized in a remarkable degree by an absence in debate of all allusions which were calculated to rekindle the strife and bitter memories of the war. I gladly hail it as the dawning of a new era in legislation.

I congratulate the whole people upon its auspicious outlook. I would signalize its coming by wiping out these oppressive and vexatious internal-revenue taxes, the last vestige of the civil war. I would withdraw this ever-irritating and never-healing ulcer and restore the people to the proud consciousness that they were again free—free from the odious detective, free from the spies that infest the land and curse their homes, free from the pains and penalties of a cruel law; free to raise, free to sell, and free to buy the products of the farm on their own terms and in their own way, with no one to molest or make them afraid.

Internal-Revenue Taxation.

SPEECH

OF

HON. GEORGE D. WISE,

OF VIRGINIA,

IN THE HOUSE OF REPRESENTATIVES,

Monday, June 26, 1882.

The House, in Committee of the Whole, having under consideration the bill (H. R. No. 5538) to reduce internal-revenue taxation—

Mr. WISE said:

Mr. CHAIRMAN: I desire to be heard briefly in reference to the amendment offered by the honorable gentleman from Kentucky, [Mr. CARLISLE,] by which it is proposed to accomplish the equalization of the tax upon tobacco by providing that hereafter there shall be paid on cigars of all descriptions made of tobacco or any substitute therefor \$4 per thousand; on cigarettes weighing not more than three pounds per thousand, 75 cents per thousand, and on those weighing more than three pounds per thousand, \$4 per thousand. When the consideration of this bill to reduce internal-revenue taxation was begun in Committee of the Whole on the state of the Union, I gave notice of my intention to offer an amendment somewhat similar and having in view the same object, but I am willing to accept this. When the tax on manufactured tobacco was reduced from 24 to 16 cents per pound no corresponding reduction was made in that on cigars and cigarettes. I call the attention of this House to the fact that tobacco used in the manufacture of cigarettes is taxed 58½ cents per pound, whereas smoking tobacco of the same quality is taxed but 16 cents per pound. This unreasonable and unnecessary inequality is a direct discrimination against the labor employed in the manufacture of cigarettes, and the removal of it will enable those engaged in this business to enlarge their operations and give profitable employment to a much greater number of operatives. As it is, thousands of consumers buy tobacco taxed 16 cents per pound and make their own cigarettes.

This amendment has been offered in good faith, and is so reasonable as to commend itself to the support of all.

In this connection I desire to make some general observations in reference to this system of internal-revenue taxation. From the beginning of our national existence under the Constitution framed by our fathers down to the commencement of the war between the States our income was obtained chiefly from imposts and tonnage and from the sale of public lands. The revenue thus derived was found to be amply adequate for all the purposes of civil government, economically administered, and for the maintenance of our military and naval establishments. And regarding the condition of the country as revealed to us in official reports, I hesitate not to express the opinion that the Government of the United States can now be administered, including all legitimate and proper expenses, without aid from excise and stamp duties. If I am right in this position, then it is worse than a blunder, it is a crime to persist in taking annually from our industries \$150,000,000, as is being done. This has been properly characterized as "a plunder upon the people of the United States."

This method of raising revenue was resorted to, prior to our civil war, only on one or two occasions, when the exigencies of the public service seemed to require it, and was continued no longer than the necessity existed. Mr. Madison, in a speech delivered in the beginning of the first Congress, when addressing himself to the subject of a national revenue, said that "the system must be such a one that, while it secures the object of revenue, it shall not be oppressive to our constituents. Happy it is for us that such a system is within our power; for I apprehend that both these objects may be obtained from an impost on articles imported into the United States." Presidents Jefferson and Monroe, in messages to Congress

upon the same subject, made recommendations in harmony with this suggestion of Mr. Madison, declaring that sound principles do not justify the imposition of taxes upon the industries of our people. I might multiply quotations to the same effect from other distinguished writers and statesmen, who expended much thought upon the methods of taxation, but time will not permit and it is unnecessary. Thus it appears that this system is in opposition to our past policy and to the teachings of the fathers of the Republic. It was made necessary by the exigencies of our civil war, and was submitted to as a necessity, and because the public safety seemed to require it. We have a large surplus of income, and this must, year by year, increase, if the revenue laws remain unchanged.

The industries of this country have been staggering for years under the weight of onerous and oppressive taxation, and the time has arrived when there can and ought to be a considerable reduction. They are being plundered when there is no necessity for it, and the people will not endure it longer without a murmur. No more should be collected than is required for the legitimate and proper expenses of Government, and it is our duty to dispense with taxes when it may be done with perfect safety. For the fiscal year ended June 30, 1881, the ordinary revenue from all sources was, in round numbers, \$100,000,000 in excess of the total ordinary expenditures, including pensions and the interest on the public debt.

An overflowing and redundant Treasury, as shown by the legislation of this Congress, invites lavish expenditures and begets extravagance. We have been told by the honorable gentleman from Iowa [Mr. KASSON] in the course of this debate that we cannot now wipe out all of the internal-revenue taxes, and that we must maintain this system until we see the effect of the arrearages of pensions and various other acts of this Congress. I tell that honorable gentleman that many measures of legislation have received the sanction of this House which would never have been entertained if the necessity had existed for the practice of economy. The lavish appropriations made by this Congress for arrears of pensions and for other purposes are the legitimate results of the policy of refusing to lift from the shoulders of the people the burdens under which they are groaning; and if we shall continue to keep an overflowing Treasury our example will be followed by future Congresses, and then we shall have to wait longer to see the effect of other legislation in the same direction. The aggregate annual reduction in internal-revenue receipts proposed to be accomplished by this bill is about \$20,000,000. It is a step in the right direction, but it does not go far enough, and stops short of that measure of relief which the people have a right to expect and demand.

As the representative of a constituency largely interested in the production and manufacture of tobacco, I am not satisfied with it in its present form, though in favor of removing taxes from all the subjects embraced in it. I fear that the effect of this partial reduction will be to postpone, if not prevent, that relief for which my people are clamorous and which should be accorded as an act of justice to the Southern States of this Union. Tobacco is the only product of agriculture which is taxed in this country, and those engaged in its cultivation are subject to restrictions, burdens, and restraints from which other farmers are exempt. I have not the time to point out and expose all the hardships of this iniquitous internal-revenue system. I will not stop to denounce its iniquities and injustice, nor to speak of the annoyances incident to keeping the people surrounded with an army of spies and informers. It is enough for me that it is admitted to be an unnecessary restraint upon production and trade.

The honorable gentleman from Pennsylvania [Mr. KELLEY] has drawn such a faithful picture of the condition of the growers of tobacco under this system that I must not omit it. In an address before the national tariff convention, after giving many illustrations of the wrongs of this system and showing its influence in the creation of monopolies, he said:

The case of the owner of a small piece of ground devoted to tobacco-growing is scarcely less painful and must invest the moonshiner with his sympathy. Under the provisions of the law he may not sell an ounce of his crop to his neighbor, nor to any citizen who is not a licensed dealer in leaf tobacco. There are many thousands of these people for whose small crop there would be a ready market in the neighborhood, whose entire production is too small to pay for its transportation to a distant center of trade, or even to invite visits from traveling purchasing agents. These poor men must therefore barter their crop at the neighboring store at such prices as the single customer will offer, and for such goods as he is prepared to give in exchange. I may not extend these illustrations, but in conclusion would repeat that justice to the South requires the earliest possible repeal of the entire system of internal taxes.

Justice to the South requires their repeal; and yet the honorable gentleman, obeying the edict of his Republican caucus, stands to-day in opposition to their removal and the relief of that section. He votes to continue burdens which he has denounced as unwise, unequal, and unnecessary. It may be true that restrictions upon the producers of tobacco are necessary so long as the system shall be continued, but for that reason, if for no other, I am opposed to this method of taxation, and in favor of its extirpation, root and branch, as speedily as possible. Those engaged in the manufacture of tobacco are not opposed to granting relief to the producers of it. They only ask to be rid of the annoyances and disturbances to their business occasioned by the continual agitation for a reduction or repeal of the tax. They desire stability, and prefer that nothing shall be done until we are ready for a total repeal of all laws imposing taxes upon tobacco. I

take this occasion to say in their behalf that in any changes we may make in existing laws and regulations their interests should be regarded and consulted.

I am not unmindful of the fact that the manufacturers and dealers would be subjected to serious losses by sudden and violent changes, but such a result can and ought to be avoided by a provision that the repealing act shall take effect at some future day, sufficiently distant to enable them to accommodate themselves to the modified circumstances. And it should also contain a provision similar to that embodied in an amendment offered by the honorable gentleman from Pennsylvania, [Mr. RANDALL,] that "on all original unbroken packages of tobacco, snuff, cigars, cheroots, and cigarettes held by manufacturers or dealers, on the day fixed for the act to take effect, upon which the tax has been paid, there shall be allowed a rebate or drawback to the full amount of the tax."

In this way injury to them can be avoided, and they ask no more. I am satisfied that the receipts from duties on goods imported from foreign countries under a tariff adjusted on business principles, together with revenues derived from other sources, without the aid of internal-revenue taxation, will be amply sufficient for all legitimate and proper expenses. I am satisfied that that is the best and most acceptable method of taxation, and I am the more earnest in my advocacy of it because we can and will thus afford all needed protection to American industries, and while obtaining the necessary revenues for the purposes of Government we secure to our own citizens the home markets and encourage American labor.

Public Building at Shreveport, Louisiana.

SPEECH

OF

HON. NEWTON C. BLANCHARD,

OF LOUISIANA,

IN THE HOUSE OF REPRESENTATIVES,

Saturday, July 1, 1882.

The House having under consideration the bill (S. No. 750) to provide for the construction of a public building at the city of Shreveport, State of Louisiana—

Mr. BLANCHARD said:

Mr. SPEAKER: At the beginning of the present session of Congress I introduced a bill providing for an appropriation of \$150,000 for the erection of a public building in the city of Shreveport, Louisiana, commensurate with the necessities of the public business there. This bill was referred to the House Committee on Public Buildings and Grounds, which committee, as early as the 16th of February, unanimously reported it back favorably by substitute, and recommended its passage.

This substitute (H. R. No. 4462) is now upon the Calendar, and authorizes an appropriation of \$100,000 for the said building. Shortly after the bill was introduced in the House, my colleague in the Senate [Mr. JONAS, of Louisiana] introduced a similar bill in that body, which was appropriately referred, and likewise unanimously reported favorably on the 27th of March, with an amendment reducing the amount from \$150,000 to \$100,000, thus making it conform to the amount previously agreed on by the House Committee on Public Buildings and Grounds.

In the early part of April, Mr. JONAS, in the Senate, by unanimous consent, called up the bill for consideration and passage, and it passed the Senate without opposition. Ever since it came to the House as a Senate bill I have been watching for and seeking an opportunity to secure action upon it by the House, but have been unable to do so up to the present time.

It thus appears, Mr. Speaker, that the measure I am now discussing comes before the House under the sanction not only of the House Committee on Public Buildings and Grounds but likewise under the sanction of a similar committee of the Senate, and of the Senate itself. Nowhere has it met with any opposition, except that the original amount asked, \$150,000, has been reduced to \$100,000, and I trust its passage through the House in its present shape will not be opposed.

REASONS FOR ITS PASSAGE.

There is no public building in Louisiana, outside of the city of New Orleans, belonging to the General Government. Nor has there been an appropriation made by Congress for something like forty years for the erection of a public building in Louisiana. About forty years ago an appropriation was made to erect the present custom-house in New Orleans; and leaving out of view appropriations made from time to time for the repair, &c., of this custom-house, this is the only expenditure ever made by the Federal Government in Louisiana for public buildings for the accommodation of its customs business, its courts, its internal revenue, and other departments of business.

I do not lose sight of the fact that there is a United States mint in New Orleans, but that belongs to another and different class of buildings and departments of business.

The custom-house in New Orleans has long ago paid for itself over and over again, and thus it may be said the Federal Government is out of pocket nothing so far as public buildings in Louisiana are concerned.

From the breaking out of the war until about a year ago the circuit and district courts of the United States for Louisiana held sittings only at New Orleans for the entire State. In the Forty-sixth Congress, however, a bill was passed and became a law dividing the State into two judicial districts, the eastern and western districts.

Shreveport is the most important city in the western district, and is the home of the United States district judge and district attorney of that district. Indeed, Shreveport, next to New Orleans, is the largest and most important town in the State of Louisiana. It has a population of 10,000 inhabitants. It is at the head of low-water navigation on Red River. It is the shipping point by river, for a large scope of country, embracing parts of Louisiana, Texas, and Arkansas, and is the distributing point, in a commercial sense, of an extended section of country.

The receipts of cotton at Shreveport approximate 100,000 bales annually. Some years the receipts are over 100,000 bales; in other years under. The town is the center of a magnificent cotton-growing region, not excelled by any other in the world, and its prospects are considered first class. It is a live, progressive, prosperous, growing place. The manufacturing interests of the town are considerable and constantly growing. Recently a cotton-mill has been established there; and, besides this, there are three large cotton compresses, one large cotton-seed-oil mill, cotton-gin manufactory, foundry, large lumbering industries, a furniture factory, &c. Two daily and weekly newspapers are published in the town, a cotton exchange is there, and three banks are scarcely adequate to the transaction of its monetary matters.

Shreveport is the center or focus of several trunk lines of railroad, namely, the Texas and Pacific Railroad, the New Orleans Pacific Railroad, and the Vicksburg, Shreveport and Pacific Railroad. Of the first named of these roads Shreveport is the eastern terminus. The road extends from Shreveport westward to a point not far east of El Paso, where it connects with Huntington's California Southern Pacific Railroad, extending from San Francisco to a point east of El Paso. So that one can go from Shreveport via El Paso to San Francisco by rail. The New Orleans Pacific Railroad is a new road, recently constructed, and now in running order from Shreveport to New Orleans—the former city being the northwestern and the latter the southeastern terminus of the road.

The Vicksburg, Shreveport and Pacific Railroad extends from Vicksburg, its eastern terminus, to Shreveport, its western terminus. It is now all completed except a gap between Monroe, Louisiana, and Shreveport, which is partly graded, and under contract to be completed by December next. The bridge across the Ouachita River for this road is about completed, and the one to cross Red River at Shreveport is now under contract.

This Vicksburg, Shreveport and Pacific Railroad is part of the railway system owned and controlled by what is known as the "Erlanger Syndicate," extending from Cincinnati, over the Cincinnati Southern Railway, of which the Erlangers are lessees, to Chattanooga; thence to Vicksburg, over a road owned by the syndicate, and thence to Shreveport, over the Vicksburg, Shreveport and Pacific, likewise owned by the syndicate. Besides the railroads mentioned above as converging at Shreveport, other railroads are projected, so that the city bids fair to become a railroad center.

FEDERAL GOVERNMENT BUSINESS THERE.

Shreveport was some years ago made a port of delivery, and a customs officer is constantly stationed there. A marine hospital is established there; also a signal service or meteorological office. The United States courts hold sittings there. It is headquarters for an internal-revenue collecting district, embracing a number of parishes or counties. The yearly collections of revenue in this district are about \$30,000, as shown in the letter of the deputy collector to be found in the appendix hereto.

The post-office at Shreveport is a very important one, does a very large business, and pays the Government a large revenue, as shown by the statement furnished by the postmaster there, also to be found in the appendix.

It thus appears that there are six bureaus or departments of Government business located at Shreveport, five of which would be accommodated by the proposed public building, and the Government relieved from the payment of rent.

The Secretary of the Treasury reports that at present it costs the Government about \$1,800 a year for the rent of the buildings and offices used for the accommodation of the Government business. (See appendix.) This rent is likely to increase year by year, and just in proportion to the rapid growth and increased importance of the city; so that it would be a wise measure of economy for Congress to make the appropriation asked in the bill under consideration for the erection at this time of a public building there.

That this building is badly wanted, in order to afford adequate

accommodations to the transaction of the Government business there, is attested by the memorials to Congress of the city council and cotton exchange of Shreveport, praying the construction of the building. (See appendix.)

THE RED RIVER.

Besides its railroad system, Shreveport is situated directly on Red River, about five hundred miles from its mouth. It is the principal city of the Red River Valley. Both in point of length of navigation and commercial importance, the Red River is the fourth most important river in the United States, being exceeded only by the Mississippi, the Missouri, and the Ohio. It (the Red) is in seasons of high water navigable for fully five hundred miles above Shreveport, thus making its total navigable length over one thousand miles.

At a high stage of water boats ply regularly between Shreveport and Kiametia, in the Indian Territory, and the river is navigable some distance above Kiametia. It drains, in part, three great States, to wit, Louisiana, Texas, and Arkansas, and one Territory, namely, the Indian Territory. Seven or eight hundred miles of its navigable length is through an alluvial valley of wonderful and inexhaustible fertility, capable, when fully developed, of producing almost as much cotton as is now produced in all the South.

The upper part of this valley is, as heretofore stated, unsurpassed in all the world as a cotton-growing region, while the lower portion grows the sugar-cane in great luxuriance, at the same time growing cotton well-nigh equal to the upper regions of the valley. The whole of the valley grows corn in great profusion, besides many of the smaller grains, all the fruits and vegetables adapted to the temperate zone, and many indigenous to tropical climates.

The principal tributaries of the Red are Loggy Bayou, Lake Bistineau and the Dorchet, Cane River, Black River, Ouachita River, Little River, the Tensas, Bayous Boeuff, Macon, &c., the aggregate navigable length of which streams is fully equal to, if it does not exceed, the navigable length of the main channel of the Red, namely, one thousand miles, thus making a system of navigable water-way formed by the Red and its tributaries of more than two thousand miles in length, over which, as highways of commerce, are borne the rich products of as magnificent an agricultural country as this or any other land can boast.

This great river, Mr. Speaker, like all the rivers of the South flowing through alluvial formations, is troubled in seasons of low water with sand-bars and shoal places, rendering its navigation at once difficult, dangerous, and expensive. The Federal Government has in the past done a noble work in removing the rafts which for many miles completely choked the upper part of the river. It has, too, done good work in the removal of snags and sunken wrecks of boats from the channel.

But other than this, the river has received no successful treatment at the hands of the Government. The difficulties presented at each season of low water by the bars and shoal places have never been overcome, though steamboatmen have demonstrated a way to obviate the trouble, namely, by throwing up temporary jetties where they appear. These jetties confine the water and increase the velocity of the current over the bars, and in this way a channel through the bars is washed out.

The Government has never undertaken, as yet, work of this character on the river, for the reason that there has never been in the past any appropriation made for the general improvement of the river. The money heretofore appropriated has been for certain specified localities, to wit, the removal of the rafts, closing Tone's Bayou, the falls at Alexandria, and the mouth of the river.

The season of low water on the river usually lasts about five months of the year, in the late summer and early fall. The water gets so low on certain of the bars as sometimes to afford a depth of only fifteen and eighteen inches, and these bars practically suspend navigation during the extreme low-water season. On account of their existence, the freight tariffs by boats from New Orleans to Shreveport are oftentimes quadrupled—that is to say, a barrel of flour will be carried from New Orleans to Shreveport in high water at one-fourth the price that it will be carried for at an extreme low stage of water the succeeding fall.

Nor has the Government, either national or State, ever successfully encountered the problem presented by "the falls" of the river at Alexandria. What is called "the falls" are a series of rapids in the river, over a rocky formation, with very swift current, due to a fall of 2 feet 6 inches in a distance of 750 feet, equal to a fall of 18 feet 2 inches per mile.

In high water and at a moderate stage of water "the falls" are covered with water, and boats pass without serious trouble, though their passage is sometimes attended with danger. In low water, however, "the falls" sometimes bar entirely the passage of boats; and at other times boats lie there for days until literally pulled over with the hawser and steam capstan.

Various surveys of the falls have been from time to time ordered by Congress, and plans and estimates of expenditure for their improvement have been submitted by the Government engineers in charge of the surveys; but up to this time Congress has failed entirely to appropriate sufficient funds to remove this great obstruction to the navigation of the river.

During the late civil war, in the year 1864, General N. P. Banks commanded an expedition by land up the Red River Valley. A portion

of the Federal fleet, under Admiral Porter, co-operated with him by water, going up the Red River. The battle of Mansfield was fought forty-five miles south of Shreveport, resulting in disaster to the Federal forces, who began their retreat down and out of the valley. The fleet, which was keeping pace by water with the forces by land, also retired down the river until the falls at Alexandria were reached. Since their passage over the falls going up, the river had fallen, and on getting back to the falls on their retreat it was found there was not sufficient water to admit the passage of the gunboats and transports, and there was danger of capture by the confederates in pursuit.

In this dilemma an engineer connected with the fleet, by the name of Bailey, constructed a dam of rocks and earth in the nature of a jetty at the lower falls, just above the town of Alexandria, and on the opposite side of the river. This confined the waters and raised the river at that point sufficient to admit the passage of the fleet, and thus saved it. A portion of this dam still stands there, and the effect of it has been and is to throw the current of the river directly against the Alexandria side, causing the destruction of much valuable property on the upper front of that town. This destruction of property will continue unless measures are taken to protect the bank from erosion.

The following extract taken from the Louisiana Democrat, a newspaper published at Alexandria, in its issue of February 22, 1882, shows how great the damage has been resulting from this cause:

It strikes us as remarkably singular as well as unfortunate that there has never been any proper efforts made in past years by the various Representatives of this district in Congress to have means appropriated by the Government to build a breakwater somewhere above Alexandria to protect the river front of the town.

Within the last twenty-five years property of the value of at least \$100,000 has been destroyed by the constant caving away of the town front. This encroachment of the channel is still going on and the natural course of the current tends to strike the front of the town with increasing force.

An appropriation to protect the town against this danger is, I am glad to say, embodied in the river and harbor bill which passed the House at the present session.

For years past great trouble has been experienced at the mouth of Red River in seasons of low water. The Atchafalaya River, which takes its rise in Red River, (as an outlet,) about seven miles from where the Red empties into the Mississippi, has practically absorbed the Red, and threatens to completely divorce the Red from the Mississippi. This is because the Atchafalaya affords a shorter passage, with greater fall for the waters of the Red to the Gulf than the Mississippi does. The consequence of this diversion of the waters of the Red down the Atchafalaya is that between the head of Atchafalaya and the Mississippi (seven miles) in low water a bar forms, sometimes entirely closing all navigation through the mouth of the Red into the Mississippi.

In the summer of last year, (1881,) for a period of two or three weeks, this bar at the mouth of the Red prevented the ingress and egress of all boats to and from that river. This continued until the Government dredge-boats dredged out a channel from the Mississippi to the Atchafalaya. Before this channel was dredged, boats would bring Red River freights from New Orleans to the mouth of Red River, there disembark it, when it would be hauled overland about five or six miles to another boat in Red River, above the bar, where the freight would be embarked on this second boat for its destination up Red River.

I have mentioned these facts to call the attention of Congress to the great difficulties encountered in the low-water navigation of Red River—a river, as heretofore stated, navigable in high water more than 1,000 miles, and to the necessity for greater appropriations in future for the proper regulation and rectification of what is the fourth most important stream in the Union.

Surely, a river from which is shipped annually about 250,000 bales of cotton as the products of the country watered by it, and to which is shipped for consumption annually over 50,000 tons of general merchandise, is deserving of the fostering care of the National Government. The above figures are taken from the memorial of the cotton exchange at Shreveport to Congress, on the subject of river improvement, submitted to the House in February last by me, and which is to be found in the appendix to these remarks.

From the country watered by the tributaries of the Red River, which seek an outlet to that river through Black River, there is raised nearly as much cotton as is grown in the Red River Valley proper, and nearly as many tons of merchandise are shipped to that country as to the Red River country. So that the country watered by the Red and its tributaries may be said to produce annually between four hundred thousand and five hundred thousand bales of cotton, and to require for its annual consumption about one hundred thousand tons of general merchandise.

When we consider that this magnificent country is yet almost in the infancy of its development, we can form some idea of the possibilities offering there, and within easy reach of capital, enterprise, and energy.

Relative to the commercial importance of the Red River country, I make the following extracts from the annual report of the Chief of Engineers of the United States Army to the Secretary of War for the year 1881, Part II, pages 1403 to 1405:

Number of steamboats running to and from Shreveport are twenty; total tonnage of same, 64,630; value of annual imports, (estimated,) \$11,253,900; value of annual exports, (estimated,) \$5,537,600.

And in same book, on page 1406, I find the following:

Total value of cotton, cotton-seed, cattle, sugar, molasses, grain, hides, and sundries shipped down Red River to New Orleans from September 1, 1880, to July 1, 1881, \$9,885,000. Total number of tons of general merchandise shipped up Red River annually is 50,000, exceeding in value the down-stream shipments.

This was for the Red River country proper, and exclusive of the productions of the country watered by the tributaries of the Red, to wit, the Black, Ouachita, and Little Rivers and their confluents, and of the merchandise shipped to the latter region.

It will be thus seen that the value of the productions and of the commerce and trade of the Red River country is in the neighborhood of \$25,000,000 annually; and if to this be added the value of the productions and of the commerce and trade of the above-named tributaries of the Red, it will appear that the aggregate worth of the productions and of the commerce and trade of the country watered by the Red and its tributaries is not far short of \$50,000,000 annually.

This is, indeed, a grand showing, and is eloquent as an argument going to show that these rivers, all of which badly need improvement, should receive greater attention at the hands of Congress than has been accorded them in the past, or is accorded them in the river and harbor bill of this year.

BAYOU PIERRE.

A raft of about seven miles in length formed some years ago in Bayou Pierre, a navigable stream in Northwestern Louisiana. This bayou takes its rise near the city of Shreveport, and runs parallel with Red River on the west side for about one hundred and fifty miles, when it empties into Red River. It is fed mainly by Tone's Bayou, which empties into it from Red River at a point twenty-five miles below Shreveport.

Some years ago the Government made an appropriation for the removal of the great raft in Upper Red River, above Shreveport. The officials of the Government in the prosecution of this work did not pull the logs, drift-wood, and brush forming the great raft out of the river, but merely loosened them and permitted them to float down the current. These logs and brush went down Tone's Bayou and into Bayou Pierre and there lodged, forming a raft in that stream of many miles in length, which is constantly increasing.

Again, a few years ago, when an effort was made by the Government to close Tone's Bayou, to assist in the work chains and other fastenings were stretched across the bayou to catch the drift-wood floating down, and men were stationed on Red River, at the point where Tone's Bayou makes out of the river, to turn all the drift floating down the river down Tone's Bayou, in order to form a raft in that stream in aid of the works looking to the closing of the stream.

This went on until an immense raft had been formed in Tone's Bayou by the Government employés, which raft remained there for some months, and until a heavy rise of water swept it away along with the Government works, and carried the raft down into Bayou Pierre, where it lodged against the raft already formed there, as above described, increasing the length and extent of the raft in the said Bayou Pierre.

Not only is this raft obstructing a navigable stream but it is also resulting in the overflow nearly every year in seasons of high water of many thousands of acres of very valuable alluvial lands; and this overflow, from this cause, is becoming worse and worse every year.

Last year the back lands of many of the plantations on the river, between it and Bayou Pierre, were overflowed from this cause and much destruction of crops occasioned thereby. During the present year twice have these plantations been submerged, and their overflow is directly traceable to the existence of this raft in Bayou Pierre. So great is the trouble and damage it is causing that private letters received by me from planters in that section indicate that unless relief is extended by the removal of the raft that portion of the valley will have to be abandoned.

The raft acts as a dam in backing up the waters and preventing them from escaping down the channel of the bayou, and thus the submergence of the surrounding country is brought about.

The public sentiment of the State of Louisiana for its removal recently found expression in a memorial of the General Assembly, now in session, to Congress, asking an appropriation of \$100,000 to be used in clearing the stream of the raft. This appropriation is asked on the grounds—

First, that the raft closes entirely to navigation a navigable stream. Second, because it is the direct cause of destructive floods, at every stage of high water, over the adjacent country.

In 1878 Congress ordered a survey of Bayou Pierre, with the view to its improvement. This survey was made, and the report is to be found in the report of the Chief of Engineers of 1879. The engineers making the survey estimated it would cost at that time \$75,000 to remove the raft; but since then the raft has greatly enlarged, and it would now require about \$100,000 for its removal. Congress never acted on the report and estimates, and no appropriation was made.

It is of the utmost importance to that country that this raft be removed, and as the Government, through its employés, was instrumental in putting it there, it behooves the Government to remove it. I have brought this matter to the attention of the Commerce Committee of both the House and Senate, besides introducing the necessary bill, and indulge the hope that an appropriation will be made at least sufficient to begin the work.

APPENDIX.

No. 1.

Memorial of the board of trustees of the city of Shreveport, Louisiana, urging the construction of a public building at Shreveport, to serve as custom-house, court-house, post-office, signal-service and internal-revenue offices, &c.

To the Senate and House of Representatives of the United States in Congress assembled:

GENTLEMEN: The petition and memorial of the board of trustees of the city of Shreveport, a municipal corporation duly chartered and incorporated, located in the parish of Caddo, State of Louisiana, with respect beg leave to show that by acts of Congress it has been made a port of entry, being at the head of navigation on Red River. It is one of the seats of justice for holding sessions of the United States circuit and district courts for the northern district of Louisiana. That it is an extensive mail-distributing point, as also for the collection of internal revenue. That it is the eastern terminus of the Texas and Pacific Railroad; the northern terminus of the New Orleans Pacific Railroad; the western terminus of the Vicksburg, Shreveport and Pacific Railroad. That it has a United States signal-service station. That it is the prospective and designated crossing points for various other chartered railroads running north and south, and northeast and southwest. That at present it is the second city in the State of Louisiana in point of population and wealth, and is located in the midst of an extensive, populous, and productive territory that is growing more and more important every year. For the foregoing reasons and for many others that might be enumerated and fairly urged we respectfully ask that Congress make a sufficient appropriation of money for the purpose of erecting a building suitable to the accommodation of the United States circuit and district courts and officials, United States custom-house, bonded warehouse, signal service, mail service, internal-revenue service, and public-land office. Such a building is an absolute necessity, as the officials at present have to rent their accommodations in widely scattered localities and of a character greatly inadequate to the growing necessities, importance, and convenience of the public service.

Wherefore the council of the city of Shreveport respectfully ask for the appropriation of \$200,000 to be expended for the purposes prayed for.

We ask our Senators and Representatives in Congress to present this memorial and petition, and use every effort to obtain the necessary appropriation as speedily as possible.

Thus done, adopted, and signed at a regular meeting of the council of the city of Shreveport, and the seal of the city attached thereto, the 5th day of January, A. D. 1882.

ANDREW CURRIE, Mayor.

Attest:

W. J. BRUNER, Secretary of Council.

No. 2.

Memorial of Shreveport Cotton Exchange.

To the Senate and House of Representatives of the United States of America in Congress assembled:

We, the undersigned, citizens of Shreveport, Caddo Parish, Louisiana, and members of the Cotton Exchange of said city, do hereby present to your honorable body the following statement of facts, which we trust will win your favorable consideration of two bills introduced with your respective bodies by Senator JONAS, of this State, and Hon. N. C. BLANCHARD, representing this Congressional district, to wit: one asking an appropriation for the erection of a public building in the city of Shreveport and the other asking an appropriation for the improvement of the navigation of Red River. As regards the first, we beg to invite your attention to the fact that Shreveport, the second city in the State in population and commercial importance, is the distributing post-office for a large scope of country; that it is the headquarters in North Louisiana of the internal-revenue department of the State; that the United States district court holds its sessions here; that there is here a United States marine hospital, a signal-service office, and a collector of customs office.

Your petitioners respectfully represent that the cost to the Government for the payment of rent for the various buildings and offices necessary to accommodate the officials holding these various offices is no inconsiderable charge upon the Government, and moreover the accommodations are not commensurate with the greatness and wealth of the nation. We have had carefully prepared from the books of the Cotton Exchange by a committee appointed for the purpose the following report, which we submit as part of this memorial. It will be seen how large a sum of money is annually paid by the planting interest in excessive freights incident to a suspension of navigation. As regards the last-mentioned bill, asking for an appropriation for the Red River, we respectfully represent that Red River ranks among the most important streams in the Union. Its alluvial bottom embraces millions of acres of the finest cotton lands in the world, capable, if under cultivation, of producing nearly as much cotton as is now grown in all the South. It is susceptible of navigation for one thousand miles, and your petitioners believe that your honorable body will agree with them in the opinion that the appropriation asked is a very small one in comparison with the magnitude of the interest involved. In view of the facts here presented, we pray your honorable body to pass the bills herein mentioned, for which we ever pray, &c.

SHREVEPORT, LOUISIANA, January 27, 1882.

To the President and Board of Directors of the Shreveport Cotton Exchange:

GENTLEMEN: Your committee beg leave to submit to you the following report. Touching the matter of cotton moved from the banks of Red River, we beg leave to report as follows:

	Bales.
Amount of cotton delivered at New Orleans from Red River last season..	186,585
Estimated amount delivered at Fulton, Arkansas, to Iron Mountain road.	20,000
From banks at points within reach of navigation to railroads at various points.....	30,000
Total.....	236,585
Touching the matter of merchandise and freights:	
	Tons.
Shipped up Red River to Shreveport last season.....	81,800
Shipped by steamer above Shreveport same season.....	2,541
Shipped by steamer below Shreveport to plantations.....	21,200
Total.....	55,541

The rate of freight in high water to New Orleans from Shreveport, by river, fourth class, (per 100 pounds,) 20 cents; by rail, 72 cents. The rate of freight in low water from New Orleans, by river, fourth class, (per 100 pounds,) 62½ cents; by rail, 72 cents.

Average length of the high-water stage of navigation in Red River, five months. If proper improvements are made on the river it is thought by steamboatmen that freights can be carried at high-water rates the year round.

Cotton from Shreveport to the east, by river, during high water, (per 100 pounds,)

70 cents. None handled by river in low water. During high water, cotton east, from Shreveport, (per 100 pounds,) 65 cents; during high water, by rail, \$1.14. Cotton to New Orleans, by river, during high water, (per bale,) \$1.25; during low water, \$4; by rail, during low water, \$4.50.

Very respectfully,

J. BOISSEAU,
C. H. MENGE,
N. GREGG,
R. N. MCKELLER,
H. FLORSHEIM,
Committee of the Cotton Exchange.

At a special meeting of the cotton exchange, held on the 2d day of February, the above memorial and report of committee was submitted and unanimously adopted.

S. B. MCCUTCHEN,
President Shreveport Cotton Exchange.
JAS. V. NOLAN, *Secretary.*

UNITED STATES INTERNAL REVENUE,
DEPUTY COLLECTOR'S OFFICE, DISTRICT OF LOUISIANA,
Shreveport, Louisiana, January 28, 1882.

SIR: Yours of 17th instant at hand, and in answer thereto will make the following statements in the collection of internal revenue at this point:

The State of Louisiana composes one district, Hon. Morris Marks, collector, and subdivided into divisions, this being the eighth division of the Louisiana district, comprising the following parishes: Bienville, Bossier, Caddo, De Soto, Natchitoches, Red River, Sabine, and Webster, headquarters at Shreveport. The collections from this district for special taxes alone amount to about \$30,000 this year, ending April 30, 1882, the end of current year.

The United States district court for the western district of Louisiana convenes in Shreveport next month, and for the first term will have a respectable docket, consisting largely of violations of the internal-revenue laws. For the present, a building has been secured for the use of the court, it being the largest and most conveniently arranged for the purpose. Still there are not sufficient rooms for the officers of the court alone.

In addition to the United States district court there is a deputy collector of customs, for which an allowance of \$10 per month is made for rent, a post-office, and a Signal-Service office, which is allowed by the Government; but a United States commissioner's office and deputy collector of internal-revenue office, rents are paid by the respective officers from their individual funds, which is rather an unjust discrimination, but would be overcome by the establishment of a public building in the city.

There are many reasons beyond my official functions which would be of far more weight before a committee, which I have no doubt you have utilized, that would be beyond me to bring to your attention.

With best wishes for success, I am, respectfully,

WM. T. FLEMING.

Hon. N. C. BLANCHARD, Washington.

Statement of business transacted at the post-office at Shreveport, Louisiana, for the year ending December 31, 1881.

TREASURY DEPARTMENT, January 28, 1882.

SIR: In response to the request contained in your letter of the 25th instant, I have the honor to state that the following rents are paid for office accommodations for Federal officers at Shreveport, Louisiana, namely:

Post-office, per annum.	\$300 00
Signal office, per annum.	144 00
Customs office, per annum.	120 00
Marine Hospital Service, per annum.	180 00
United States courts, per annum.	1,000 00
	1,744 00

Internal revenue office—no allowance.

Very respectfully,

CHAS. J. FOLGER, *Secretary.*

Hon. N. C. BLANCHARD, M. C.,
House of Representatives.

Pensions.

SPEECH

OF

HON. COURTLAND C. MATSON,
OF INDIANA.

IN THE HOUSE OF REPRESENTATIVES,

Monday, June 19, 1882,

On the bill (H. R. No. 6514) making appropriations for the payment of invalid and other pensions for the fiscal year ending June 30, 1883, and for other purposes, upon a motion to suspend the rules and pass the same.

Mr. MATSON said:

Mr. SPEAKER: The consideration of this bill opens a wide field for discussion. It takes from the Treasury more money than has been taken by any single enactment since the period of the civil war. Notwithstanding that fact, I shall vote for it as cheerfully as I would have voted for any of the enormous appropriations that were made necessary to bring that war to a successful termination if I had then been a member of this body. When I cast my vote for this appropriation I am giving no charity, no gratuity, but I am simply voting to discharge an obligation that rests upon the people, as solemnly binding as any that was ever owed—the most sacred debt that was created by the war.

And, Mr. Speaker, it should be here observed that the manifest purpose of every member of this House to permit this bill to pass without any opposition or dispute, and under a suspension of the rules, is the clearest evidence of the fact that the pensions which this Government owes to its soldiers are safe in the hands of either of the great political parties of the country. And it gives particular emphasis to the fact that the ex-confederates who are here as the representatives of the people lately in rebellion against the Government are sincere in their declarations that they and the people they represent have accepted the results of the war with all its consequences.

An interesting statement was submitted by the honorable Commissioner of Pensions in response to a resolution of the Senate in April last, from which it is ascertained that at the end of the last fiscal year for the payment of pensions, to wit, September 4, 1881, there was at that time not a single county or parish in all of the United States that had not a pensioner. It is also ascertained that this large number of pensioners is by no means equally distributed among the different Congressional districts of the country. In fact, a very great disparity appears, the range being from twenty-seven in the third district of Georgia—the lowest number residing in any one district—to 2,930 in the first district of Kansas, the highest number residing in any one district at that time.

I discover that the district which I have the honor to represent had much more than an average number of pensioners, the number in each county thereof and the value of the pensions being as follows:

County.	Number of pensioners.	Annual value of pensions.	Annual payment, with arrears.
Bartholomew.	229	\$24,484	\$46,520
Brown.	75	8,020	15,238
Hendricks.	130	13,872	26,357
Johnson.	129	13,792	26,212
Monroe.	128	13,732	26,091
Morgan.	158	16,872	32,057
Owen.	162	17,368	32,999
Putnam.	194	20,828	39,573
Total.	1,205	128,972	245,047

The whole number of pensioners residing within the different Congressional districts of the United States was 248,234. The average number to each district was 813. It was to be expected that the localities that furnished the soldiers for the Union would now contain the great body of the pensioners, and so it happens. And I speak of this matter for the purpose of showing still more clearly the patriotic action of our friends from the South, who, without complaint, bear necessarily the greater burden of this large disbursement of money from the public Treasury, in that so small a portion of it is taken into their communities and invested among their people.

But, Mr. Speaker, although by this bill we appropriate an even hundred million dollars for the purpose of paying the pensions of the coming fiscal year, the appropriations of the succeeding year, and probably one other, must be even larger than this one. On the 1st day of November last there was still pending and unadjudicated

more than 227,000 claims which involved the payment of arrears, and of that number it may be safely assumed that 200,000 will still remain undecided at the end of the present fiscal year.

As the number upon the roll increases and as the claims involving arrears are adjudicated the amount necessary to pay both must increase. However, with all that taken into the account, there is no cause of alarm. We can materially reduce our revenues, both in the matter of customs and in the sum derived from internal taxation, so that the burdens resting upon the people will be greatly lightened, and still have money enough to pay the debt as it falls due, the interest thereon, the current ordinary expenses of the Government, and the most liberal pensions to the survivors of our wars. So I repeat that there is no good cause for any public alarm upon the question of the gross amount necessary to pay pensions. Nor do I assert that there is any such alarm among the people of this country. Some of the great newspapers have loudly declared against the law known as the arrears act, and some have gone so far as to demand its repeal.

I think it is safe to say here and now, Mr. Speaker, that that law will never be repealed. It is founded upon the principle of doing exact justice to those who are now entitled to share the bounty of the Government on account of the helplessness brought upon them in its military service. It has been so far executed that its repeal now would only create a new injustice to those who would be thus deprived of its benefits. No, sir; it will remain upon the statute-book and be fully executed until every dollar of this the most sacred debt growing out of the late war has been fully discharged and paid.

Some of the newspapers that have clamored loudest against this law have been heretofore most solicitous about the maintenance of the public credit, alleging and insisting that as a measure of protection in times of crisis and danger hereafter we must now pay all and even more than we owed. They forget that the repeal of this law, showing as it would upon the part of the Government an indifference to the just demands of those who were its willing defenders in the time of its greatest danger, would operate to weaken and probably destroy our only means of defense at such times—that defense which we can alone get from our volunteer citizen soldiers.

But it is urged that gigantic frauds have been practiced under this law. I deny it. I shall not assert that no frauds have been successful, but I do say that under the rules and regulations governing the Pension Office, as it is now administered, a fraud is well nigh impossible. I think, Mr. Speaker, that the one prolific source of mistake here is that we are apt to compare the pensioner whose disability is not visible with the one whose injury is open to the casual observer, and because we neither see nor feel his disability we conclude against him. These pensioners are all examined by competent surgeons or boards of surgeons, and the precise disability which he alleges and proves was incurred in the service must be found to be still existing, at least in its direct results. It ought to be remembered, too, that in the extremely active and hazardous operations of a four years' civil war, fought mainly by our volunteers, in a strange and to them unhealthy climate, the number of dangers and exposures was largely increased.

But, Mr. Speaker, there is cause, and just cause, for alarm upon the part of the people, not on account of the large expenditures each year for the payment of pensions, but because of the reckless expenditure of money in other directions. It was very recently stated upon the floor of this House by the distinguished gentleman from Tennessee, the former chairman of the Committee on Appropriations, [Mr. ATKINS,] that within a period of ten years, between 1870 and 1880, our list of civil officers in the employ of the General Government had nearly doubled; that in 1870 1.4 per cent. of the whole population held civil offices under the General Government, and in 1880 2.2 per cent. of the whole people were paid officers upon the civil list of the United States. And there is another matter to which I invite the attention of the House at this time, the increasing tendency to place civil officers and their dependents upon the pension list.

As a member of the Committee on Invalid Pensions, so studiously careful have I been to avoid taking a single step in that direction that I have felt compelled in many instances to oppose the report of a majority of that committee and again upon the floor of this House the granting of pensions to those who were even in the quasi military service, such as employes in the Quartermaster's and Paymaster's Departments, nurses, contract surgeons, and in another case the widow of a professor in the Naval Academy. Some of these cases were such as appealed strongly to my sympathy, but the rule by which I have been guided is that no pension should be considered or granted as a gratuity, but that the right to it is implied from the very contract of enlistment and from the laws in force at the time.

At this session this House has made considerable advances in the direction of the policy of the British Government relating to the pensioning of civil officers. This has been done, too, without providing, as England has, for very large reductions in salaries, that the Government might thus by its saving create a sort of life-insurance fund for the benefit of its officers. Already all the surviving widows of the ex-Presidents have been munificently pensioned; a bill has passed this House providing in effect, although not by its terms, for the pensioning of the employes of the Life-Saving Service; another is pending of a like character for the benefit of the employes of the railway mail service, and still another in behalf of the officers and men of the

revenue-marine service. If these bills become laws, how soon may we expect that all the officers of the Government will be demanding a like gratuity because of the precedents then so well established?

In the case of the military and naval pensions we can soon pay and discharge them; but when the policy of extending pensions to the officers of the civil list is once fairly begun, we have placed not only a heavy burden upon ourselves but we will entail upon our children even a heavier one, that it may require a revolution to shake off.

An estimate has been furnished to this House at its present session showing that if all the claims now pending involving arrears are paid, and all the surviving soldiers of the war with Mexico and the widows of the soldiers of that war are soon pensioned—a measure of justice already shamefully delayed—for the next twenty-five years the annual payment of the whole pension list will then only average about fifty millions of dollars, and after that time will necessarily be much less. So that it seems to be susceptible of easy demonstration that with an economical administration of the Government we can pay all our soldiers the pensions we so justly owe them.

But, upon the other hand, with a reckless extravagance in public expenditures this average sum of fifty millions per annum will become one of great burden to a complaining people, and the pensions that were cheerfully paid when we had a full Treasury will become unpopular, and in the necessity of the case might be reduced or even abandoned. And thus it is that this most deserving class of our citizens are doubly interested in the prudent and economical administration of our affairs.

I have but one criticism to offer upon this bill. It provides in the second section for some amendments to the law authorizing special examinations by clerks and agents of the pension department into the merits of pending and adjudicated claims. It fails to provide that these examinations shall be held only after due notice has been given the claimant or pensioner. I have already asked the honorable gentleman in charge of this bill [Mr. O'NEILL] to accept an amendment to that effect, but it seems that he has not been authorized by his committee so to do. And in the same connection it was stated by my colleague [General BROWNE] that such is now the universal practice of the Department. I replied then, and I repeat it here, that it ought to be not only the practice but the law, so that no claimant or pensioner could possibly be made the object of secret attack on account of any one's malice or prejudice.

I shall, however, Mr. Speaker, gladly vote for this bill, and hope to soon see that become a law which is so well indorsed as a practice; and I shall at the earliest date introduce a bill to that effect.

Internal-Revenue Taxation.

SPEECH

OF

HON. FETTER S. HOBLITZELL,

OF MARYLAND,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, June 27, 1882,

On the bill (H. R. No. 5538) to reduce internal-revenue taxation.

Mr. HOBLITZELL said:

Mr. SPEAKER: That portion of the internal-revenue system remaining upon the statute-books of the country comprises in part a policy of taxation sprung from the loins of the great war struggle of the States of the Union, and it found its justification in the magnitude and perilous necessity of that conflict. The Government was strained at every joint to maintain its full war power, and the people of the country cheerfully submitted to every demand made upon their purse and industry that the privilege of living and enjoying the fruits of their labor might be preserved to them and their children under an indissoluble union of indestructible States. But, Mr. Speaker, submission to this mode of taxation in an hour of danger and peril, while it illustrates in an eminent degree the patriotism of a free people, cannot be construed into an approval of that system as an ordinary means of providing revenues to meet the expenditures of Government. On the contrary, the history of our country is a standing protest against the continuance of such a system upon the body-politic after the emergency commanding it has passed away.

Sir, the excise system of taxation is the outgrowth of foreign soil, of monarchical absolutism. It is undemocratic, unrepugnant, and utterly repugnant to the spirit of our people and our free institutions. In England the imposition of such taxes was first made in the year 1643, having been extensively practiced in other portions of continental Europe before that period. In our country it was first used in 1791, just after the revolutionary struggle had ended and when our statesmen and public men were endeavoring to sustain the position of independence they had won as the rich fruits of a bloody revolution by laying and collecting sufficient revenues to meet the great expense of the war for liberty. The highest tax imposed upon distilled spirits under this policy was only 25 cents per gallon, and

yet the patriotism of our ancestors, just emerged from a long and bloody conflict that had been crowned with glorious success, was not proof against this call upon the spirit which had served them "in times that tried men's souls," and the country's history was blurred with the stain of a whisky insurrection in a neighboring State whose people were largely interested in the production of distilled spirits, in the very presence of their magnificent victory. These taxes, odious in their inception, grew more and more odious each year of their exaction until the inauguration of President Jefferson, under whose wise and beneficent administration the whole system was uprooted and abolished.

Again, Mr. Speaker, after the war of 1812, when another great and pressing necessity for revenues to enable the Government to meet the increased expenditures growing out of our conflict with Great Britain was upon us, a renewal of this system was recommended by our then President, James Madison, in aid of the revenues of the country, but it continued in force only a few years, being repealed in the year 1817 in obedience to the sentiment of public opinion, which crystallized the faith of the masses in the belief that the power of taxation should only be exercised in this form upon extraordinary occasions, and the occasion ended, the system itself should end with the necessity creating it.

Sir, the present internal-revenue system has operated oppressively upon the labor, industry, and business interests of the country for a period of twenty years, and to-day, notwithstanding the bounties to the soldiers of the war, the ample provision made for the payment of the public debt, and the great largesses scattered with bountiful hand in aid of commerce, internal improvements, and public buildings, the appalling fact stares us in the face that a surplus of more than a hundred millions of dollars—and still on the increase—lies dormant in the coffers of the public Treasury after the payment of most liberal and munificent expenditures for ordinary governmental purposes. And yet, Mr. Speaker, the odious system of revenue has its warm advocates upon this floor, representing a Republican majority, who refuse to relieve the famishing business of the country and take off the onerous burden of labor and industry that is weighing down the wealth and productive power of the people. Such a condition of things is unparalleled in the history of legislation, and if not criminal deserves the malediction of every honest man, capitalist and laborer, throughout the length and breadth of this great Union.

Sir, think of it. Think of it, freemen of America. More than a hundred millions of the wealth-producing power of the people, wrung from the sweat of labor, locked up in the vaults of the nation and absolutely paralyzed by the maintenance of this infamous policy of internal taxation! Do you wonder that capital is cautious, that the cost of living is alarmingly on the increase, and that labor is uneasy and refuses to work for unremunerative wages which are not adequate to the wants of their families? Where is it going to end, I ask, if the great car of Juggernaut is to move on at the bidding of King Caucus, reckless of the ruin and destruction of the national prosperity and the happiness of the people which marks the track of its iron wheels? Sir, the Republican majority of this House are responsible for the continuation of this pernicious policy; and the great voice of the American people at the ballot-box in November will put the seal of their condemnation upon that party who, in determining the legislative policy of the present Congress, gave them a stone when they asked for bread; and instead of conserving the wants and necessities of 50,000,000 people, instead of affording relief to the perishing strength of production and building up all that constitute the life and power of a great country, dictates through a party caucus the miserable measure included in the terms of the bill under consideration. It may be wisdom and statesmanship from a Republican stand-point to believe that the chief end of man is the distribution of the official loaves and fishes incident to government, but I admonish them that while Nero fiddles Rome is burning. Your prosperity is staggering under the burden of these merciless exactions, and the time and the hour foreshadow revolution and panic.

Mr. Speaker, the people with one voice have demanded relief from these excise taxes, and their collection is as unjust as they are unnecessary. The Democratic party here have honestly endeavored by proper amendments to this measure to secure the relief desired, but, sir, in vain have the people and their representatives appealed to the power and conscience of King Caucus. The fiat has gone forth, and while monopoly and money-power reap relief from their oppressive burdens, the honest labor and industry of the country must suffer still another season. I have voted for every amendment looking to a reduction of taxation, and I am ready to vote for the entire repeal of the internal-revenue system, excepting alone the collection of a fair tax upon distilled spirits, offering as it will an opportunity in a proper revision of the tariff to relieve the consumer substantially by the reduced cost of articles of necessity without impairing the revenue to be collected, and permitting also the withdrawal of alcohol from bond free from tax when used in the arts and for chemical and other purposes, as provided in the amendment offered by the gentleman from Kentucky, [Mr. WILLIS.] I will vote for this bill as the only relief permitted by the Republican majority of this House, but, Mr. Speaker, in the name of my constituents I enter a solemn protest against the action of that majority in their denial of that full and ample reduction of taxation which the people command and are entitled to receive at the hands of their representatives.

Internal-Revenue Taxation.

SPEECH

OF

HON. WALDO HUTCHINS,

OF NEW YORK.

IN THE HOUSE OF REPRESENTATIVES,

Thursday, June 22, 1882.

The House being in Committee of the Whole on the state of the Union, and having under consideration the bill (H. R. No. 5538) to reduce internal-revenue taxation—

Mr. HUTCHINS said:

Mr. CHAIRMAN: I had not proposed to take part in this debate, and should not have done so except for some observations that dropped from the gentleman from Kentucky [Mr. THOMPSON] who addressed the committee yesterday. I will say, Mr. Chairman, speaking for myself, that I shall vote for the bill now under consideration. I shall vote for it, not because it is all I could wish it to be, nor because it by any means meets fully the wants and necessities of the hour.

The people of this country, if ever in its history they needed relief from oppressive taxation, need it to-day. The most casual observer of the signs of the times cannot but see that there is something wrong in the business affairs of the country, and it can easily be discerned what that difficulty is.

Awakening from the long lethargy following the depression of 1873, our national industry, like an aroused giant, again resumed its task of ministering not only to the wants of the fifty million of our own citizens, but to those of the whole world. We have made enormous strides in the last few years. We have exported millions of bushels of wheat, we have built thousands of miles of railroad, but our giant is beginning to stagger in his onward march. He has too heavy a load to carry. Hercules himself could never have performed his fabulous labors had he been hampered with such a load as now bears down the industry of our nation.

What are we to understand by the uprising of the people, the so-called "strikes" and the "labor troubles" that have shown themselves under such terrible aspects during the past few years? Do not these disturbances grow out of a policy fostered and made powerful by Congressional legislation? Is there not a great wrong existing somewhere which human forecast can discern and which can plainly be traced to this Capitol? It seems plain to me that the tariff and internal revenue are the guilty causes of these convulsions in the body-politic. The terrible burden which the laboring classes are compelled to carry by reason of the outrageous imposts upon all they eat and all they drink is the palpable cause of these violent agitations. With us the question to be answered is, how can this burden be removed?

To-day we are collecting by taxes from the people of the country each year \$100,000,000 more than the necessities of the Government call for, and it is proposed by this bill to reduce taxes to the extent of only \$17,000,000. Some measure should have been perfected and introduced into this House early in the session which would have relieved the people of more than \$60,000,000 of taxes annually, and it should have been done with favorable consideration to the business interests of the country. This bill seems to me to be a mere makeshift, a peace-offering to the suffering people, an endeavor to satisfy them by removing a small part of the heavy load which they are now compelled to carry.

Mr. Chairman, I am compelled to say that I contemplate the situation of things as I find them here in Congress with amazement. How it is possible for the representatives of fifty millions of free, enlightened, thinking people to meet here for the solemn purposes of legislation, avowedly for the benefit of the people, and yet, by artful processes, evade the consideration of vital questions upon which real prosperity depends, is more than I can understand. Certainly it is not ignorance that produces this state of things, for these gentlemen are among the most enlightened and cultured in the land. They have come up here from the bench, the bar, the learned professions, the factory, and the farm professedly to represent and to act for the best good of the people, but they certainly do not faithfully represent the interests and wishes of those who send them here, for a large majority of the masses of the population East, West, North, and South desire relief from the oppressive tariff burdens which weigh them down. The "mobs," the "strikers," and the suffering laborers everywhere convey to every thinking person the logic of this fact. I am therefore forced to the conclusion that the majority of this House come here as the representatives of a political party rather than of the people whose servants they are.

We must, however, accept the situation as it is. While I wish we could have had at this session a modification of the tariff; while I regret that the House has voted that it is incapable of properly considering the subject, and therefore it has deputed that duty to others for them to accomplish the object; while I regret that the House through its proper committee did not do that work itself, but

inasmuch as we have seen fit to throw the work off our own shoulders we can expect no relief from any quarter during this session, I shall therefore support this measure as the only thing that can be done under the circumstances.

I have been surprised at the remarks which have been made on this question by gentlemen; at their allegations that it is not Democratic doctrine to remove from the shoulders of the people the burden of internal-revenue taxation. Such statements seem strange to me, in looking over the history of the past and considering the action of the Democratic party since its organization, that any gentleman on this side of the House can say that it ever was Democratic doctrine to impose internal-revenue taxes upon the people except as a war measure. I claim it is the most undemocratic system of taxation ever devised. It was adopted as a war necessity only, and it can only be upheld as such. It has no more place in our civil polity, now that the war has been ended seventeen years, than would a standing army of 500,000 men in times of peace.

In 1789, in the first Congress that was held after the adoption of the Federal Constitution, Mr. Madison, immediately after it convened, introduced a measure providing for revenue for the support of the Government. He said:

The deficiency in our Treasury has been too notorious to make it necessary for me to animadvert upon that subject. Let us content ourselves with endeavoring to remedy the evil. To do this a national revenue must be obtained, but the system must be such a one that while it secures the object of revenue it shall not be oppressive to our constituents. Happy it is for us that such a system is within our power, for I apprehend that both these objects may be obtained from an impost on articles imported into the United States.

Mr. Madison strenuously opposed the adoption of the excise law, imposing internal-revenue taxes. We know what the effect of that law was; history informs us of the Shay rebellion and other armed demonstrations against its enforcement.

President Jefferson in his first annual message to Congress recommended the repeal of the law passed by the First Congress providing for the collection of internal-revenue taxes. In his message he says:

The augmentation of population combined with other circumstances had produced an augmentation of revenue which justified the repeal of all internal taxes. The remaining sources of revenue will be sufficient to provide for the support of the Government, to pay the interest on the public debt, and to discharge the principal in shorter periods than the laws or the general expectation had contemplated. War, indeed, and untoward events may change the prospect of things and call for expenses which the imports cannot meet; but sound principles will not justify our taxing the industry of our Federal citizens to accumulate treasure for war, to happen we know not when, and which might not perhaps happen but for the temptations offered by that measure.

Following the recommendation made by Jefferson, Congress, ten years after its enactment, repealed the first law which authorized the collection of internal taxes.

Again, in 1813, owing to the necessities growing out of the war of 1812, President Madison summoned Congress in an extra session, and recommended the adoption of an internal-revenue law as a war measure, which law was passed and remained in force until President Monroe, in his first message, recommended to Congress its repeal; and it was repealed.

Thus we have the recommendations of Madison, Jefferson, and Monroe, the fathers of the Democratic party, all upon record against an internal-revenue system of taxation, except as a war measure.

But I will come down to later times, to the year 1868, and look to the Democratic platform of that year to see what was said in it in relation to this internal-revenue tax system. That platform demanded—

The simplification of the system and the discontinuance of inquisitorial modes of raising and collecting internal revenue, so that burdens of taxation may be equalized and lessened, the credit of the Government increased, and the currency made good.

My friend from Kentucky [Mr. THOMPSON] yesterday stumbled a great deal at the word "inquisitorial," not being able to understand what was meant by that word when used by the chairman of the Committee on Ways and Means [Mr. KELLEY] in presenting his reason for the adoption of the bill under consideration. But here we find it in the Democratic platform of 1868. It is a word taken from that platform by the gentleman from Pennsylvania, and is good, sound Democratic doctrine, that this "inquisitorial" mode of raising and collecting revenue should be broken up and destroyed.

And here let me call attention to the Democratic doctrine on the tariff, as laid down in the platform of the convention of the Democratic party held in 1868, to which I adhere to this day, upon which I stand, and upon which I believe in a fair contest the majority of the people of this country will stand:

A tariff for revenue upon foreign imports, and such equal taxation under the internal-revenue laws as will afford incidental protection to domestic manufactures, and will, without impairing the revenue, impose the least burden upon, and best promote and encourage the industrial interests of the country.

I stand upon that platform to-day, and, fortified by the precedents which I have cited, I advocate the passage of this bill; not because it is the best measure that could be presented, but because it is the only one that the committee has reported for our consideration looking toward any relief from the burdens that are oppressing us.

I cannot feel it my duty to adopt the policy advocated by my friend who spoke yesterday. The Republican party demands that the tariff shall remain as it is; that no reduction in it be made. Speaking for this side, the gentleman claims it as Democratic doctrine

that the internal-revenue taxes shall not be touched; but shall remain as they are. So we shall be confronted with this condition regarding the collection of revenue for the support of the Government—the Republican party adhering to the present tariff with all its absurdities, and the Democratic party committed to the internal-revenue system and refusing to consent to any modification thereof unless the Republican party will consent to a reduction of tariff duties. This is not statesmanship. It is not the proper thing to do. We are to examine every measure coming before us, and if we find it is right, no matter if it be not just what we like, if it is right and will relieve any portion of the people of unjust burdens, it is our duty to adopt it.

One word, Mr. Chairman, as to this bill and what it proposes to effect. It removes the stamp tax from bank checks. I am told this tax ought not to be taken off. Well, it is a small tax; but it is one that bears as heavily upon the poor as any other tax that is imposed upon the people. No depositor in a savings-bank can draw out twenty-five cents without putting a two-cent stamp upon the check or order. I have seen a poor woman go to the counter of a savings-bank to draw out less than twenty cents, and she has had to pay one-tenth of the amount drawn out for a two-cent stamp to put on the order before she could draw the money. Now, while the capitalist, the business man, and every one who makes a check is compelled to put a stamp upon it, he can draw out of the bank one thousand or a hundred thousand dollars for the same tax that the poor woman had to pay on her savings-bank order of twenty cents. Thus the burden of this inequality, like most of the burdens of taxation, falls heaviest upon those least able to pay. This is comparatively a small matter; but none the less should we dispose of it and get it out of the way. It is a relic of the war, and I want to brush it aside and put it out of sight.

It is proposed also to remove the tax upon deposits of money, and I am told that this is in the interest of the bankers alone, and so "should be rejected." Why, sir, the great need of the South, the Southwest, and the West to-day is bankers. It is money, the instrument of trade, that they need, without which it cannot be carried on as business is transacted in this age of civilization. Money should be free as air; no tax of any kind or description should be levied upon it except as a war necessity, because in the end such a tax is paid by the poor man, who is compelled to borrow money, and at the last labor pays it. Every man who has worked out this problem and seen its practical operation knows that what I say is true, and that when we pass this bill, relieving deposits from taxation, we reduce to that extent the burdens of the entire community.

No one can object to the abolition of the tax on matches and the other articles enumerated, medicines, &c., in the bill under consideration. We can vote for these reductions, and thus make a beginning in wiping out these taxes which are obnoxious to the people; which assist in continuing a system that ought to be blotted out, but which never will be, unless we make a beginning toward its accomplishment.

But, Mr. Chairman, it is said that this bill is proposed merely for the purpose of preventing a reduction of tariff duties. I cannot think this is so; but granting it to be the fact, still these taxes ought to be abolished, even if that were the tendency of this measure. I had hoped, and I hope now, that the Committee on Ways and Means will look further into this matter, and see whether they cannot afford the people some other relief in addition to that offered by this bill, so that the Republican party may not be charged with taking the taxes off money in the interest of capital and leaving labor with all its burdens still upon it. Of course, that charge under the present circumstances might well be made; because the people can well say, "If the Committee on Ways and Means could prepare a bill to amend the internal-revenue laws they certainly could have prepared a measure to relieve the country from some portion of the tariff duties."

I will make one suggestion to the committee. Why should not the duty which was imposed on sugar in 1875 of 25 per cent. in addition to the duty which then existed be abolished? The amount we are collecting for duties on sugar each year is about \$50,000,000. This sum is about one-quarter of the entire revenue realized from imports; and sugar is not regarded as a luxury, but has become an article of prime necessity. Suppose we abolish this duty of 25 per cent., which at the time it was imposed was especially designed to protect the sinking fund and provide for the exigencies of the Government. It was a temporary measure and so conceded to be when it was passed. Now, if this law be repealed it would reduce the revenue about \$11,000,000, and leave about \$40,000,000 collected upon sugar alone. Think of it! Every person who now buys a dollar's worth of sugar pays 30 cents of that dollar into the Government Treasury! This is not right. There is not a member of this House who will say that it is right. The Committee on Ways and Means could at once report a bill repealing the law of 1875, and I believe it would be passed by this House by a nearly unanimous vote, and thus the people be relieved of about \$11,000,000 of taxes.

I had hoped, Mr. Chairman, this Congress would have employed itself in meeting and disposing of some of those financial questions so essential to the prosperity of the whole people. I had hoped, sir, we might have done something effectual toward re-establishing our former prestige upon the ocean as a commercial power. I had

hoped, sir, that the fruits of our legislation would have made it practicable for our merchants to buy ships wherever they could be bought the cheapest, and that by this means we might enter again upon a carrying trade on the ocean which would revive at once our mercantile marine and quicken every enterprise dependent upon capital and labor. But I am obliged to conclude from the studied resistance which meets every attempt in the interest of such needed and wholesome legislation that nothing salutary in this direction will be done by this Congress. No one thing would so effectually benefit the prosperity of the whole country as the removal of all legal restraints to the buying our ships in any part of the world. It would restore the link in that chain of circumstances which connects capital and enterprise together and sets them to work earnestly for grand results. No enemy of American institutions could have devised a scheme more disastrous to our commercial interests than the present tariff in this regard, and no act of legislation would sooner be felt in all the arteries of commerce and trade than its repeal. There is not a gentleman present who does not fully concede the force of this statement and believe in its truth.

Mr. Speaker, the discussion of the tariff question in its length and breadth, in its present and future bearings, in my judgment, should develop broader views and higher considerations than is shown by the representatives of the Republican party in this House. The changed condition of things produced by the marvelous improvements of the age, brought about by the application of steam and electricity, do not seem to be entertained in the narrow and selfish policy of the present tariff. Time and space have been annihilated and every part of the business world has been brought together. The time is approaching when we shall be compelled to consider the fact that the true interest of one country cannot be best served by proscription and the restriction of trade. We have got to face this great question sooner or later and discuss it upon high ground, and why not do so now in the spirit of wise statesmanship? The policy that should be adopted by a great nation like ours calls for breadth of mind, forecast, and mature judgment.

The tariff should be so modified that we might build up trade outside of this country. The time when we can do this must come, and speedily, or we shall find ourselves in great financial embarrassment. Look at the labor strikes to-day. What do they mean? Overproduction. Why overproduction? Because it costs so much to produce manufactured articles in this country. We cannot compete with England in the sale of such articles in the markets of the world. That difficulty must be remedied, and the sooner the better. If we watch England in her course, and if our agricultural friends of the West are watching her to-day they will find that England by her policy in two years will be able to supply herself with wheat cultivated by the pauper labor of India, which will thus come in competition with the free labor of our own country. They have completed in India a canal which will irrigate a territory as large as the State of Illinois, embracing as fine wheat land as there is in the world. We shall have to meet that competition, and in order to be able to meet it we should put our tariff on such a footing that we may be able to manufacture so as to compete in the markets of the world.

In some articles we are now competing with the product of other countries. We have companies organized in this country producing agricultural implements which find their chief market abroad. We should so modify our laws, so simplify them as to look in that direction to enable us not only to keep our home trade but to compete successfully in foreign markets.

Mr. Chairman, I desire to call attention to one or two offensive features in this internal-revenue system, which aggravates and annoys our people, while it imposes its grievous burdens. I refer to it as a system of espionage.

What is the internal-revenue system but a grand scheme for drawing out all the details and the internal working of the private affairs of individuals and the secrets of every man's business? Does it not allow, under the forms of law, the agent of the Government to enter the private office of the citizen and examine his books and papers? Does it not allow him to enter the factory, the workshop, the bank, and every place of business for the same purpose? It is, Mr. Chairman, a system of espionage that is at war with every principle of civil liberty, and in a less enlightened age would have provoked armed resistance and bloodshed.

This internal-revenue system is the handmaid of centralization, and centralization is the most dangerous enemy to our institutions. The Commissioner of Internal Revenue is an autocrat, a royal arbiter in the business affairs of the whole country. His influence is the most potent of any known force in our Government. He can discover and make use of the secret springs of industrial enterprises, and may use this valuable knowledge in the interest of individuals or combinations with wonderful effect. No system should be tolerated in our Government granting such functions to an individual; and as soon as practicable this immense one-man power should be destroyed and business be allowed to proceed in those natural channels which skill and enlightened enterprise employ for the individual and public good. As war measures to save and perpetuate the Government the people of this country were willing to make almost any surrender of minor principles. They were willing to give up privileges and rights dear and precious to them, in order to preserve the unity of the country. The Anglo-Saxon idea that every man's house

is his castle—this grand idea upon which is predicated the whole fabric of civil liberty and individual independence—is ruthlessly violated and repudiated by our internal-revenue system. Indeed, our people have shown great patience in submitting to this offensive war measure so long in times of profound peace and general prosperity. My best judgment tells me to begin now and here the work of destroying the power of this centralizing agency. While I would be glad to see the entire system wiped out, root and branch, at once, I shall nevertheless vote for this bill as an entering wedge to the accomplishment of that purpose.

I yield ten minutes of my time to the gentleman from Vermont, [Mr. TYLER.]

Collectors of Internal revenue.

SPEECH

OF

HON. THOMAS M. BAYNE,
OF PENNSYLVANIA,

IN THE HOUSE OF REPRESENTATIVES,

Monday, June 19, 1882.

The House having under consideration the bill (H. R. No. 2415) to fix the term of office of collectors of internal revenue—

Mr. BAYNE said:

Mr. SPEAKER: The object of this bill is not to promote the public service, but to promote political purposes. Until within a very short time it has never been a cause of complaint that officials who discharge their duties faithfully and well should have a limit put upon the tenure of their offices; and no such law has been demanded until within a comparatively recent period, and as I must think and believe, for no other purpose in the world than to promote not the good of the service but purely political objects.

The condition of the internal-revenue service of this country, with regard to its management and with regard to the official integrity of those having it in charge, has been a most unexceptionable and a most exemplary part of the public service. Almost the entire force of the internal-revenue collectors in this country have held their positions for a great many years. Nearly every one of them who held his position until a very recent period was an appointee of President Grant. President Hayes observing, so far as he possibly could, a sound civil-service policy, refused to remove the faithful and competent collectors of the internal revenue, and during his entire term of office but few, if any, of them were removed. Now, for the first time, we have an appeal made to Congress to limit and fix the tenure of these offices, and for what reason? Why, sir, the reason given in the report of the committee is to prevent controversy about the positions and to have the officers secure in their places. But who ever dreamed that these officers were not entirely secure in their positions until the incoming of the present Administration and its policy of proscription? Their positions and their tenure were regarded as secure until this time.

The complaint is made and comes from many quarters, from political quarters and for political reasons only, "Oh, these men have held their positions for ten years, and for twelve years, and for fourteen years, and for sixteen years, and therefore they should be removed." But, sir, that is the argument of the politician. Why, sir, the purpose of this bill contravenes the progress of the times and the meaning of sound civil service. The purpose of this bill is to enable the Administration to relieve itself of the embarrassment of removing competent officers at the solicitation of political spoilsmen and those who are to use those offices to promote their personal, political ends. The Administration has encountered embarrassment in the removal of competent and faithful officers. It has met with opposition from the people. It has met with protests that have gone in signed by thousands upon thousands of the people of the various districts because faithful and good officers were removed. And for what reason? The people understood the reason. It was to put in power and place political henchmen that they might serve the powers that be and the powers that control this Administration through a kitchen cabinet.

Now, sir, will a Republican committee of the House of Representatives propose a bill that will relieve the Administration from this embarrassment of removing faithful officers, and enable it to put these political henchmen in for the purpose of promoting the personal and political ends of a faction of the Republican party? Why, sir, the power now resides in the Executive, as has been shown within the last few weeks by frequent occurrences, of removing every one of these internal-revenue collectors. In my opinion, the exercise of that power by the Executive is a violation of the Constitution and a violation of the laws of Congress. Yet, sir, that power is being exercised now, and faithful and competent officers are being removed day after day.

Why, sir, is there a necessity for this bill? Who is calling for this

bill? What demand has been presented to Congress for such a bill? Who petitioned for it? Who asked for it? The room of the Committee on Ways and Means is flooded with petitions for measures that have not been called to the attention of Congress and reported for its action. Show me a single petition in favor of the passage of that bill. What single citizen of the country came here and asked for it? I do not doubt that there are persons who asked for it, but I unhesitatingly say that the men who asked for it did so for purely political reasons and never for one single moment had an idea of promoting the public service of the country. Why, sir, this question of retaining faithful and competent officers is challenging the attention of the best intellects and the best sentiment of the republic to-day. There is no great moral, political question that is challenging so much attention. There never came up from any country on the face of the earth—except England, and there the purpose is accomplished—a stronger demand upon the Representatives of the people to fix and secure a certain tenure for the civil service of the Government, that the public service might be attended to, that faithfulness and that diligence and that honesty with which private business is attended to by competent and faithful employes.

And now, sir, when we have a class of officers whose conduct is unexceptionable—for no part of the whole service of the Government has been more faithfully and honestly and efficiently conducted than the Internal Revenue Department—when we have a class of faithful and efficient officers in these positions, educated to fulfill their duties, experienced and trustworthy, in comes a bill from the Committee on Ways and Means to enable the Executive to thrust these officers out and to put in the political henchmen of the politicians who want to promote their own re-election to the Senate and House of Representatives and other positions within the gift of the Legislatures and the gift of the people.

Mr. VALENTINE. The gentleman must have got hurt; he must have got winged recently from the way he flutters.

Mr. BAYNE. The people have got hurt, and the Administration will get hurt, too, before it finishes its course.

Mr. DE MOTTE. You have stated here that this is to relieve the Administration from embarrassments; are you authorized to state that this is asked for by the Administration?

Mr. BAYNE. God forbid that I should be considered the mouth-piece of this Administration; I leave that to others. I will ask the gentleman in reply, do you, sir, approve the course of this Administration?

Mr. DE MOTTE. I do; yes. [Applause.]

Several MEMBERS. So do we!

Mr. BAYNE. Yes; there are a few gentlemen here who do.

Mr. HUMPHREY. "The woods are full of them."

Mr. BAYNE. I think you would have to go to the woods to find them.

Mr. HUMPHREY. And the Pennsylvania woods at that. [Laughter.]

Internal-Revenue Bill.

SPEECH

OF

HON. ROBT. B. VANCE,

OF NORTH CAROLINA.

IN THE HOUSE OF REPRESENTATIVES,

Monday, June 26, 1882,

On the bill (H. R. No. 5538) to reduce internal-revenue taxation.

Mr. VANCE moved the following amendment:

Amend after section 3: "Provided, That the money raised under the provisions of this bill shall be turned over to the States of this Union for the purpose of educating the people in the common schools on the basis of illiteracy, as shown by the census of 1880."

Mr. KELLEY. I make the point of order that the amendment does not relate to the subject-matter of the bill.

Mr. TOWNSHEND, of Illinois. I ask the gentleman from Pennsylvania to yield to a motion to rise.

Mr. VANCE. I suppose the gentleman from Pennsylvania referred to section 7 of Rule XIV. I submit the question to the Chair.

The CHAIRMAN. The Chair thinks this amendment does not relate to the same subject as the bill. This relates to an expenditure of money for school purposes, while the bill relates to another subject.

Mr. VANCE. Mr. Chairman, the resources of our country are so great that, after paying all its expenses, including a vast sum in pensions to the soldiers of our various wars, we are interested in the statement that there is a surplus of \$150,000,000 in the United States Treasury. Why this surplus should be there is a strange problem. We yet owe a national debt of two thousand millions. It is asserted that the national banks, holding the bonds of the United States, do not wish

to surrender them, and hence the money is not paid out for redeeming the bonds. Now, let us look at the situation. The people are taxed on salt, sugar, coal, blankets, tobacco, spirits, &c., to raise this immense sum. Repeated efforts have been made in the House by those favoring a reduction of taxes to get the taxes off such articles as are enumerated above. The majority in the House has even refused to take the taxes off leaf-tobacco, off the raw material, so that the farmer could sell in the leaf wherever he chose and could find a purchaser. General DIBRELL, of Tennessee, and Mr. HATCH, of Missouri, have both offered bills, and brought the House to vote upon them, in the interest of tobacco raisers, and in each instance without success.

On the 6th of June, 1882, Mr. TURNER, of Kentucky, moved to suspend the rules and pass the following bill, with the result set forth:

TRACE-CHAINS.

June 6, 1882.

A bill to abolish the duty on trace-chains.

Be it enacted, &c. That the duty on trace-chains is hereby abolished, and from and after the passage of this act no duty shall be collected on importations of trace-chains, and they shall be placed upon the free list. And all laws and parts of laws inconsistent herewith are hereby repealed.

The question was taken; and there were—yeas 73, nays 109, not voting 109; as follows:

YEAS—73.

Thus it will be seen that the majority refused to remove the tax from trace-chains, an article used by every farmer. Bills were introduced to repeal the internal taxes, to repeal the duty on salt, &c., and others to reduce the tax on manufactured tobacco, spirits, &c.

The Committee on Ways and Means has steadily and persistently refused to report a bill to take the taxes off the products of the farmer, and finally reported the bill referred to and read in the beginning of my remarks on 24th June. It will be seen that the bill frees bank capital, bank deposits, matches, bank checks, patent medicines and perfumery from taxation, and reduces the taxes on licenses, cigars, and cigarettes, leaving the farmer with the taxes resting on his products. The amount of taxes reduced is about sixteen to seventeen million dollars.

I cannot vote for this bill, Mr. Chairman, in its present shape. Every effort up to this time to afford a measure of relief to the great masses of the people has been rejected. The national banks, with their enormous wealth, say 2,132 of them, with a capital of \$2,358,000,000, can well afford to wait until the people are relieved from the burdens of taxation resting on labor.

The tax on matches is the only item of relief which is offered to the laboring-man. I voted once or twice in the House to remove the match tax, but it failed in the Senate in a former Congress. The tax is very small on matches and on patent medicines, as well as perfumeries, and it is a matter of doubt whether the people will save much by these reductions. The manufacturers are the parties who will make, and not the people, by the proposed reductions. It is the

old story, Mr. Chairman, help for the already rich and powerful and disregard of the toiling millions of our countrymen. The majority in this House have refused to pass Mr. RANDALL's amendment to repeal the taxes on tobacco, manufactured and in the leaf, on cigars, snuff, cigarettes, &c., to take effect the 1st January, 1883. They voted down with a determination worthy of a better cause the efforts of the gentleman from Missouri [Mr. HATCH] to allow farmers to sell tobacco in the leaf without restriction, and the amendment of my colleague [Mr. SCALES] to reduce the tax on spirits to fifty cents and on tobacco to ten cents, besides other amendments which I cannot now take time to enumerate.

So I have offered an amendment to use a portion of the money to be collected by this act for educating the people in the common schools, which has been ruled out on a point of order. Why should this not be done? Fifty millions of people we have, Mr. Chairman, in this great country. The youth of the land should be educated. Said a great man: "Education is the cheap defense of nations;" yea, in my judgment, a better defense than forts and monitors and big guns. The intelligent, patriotic citizen-soldier is the protection and safeguard of American liberty. Behold, Mr. Chairman, 6,500,000 of the colored race, 4,000,000 being slaves in 1860, stretching out their arms to the Government for aid in educating the youth among them. That aid they ought to have, and my vote shall always be given for that purpose. The most of these people are poor and need a helping hand from the Government.

The State of North Carolina, Mr. Chairman, has covered herself with glory in what she has done for the colored children of the State. We have not only given them an equal share of the common-school money with the whites, but we have also established normal colored schools and erected asylums for the colored deaf and dumb and blind, and also for the insane of that race. The public domain of the United States, containing over 1,029,881,942 acres of land, ought to be sacredly set apart for the holy purpose of educating the youth of the land of all colors.

Mr. Chairman, I saw the chairman of the Committee on Appropriations report a bill in the House to supply deficiencies in the payment of pensions amounting to \$16,000,000, which was passed in a few minutes. Ah, we ought to remember that "the victories of peace are no less renowned than those of war," and hasten to do something to educate those who are to follow us.

I clipped the following from the Raleigh (North Carolina) News and Observer, which I read with real pleasure:

STATE COLORED NORMAL SCHOOL.

Closing exercises of the State Colored Normal School at Fayetteville, North Carolina, Thursday, June 22, 1882—Fine declamations and recitations—An original oration "On Farming."

Your reporter, in conformity with a special invitation extended to him by Professor H. Clay Tyson, of the State Colored Normal School, at Fayetteville, to be present at the closing exercises of that institution, on the 22d instant, takes much pleasure in testifying to the graceful and creditable manner in which the students acquitted themselves. This school is a living monument to Democratic generosity. It was created and organized by a two thousand-dollar appropriation from a Democratic Legislature. The principal, Charles W. Chesnut, it is said, speaks French and German fluently. He is nearly white and is exceedingly gentlemanly in his demeanor. He is very modest and unassuming. He is a native of Cumberland County. He is ably assisted by Professor Tyson and Miss Libbie Leary, a niece of Lawyer Leary. All these teachers are thoroughly educated. Principal Chesnut is doing much for his race. He has made this school what it is, every year making the imprint of his own intellectual power visible upon dozens of colored men and girls.

This school is under the general supervision of the State board of education and under the immediate supervision of a local board of managers. During the session just closed there have been in attendance sixty-five male and sixty female pupils, which is more than at any previous session. All acquitted themselves so well that it would be invidious to make a distinction. The oratory was excellent, the recital of poetry by the girls admirable, and the singing was exquisitely sweet. This school is doing a great deal of good in elevating the tone and character of the colored people; and it is a success, answering admirably the purposes of its creation. The money is well spent. It, however, needs a larger building. We were particularly struck by an original speech on farming by a student, A. Bailey, from Harnett, who is about twenty years old, and who has been at school only three years. It was a capital speech, and delivered in a highly creditable manner.

R. B.

This is substantial benefit, and the national Government ought to help in so good a work.

Now, Mr. Chairman, let the internal taxes be abolished on leaf tobacco as well as bank capital, on everything upon which they are laid. Let us reduce and reform the tariff rates, taking the taxes off sugar, salt, coal, and other necessary articles, and regulating those that remain on in a manner just and proper. This will enable the States to lay such taxes upon articles now included in the internal-revenue list as may seem wisest and best. It has been shown that we can dispense with the internal taxes, reduce and modify the tariff rates, and have abundance left to pay the expenses of the Government and to reduce the national debt satisfactorily without oppressing the people.

I do not hesitate to say, Mr. Chairman, that the internal-revenue system is the most corrupt one ever known to our people. Out of it has grown the great whisky rings and the most astounding frauds upon the Treasury. President Grant said a vast sum was lost between the collector's office and the Treasury.

By its unprecedented severity it has caused the death of the peaceable citizen: it has been the direct source of perjury; it has violated the law "every man's castle is his own;" it has brought about

"moonshining," or illicit distilling; it has produced a crop of spies and informers; it has sent forth a vast army of office-holders to be fed off the people; it has sought, and is seeking to corrupt the young men of the country by teaching "You must come with us or get nothing," instead of teaching them from a stand-point of principle; and, not least, it has, with unblushing cheek, taken the money paid by the people to corruptly purchase a continuance in power by bribing the voter.

Gentlemen say let us have "a free ballot and a fair count." Good! I am with you, and while we are at a good work, let us add, "no assessments upon the poor employes of the Government; no more circulars, if you please, from the collector of internal revenue, calling on his staff for a portion of their money to use in buying votes."

When the time comes, Mr. Chairman, that the office seeks the man; when the use of money in buying votes is unknown, then, indeed, we will have "a free ballot and a fair count." Sin and wrong never make a man free. Under their dominion he is bound soul and body. The only freeman is the one who is true, gentle, and merciful; whose glad eye drinks in with joy the beautiful creations of his Maker as they glow in the rainbow, flash in the streamlet, and blush in the rose, conscious that all men are his brethren.

"Civil-Service Reform," so called.

"Honesty is the best policy" as well in political as in business affairs.

REMARKS

OF

HON. WILLIAM R. MOORE,

OF TENNESSEE,

IN THE HOUSE OF REPRESENTATIVES,

Monday, June 19, 1882,

On the bill entitled "A bill to fix the term of office of collectors of internal revenue."

Reit enacted, &c. That hereafter collectors of internal revenue shall be appointed for a term of four years, and shall continue in office until their successors are appointed and qualified.

SEC. 2. That the commissions of all collectors of internal revenue who shall have served four years or more on the 30th day of June, 1882, shall on and with that date expire: *Provided, however,* That they shall hold after that date until their successors are appointed and qualified.

SEC. 3. That the commissions of all collectors of internal revenue who shall not have served four years on the 30th day of June, 1882, shall expire when they have completed their term of four years: *Provided, however,* That they shall hold after the expiration of that term until their successors are appointed and qualified.

SEC. 4. That all acts and parts of acts inconsistent with this act are hereby repealed.

CIVIL-SERVICE REFORM.

Mr. MOORE. The problem of good government is one which has occupied the most thoughtful attention of good men, patriots, and statesmen from the time when "the morning stars first sang together and all the sons of God shouted for joy," even until the present, and it is a problem than which probably none other could possibly more deeply concern the interests and well-being of the entire human race. Coming on down through all the ages that have intervened between the simple garden scene of Eden and the complex scenes which confront mankind to-day, the question of how best to govern themselves has ever been the perplexing problem of the people. When our forefathers threw off their allegiance to British authority, and established upon this continent a Government which all parties now take a special pride in designating as "of the people, by the people, and for the people," it was their habit to speak of this great work as the final achievement of the grand purpose, the complete accomplishment of the ever-desired end, and yet to-day we are not happy. We strive and fret and complain that things are steadily going to the bad, and each party claims to be ever contending for the supremacy of right, while charging upon the other motives of selfish if not unpatriotic aggrandizement.

My assertion, therefore, is that ours is a Government purely of parties, and in the very nature of things cannot but be, and of right ought to be. I will go further, and assert that being a Government of parties, composed of persons in the very essence and nature of things imperfect, the Government must necessarily partake more or less of the nature of its creators, and is therefore itself subject to defects, such as might be logically deduced from the premises. If, therefore, it be admitted, as I think it will, that this is a Government of parties, it will naturally follow that these parties, each promulgating and defending a different theory or theories, cannot be equally in the interest or for the advantage of the people to be governed. In other words, however sincere the adherents of either may be in the propagation of their respective theories, the fact will remain that the success of the principles of one of these parties will inure more to the general interests of the people than the success of the other. Now,

there are to-day substantially only two great political parties in our Government, the Democratic and the Republican. I shall not speak of the small factions of either.

Gentlemen on the other side of this House adhere to the Democratic party because they have been taught to follow its lead, and because their grandfathers did so before them. Some of us on this side think the Republican party the only party through which both individuals and nations may successfully reach their highest form of development, and upon this there is joined an earnest and serious issue by the people to see which party shall retain or get control of the governmental machinery in order to enable them to inaugurate and maintain their respective policies. I see nothing wrong or improper in any honorable efforts of either party to effect this purpose; and the very earnestness and industry with which both pursue it presuppose differences in their respective theories radically at variance with the other's preconceived ideas of right and propriety.

If, now, my position be accepted as fair and tenable, it follows that in order to faithfully carry out any party policy we must have active and sympathetic assistants, else we cannot reasonably hope to attain any positive success. If Democrats, for instance, desiring the propagation among the people of their free-trade theories, should send among them agents making tariff speeches and distributing "protection" literature, they could scarcely be surprised if disinterested observers were to charge them with—to speak it mildly—a want of good, political, business sense. For myself, I should certainly do so. If, furthermore, the Republicans of my own State, who are and have been earnestly and at great odds striving to maintain the credit and good name of Tennessee, should, after electing their ticket in the coming exciting campaign, set to work to fill all the minor offices with their late Bourbon competitors who sought to repudiate the debt and degrade the good name of the honest masses, would outside observers, could any sane man get his consent to compliment the party for its wisdom? I believe that even our wiser enemies would feel a contempt for such a policy.

Mr. Speaker, we hear, and have long heard, much said about "civil-service reform," and we have heard it, too, from men who have themselves been ever conspicuous as party leaders, men recognized everywhere as among the very foremost in setting up party platforms, and driving upon them sometimes reluctant followers. What inconsistency, therefore, in urging any party measure, and then, after a party success, turning one's back upon the very agents whose time, talents, and money have been given to said party through the influential appeals made by these same eloquent party leaders.

"The Civil Service Reform Association of Philadelphia" sets out in one of its pamphlets with the assertion that "a free country can only be governed by political parties; and the dominant party must, by election or appointment, fill with its representatives those offices which control that policy of which the country has expressed its approval by putting the party in power." Now, this seems to me an eminently sound principle, and is one with which I heartily agree. But the same pamphlet proceeds to add, that "the Government of the United States, the States, counties, cities, towns, and boroughs have employes whose duties are purely administrative and ministerial, without any political character or significance; and these employes, in number as the sands of the sea, constitute the civil service of the country," to which I join issue.

In a government like ours there are comparatively few civil offices completely dissociated from "political" influences. Wherever such an office may exist I can see no objection to this pretty theory; but their existence is so rare in a government by all the people, like ours, as to be almost phenomenal. We are a nation of politicians, and every American voter feels himself not only competent but called upon to express his opinion, and to contribute of his influence.

Senator PENDLETON, in his recent "civil-service reform" speech says:

The offices of the Government, those involving neither political power nor the choice of politics, but routine administration only, touch at some point and in some degree the material interests of every one of our fifty million people.

Now, I do not believe there are any such offices; but that on the contrary every office, however subordinate, exercises a direct and sensible influence upon the surroundings through the occupant who may be performing its duties.

Take, for instance, one of the smallest cross-roads country post-offices. The so-called "civil-service reformers" would no doubt consider one of this class, paying a compensation of not over \$12 a year, a non-political office; whereas I contend that the influence exerted even through that single office is so positive as to be difficult to accurately measure. If this little postmaster were not to utter during the year a single political preference or sentiment, the very knowledge alone and of itself that he was, in his convictions, even silently, friendly or unfriendly to the administration that conferred the office upon him, would exercise such an influence upon the unsophisticated rural neighbors that congregate about his office once a week to read their weekly newspapers as might decide the complexion of the vote in the little precinct, and in a close canvass be really the turning point that might carry the county and, indirectly at least, fix the political policy of a State or nation. It will not do to ignore these little matters. "Large streams from little fountains flow." If policies are worth cultivating it is worth while to place their execution in the hands of friends rather than enemies; for all men must, directly or

indirectly, come under one or the other of these designations. There can be no such thing as an intelligent and conscientious "neutral." He must either serve God or Mammon, and "we do not gather grapes of thorns nor figs of thistles."

It is very frequently the case that subordinate employes, even in the more obscure offices, are discovered to be active and efficient agents in the dissemination of partisan theories either for or against the party in power, as the case may happen to be. Mr. PENDLETON further says:

To say that the men best fitted for the work should be appointed to these offices, and should hold them until men still better fitted should appear, is to utter a truism which not one of these fifty millions will controvert.

Now, if we were ready to admit his assumption that "the men best fitted" for these same "unimportant" offices could not be found without going into the ranks of the enemy for them, then, indeed, there might possibly be some force in his argument. But we do not admit his premises. There are in either of the great parties enough men of capability and clerical accomplishments to fill, creditably, all the offices under the Government; and it would not be safe to say that these men were more numerous, capable, and accomplished in one party than the other.

I think it entirely safe to assert that each party has plentiful and capable material to fill creditably every office under the Government of the country, so far as clerical qualifications are concerned. The distinguished Senator has much to say about "the spoils system," which, if it be a bad one as he claims, is certainly not the child of Republican paternity. He says it opens up "to every man who will see even without thinking a vision of wrong, injustice, brutality, wastefulness, recklessness, fraud, speculation, degradation of persons and of parties," &c. Now, if offices were to be indiscriminately bestowed for no other reasons than that the occupant had performed a party service, even without regard to its honorable character, there might and would properly be much force in the favorite argument; but if the distinguished Senator is prepared to say that in even a small office, he, as a Democratic candidate for the Presidency of the United States, would not give the preference to a voter of his own party, all other qualifications and circumstances being equal, then is he prepared to make to me a reply which would not gain him many votes for the high position aspired to. I much mistake his character if he would risk such an admission.

The Democrat who invented the now famous phrase, "to the victors belong the spoils," spoke more nearly true than most of that party of this day. If he had said that party success gained in fair and honorable party warfare entitled the successful party to be wholly officered by its capable, efficient, and faithful party friends and adherents, he would have expressed what I believe to be the only wise and proper rule. I have no patience for nor sympathy with any party who, after climbing to success, deliberately refuses to prefer before its enemies the active and sympathetic friends who made its success possible. Call me what you will. That sort of sentimentality is totally distasteful and repugnant to my homely and practical ideas of patriotism and party propriety. I believe it better to be honest toward one's opponents, and tell them fairly and frankly that you mean by all fair and honorable efforts to defeat them if possible and reward your friends. "Honesty is the best policy" applies, I believe, as well in political as in business affairs; at any rate the experiment might be introduced into at least one general political campaign, in order to test its efficacy.

It is a habit among the advocates of the so-called "civil-service reform" to parade before the American people the government of England as a model to be adopted by our Government, and they never tire of telling us what has been accomplished there "after centuries of maladministration, and despite the opposition of blind conservatism and interested political and aristocratic influences;" as if the circumstances surrounding and peculiar to the two nations were in any manner analogous. The very nature and basis of our Government preclude the adoption by us of any monarchical precedents, and revolt at the bare idea of creating among us any aristocratic or privileged classes of permanent office-holders, as would necessarily grow up in this Government under the system advocated by the so-called civil-service reformers.

Rotation and change are principles irreversibly stamped upon the American mind as right and proper and expedient in their application to all the interests of good republican government, and are in accord with both the genius and spirit of our institutions; and until the favorite and now universally conceded theory that this is a government of, for, and by the people thereof is abandoned, the fixing of any permanent official classes upon them will, in my opinion, be a signal failure. What is the object of government? Is it not for the purpose of enabling a people to protect and enjoy the usufruct of their honest toil and labor? Is it not intended to protect them at least cost and trouble in the enjoyment of their rights, of life, liberty, and the pursuit of happiness? If so, then why wish to confine the legitimate and necessary honors and emoluments (I protest against the favorite word "spoils" as used always with such gusto by the so-called reformers) to a privileged and pampered few, to be fixed by this unwise system for a lifetime upon the helpless masses? Sir, it is a system that will not, in my opinion, be easily ingrafted upon the Government of the United States without first changing our entire form.

I can easily see how, for England or any other monarchical government, permanent official tenure could be consistently advocated, but I am unable to see how any American statesman can advocate the system under our form, unless he does so as an incipient step in a change which he would insidiously inaugurate in what is already proudly known as, or believed to be, "the best Government the world ever knew." No, no. That kind of "civil-service reform" is not the kind wanted by the American people. But what they do want is, as I believe, in substance, as follows, namely: They want a law defining and fixing terms of official service, and giving every man a fair and equal chance to the offices, honors, and emoluments of his Government. The Government has a right to claim his services when they are needed for defense, and should, in turn, grant him full and ample protection in all his legal rights, while throwing freely open, also, to him every avenue to public honor and distinction.

If the time should ever come when there is but one great party in this Government, then I might be heartily in favor of filling the offices by competitive examination from men regardless of political bias, for then there can be no impolicy in the plan, but so long as there exist two parties representing totally diverse theories of government, my common sense revolts at the idea of trying to carry out any set of political doctrines with officers or agents who are enemies to such doctrines and who conscientiously believe it to be their duty to defeat them. "Civil-service reformers" may be enabled to reconcile this paradox to their sense of consistency, but I must be permitted to confess my inability.

When the political millennium shall have come, then, indeed, may the Republican lion and the Democratic lamb be expected to lie down together, and the country be permitted to look upon the pleasing spectacle of the simple-minded, harmless, and unsophisticated Greenbacker gently leading them. But until then we shall have at least two great parties contending for the control and dispensation of the policy and patronage of this Government.

Let us for a moment examine the condition of parties to-day. The political power of the people is now on almost an equipoise, and great forces are silently and steadily at work, which must inevitably ere long sensibly disturb this balance.

Do we, who to-day hold this delicate and trembling balance, desire to increase or to relinquish our trifling advantage? This is an important party inquiry, and I would feel encouraged with a pleasing hope if the President and each member of his Cabinet were to give it even a passing thought. It could not damage the interests of our party were they to simply ask the question whether friends or enemies are to-day holding important official positions that furnish facilities to advance or retard the principles which have so conspicuously placed the great Republican party in the very vanguard of the mightiest and noblest of all the parties of the earth.

And in this connection it may not be wholly uninteresting to them and ourselves and to the country to lay before Congress a carefully-compiled statement of the official condition of the various departments of the Government at the present time.

They furnish a vast deal of nutritious food for political digestion, and if they shall tend to call forth official consideration my efforts will not have been in vain. I shall give these tables without note or comment, merely asking for them that careful examination, consideration, and comparison which their great importance demands, and which the glaring irregularities suggested by their figures so forcibly suggest. I ask their careful study, especially by those distinguished civil-service reformers, Senators HOAR, PENDLETON, George William Curtis, and all others who are following in the lead of these able and distinguished statesmen:

Now, Mr. Speaker, it will be seen by the above carefully-prepared tables, which it is believed on examination will be found substantially correct, that gross inequalities and great disproportions exist in all the governmental departments in Washington; and that a thorough and real civil service reform should be at once set on foot at the fountain head of political power. The present total apparent absence of system should be superseded by one which recognizes first the right of each State and Congressional district to be proportionally represented in the various departments; and second that these places should be filled only by those who are clerically qualified and in full sympathy with the policy of the controlling party. As it is at present the Departments are filled in some places, it is said, by those who are not even citizens of the United States. In others by those who, while being credited to certain States and sections, are almost total strangers to, if indeed they ever saw, the places which they falsely claim to represent. This is wrong. It is

bad policy because it is wholly unjust, and therefore highly inexpedient. Any policy which is admittedly unjust ought not to receive the sanction of rulers laying claims to statesmanship. Wisdom and justice and expediency, each and all, demand that every State and every Congressional district shall be fairly and proportionally represented in a people's government like ours. The Boston Herald says:

Congressmen have no business to meddle with appointments to office. They are elected to make laws. Appointment to office is an executive act. How hard it is to surrender a usurped prerogative! How like grim death the average Congressman hangs on to the spoils!

Of course Congressmen have no constitutional right to make appointments. Nobody ever claimed that they had, but if they are not elected and sent to Washington to consult, advise, and confer especially with the President in regard to all political affairs in their respective districts, including the "appointments" to offices within their jurisdiction by the President as well as "to make laws," then the scope and extent of their duty, authority, and calling are sadly misunderstood by everybody but the Boston Herald and its intelligent followers. How is it possible for the President to know the local wants of every Congressional district throughout this stupendous country unless he first obtains the information from some reliable source, and from what sources is he so likely to obtain it as from the Congressional Representative whom the people have honored with their confidence for the express purpose of furnishing such official information? The President must have advisers. His Cabinet cannot, in the nature of things, give all this necessary local information. Who, then, can presumably be so well fitted and qualified to furnish it? Surely no one so accurately and so safely as the member of Congress. I conclude, therefore, that if there be one thing in all our political system more wise and proper than another, it is that custom and usage which recognize the right of Representatives to confer and advise with their President in all appointments relating to offices in their respective Congressional districts throughout the United States. Nobody pretends to assert that the President should relinquish any of his present constitutional power and prerogative in respect thereto; but we do mean to say that any President who would fail so to confer and advise, or who would wholly disregard the principle which has by common consent so long and so wisely governed the conduct of the Executive, would, in a very brief time, find himself so hedged about with disfavor, difficulties, and opposition as to render him anxious to end the brief term of a single unsuccessful administration. We would not assert that the President should be at all times restricted and bound by the advice of the Representative, but we do mean to say that he should be well satisfied of his own position before ignoring such advice, conference, and consultation.

No man, Mr. Speaker, is more in favor of civil-service reform than myself, but I want a real not a sham civil-service reform. I do not want, I would not have, any person to hold any official position unless he was first honest, capable, and efficient, and I would never, moreover, consent that an aspirant, possessing even these necessary qualifications, should hold office unless he was additionally qualified by a positive sympathy with and hearty indorsement of the principles of the party in control. If the party has principles worth contending for in an arduous and toilsome campaign, I consider it the height of folly after its success at the polls to turn over its management to those against whom it has lately been contending, and those, too, who honestly believe its principles to be erroneous.

It is, in my opinion, utterly out of the question as a practical matter—and that which is not practical in politics is as valueless as in other affairs of real life—to think of building up and maintaining the ascendancy of any party unless both the official honors and emoluments of the Government, legitimately inhering, shall be always open to honorable and manly competition from all aspirants. There are now sixty-eight men directly affected by the operations of the law under consideration, and these men have held their places from twenty years downward. I can see no sound reason why they should be singled out from all the other departments of the Government and made invidious and partial exceptions. The fact that they are honest men, capable men, and men of unblemished character offers no sufficient justification. There are others outside equally capable and worthy, and as the policy of the Government recognizes changes in other offices, why not adopt a general rule and enable this class also to present their claims to the Government, that all should have an honest pride and ambition in serving?

Let this system of pampered petting be once fixed upon the policy of the Government; let it be understood (as some in the country are already beginning to conclude) that this Government, claimed to be "of, by, and for the people," is really, after all, only a Government for the benefit of a few favored officers in the Department of Internal Revenue—and there are probably no other more worthy officers in the country—I say, let this idea become fastened upon the people, and it will require no extraordinary prescience to foretell the speedy decay and dissolution of the party which may be responsible for its authorship and advocate of its continuance.

The great difficulty with the advocates of so-called civil-service reform is that they would try and cheat themselves into the belief in the existence here all of a sudden of a sort of millennial Arcadia; that by some magical political act of legislative legerdemain our poor human nature can be all at once metamorphosed into a condition

where strivings for individual promotion and honorable contentions for party supremacy have forever ceased. The bare contemplation of this foolishness by those who know that we still are but men and subject to the jealousies and rivalries which have ever characterized humanity excites general public derision. If, therefore, we accept this view, which logically leads to the absolute necessity of parties, it were worse than futile to undertake to combat the wisdom of sustaining by all our might that party policy which most nearly meets the approbation of our judgment and the indorsement of our common sense.

Parties are built up, presumably, upon the basis of great and just principles; and when there is an absence of such basis, as in the case of the present Bourbon Democratic party, of course there can be no steady or assured success. The Republican party grew into a successful and magnificent existence because it has always had a conscience, and because, also, it has never been afraid to labor and fight for its convictions. The Bourbon Democracy, on the contrary, has never had an honest conviction, but has for the past twenty-five years boxed every point of the political compass in search, not of any principle, but of some meaningless subterfuge upon which they might ride temporarily into power; and to hear them now, after their malodorous record of the past quarter of a century, crying "Reform!" "Reform!" is very like parading up and down the public highway the scarlet queen of the political *demi-monde*, with "virtue" in large red capitals boldly inscribed upon her brazen forehead. There are too many spelling-books, railways, telegraphs, and printing-presses in the country to-day to prevent the honest masses being led away from the great living issues of the grand Republican party. They know already too well how thoroughly conscienceless and characterless the Bourbon Democracy is. They know that the exhibition of a single accidental spasm of conscience, of common sense, of virtue, and of common honesty by that political harlot would furnish an item of morning news that would thrill and startle every breakfast table throughout Christendom.

Why not try to be fair and square and honest toward ourselves, toward each other, and toward the country? Why pretend or lay claim to a superserviceable, sublimated, ethereal virtue altogether above this wicked world, and too pure to breathe its atmosphere? I do not believe it either wise or expedient to assert such claims. Let us therefore accept and recognize the homely fact that we are all at best "of the earth, earthy." Let us remember that parties are necessary in order to organize and sustain our earthly governments; that neither parties nor governments can be run successfully without money; that the friends of a given party, and not its enemies, are expected to contribute to its support; and that there is not only no impropriety nor injustice in asking voluntary contributions from both its official and non-official adherents, but that it is eminently wise, proper, and just that it should be done.

Internal-Revenue Bill.

SPEECH

OF

HON. J. RANDOLPH TUCKER,
OF VIRGINIA,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, June 27, 1882,

On the bill (H. R. No. 5538) to reduce internal-revenue taxation.

MR. TUCKER said:

MR. SPEAKER: I desire to give my reasons for not voting for this bill. It is not that I do not approve of taking off the taxes on checks, matches, medicines, and reducing those on cigars and cigarettes. Nor is it because I do not favor the repeal of taxes on capital and deposits of private bankers and of State banks. All of these taxes are special. The Government, without any view to equality of burden, selects these for its victims. It singles out the depositor in a bank, whose money is no more justly liable to tax than the money of a man which he keeps in his private vault. Yet the depositor is taxed, and his right to withdraw his deposits by check is taxed. This is invidious, unequal, and unjust.

Why should the capital of a banker be taxed any more than that of a manufacturer or a merchant? Burdens are unequally laid by this special system of taxation, and Government has no right capriciously to strike directly at any business which the States allow, or indirectly through taxation. Capital and deposits in national banks stand on a different basis. These banks have special benefits of great value conferred on them, and in recompense for these special benefits the Government may impose special burdens; but I would not oppose the repeal of these taxes on capital and deposits of national banks, not because they are special objects of my sympathy, but because banks make these taxes a pretext, as they are doubtless one

main cause for the increase of the rate of interest on their loans, and the tax is thus not really, though directly, paid by the banks, but by the borrowers from them, whose rate of interest is increased to compensate for the taxes paid directly by the banks. The repeal of these taxes on bank capital and deposits is in the interest of a decrease in the rate of interest and for the relief of the people, not of the banks. I favor it.

The proposed reduction of the tax on cigars and cigarettes is right, because it equalizes the tax on the tobacco in them with smoking-tobacco in packages. I go further. I favor the bill because it reduces revenue about \$20,000,000. This with me is a strong ground on which to support it. A full Treasury invites extravagance; a scant Treasury compels economy.

In 1875, when I entered Congress, the revenue was \$288,000,051.10. It is estimated for this year at \$400,000,000. The annual interest in 1875 was \$103,093,504.57. For this year it is estimated at \$70,000,000. Our expenditure in 1875 was \$274,623,392.84; or, deducting interest, was \$171,529,888.27. In 1882, it is estimated at \$270,000,000; or, less interest, at \$200,000,000. For 1883 it is estimated at \$294,850,793.43; or, less estimate for interest—\$65,000,000—it will be about \$230,000,000. This increase, it is true, is largely for arrears of pensions. See how we tend to extravagance as our revenues increase!

The figures for the period from 1875 to 1883, actual and estimated, by the last report of the Secretary of the Treasury, are instructive, and I give them, only saying that this Congress will exceed the estimate for the coming year. During the period of Democratic ascendancy in this House we reduced expenditures, less pensions and interest, to about \$107,000,000 in 1878. This year it will reach \$160,000,000:

REVENUE.			
Year.	Total.	Customs.	Internal revenue.
1875.....	\$288,000,051 10	\$157,167,722 35	\$110,007,493 58
1876.....	287,482,039 16	148,071,984 61	116,700,732 03
1877.....	269,000,586 62	136,956,493 07	118,630,407 83
1878.....	257,763,878 70	130,170,680 20	110,581,624 74
1879.....	273,827,184 46	137,250,047 70	113,561,610 58
1880.....	333,526,610 98	186,522,064 60	124,009,373 92
1881.....	360,782,292 57	198,150,676 02	135,264,385 51
1882, (estimated).....	400,000,000 00		
1883, (estimated).....	400,000,000 00		

EXPENSES.			
Year.	Total.	Pensions.	Interest on the public debt.
1875.....	\$278,623,392 84	\$29,456,216 22	\$103,093,544 57
1876.....	258,459,797 33	28,257,395 09	100,243,271 23
1877.....	238,660,008 93	27,963,752 27	97,124,511 58
1878.....	236,964,326 80	27,137,019 08	102,500,874 65
1879.....	206,947,883 53	35,121,482 39	105,327,949 00
1880.....	267,642,957 78	56,777,174 44	95,757,575 11
1881.....	260,712,887 59	50,059,279 62	82,508,741 18
1882, (estimated).....	270,000,000 00	80,000,000 00	70,000,000 00
1883, (estimated).....	294,850,793 43	100,000,000 00	65,000,000 00

No man believes that the arrears of pensions bill or any other of the bills for increased expenditure passed at this session could have been passed seven years ago. Why? Because then we had not the means for extravagance; now we have. Then we had necessity for economy; now we have none. Under our system of an unchangeable and permanent revenue we have in flush times a redundant income; in tight times a stinted income. We are lavish in expense when full-handed and become economical only when driven to it by the reduction of our revenue. I go for reduction of taxes in order to reduce revenue and in order thereby to compel economy. Let the people keep their own money and spend or invest it as they please. They will do it better than it can or will be done by the Government which takes it from them by taxation, and then spends it on the favored objects of its bounty. It is a great mistake to say the people get back the money they pay in taxes. Tax money rarely gets back to the pocket from which it was abstracted. Our people need to learn that taxation and expenditure by governments is the great means by which a distribution of the wealth of the many may be and is transferred to the few, and our true policy consists in limiting this double process of abstraction from the many and bestowment on the few to the narrowest bounds consistent with the efficiency of the Government to secure the peace and order of society.

If, then, this bill does so much that I favor, why will I vote against it? I answer, it is not that I oppose what it does, but for what it fails to do. "These ought ye to have done, but not to leave the others undone." In vain did we in committee, as in this House, ask the dominant party to lift the burden of taxation from tobacco and let it go free. We asked to take off duty from beer, to reduce it on whisky, but the Republican party, with almost solid negative voice, refused. The tax on capital and deposits in banks is very small. It is one-half of 1 per cent; that is, taking the rate of interest at even as low as 4 per cent. It is only 12½ per cent. on the

annual product of the capital. It is paid by the bankers and banks or their well-to-do borrowers, for the very poor do not borrow much from banks.

The tax on checks is annoying, but it is a slight per cent. upon the means of the depositor. But look at your tax on tobacco. It has been said on this floor that the free-leaf amendment is inadmissible, because in order to collect the tax on tobacco the Government must keep a watch on it from its planting to its sale. The planter is not free to sell to everybody, lest fraud may creep in and cheat the Government of its tribute. The tax cannot be collected unless the planter is watched and trammelled as to the sale of his crop. Spies must dog his steps and keep their eyes upon his dealing with his own product in order that the tax may all be collected.

Under our free institutions one would think that a tax which can only be collected by such a system of espionage should be repealed and not perpetuated. But this is not the view of the party in power.

Tobacco is the only product of agriculture which is taxed by this Government, and to deal in which freely by the producer is a crime. His freedom to trade in his own hard-earned product is prohibited that the Government may get its tax. And what is the tax?

The total crop of tobacco for 1880 was 427,000,000 pounds, of which 227,000,000 was exported and not taxed, valued at, say, \$42,700,000. The taxes collected on it last year were about \$42,000,000, or 100 per cent. on the whole crop, and more than 200 per cent. on that not exported. But this does not present the whole case. Tobacco ranges in price from 3 to 50 cents per pound. The average price is about 10 cents per pound. The same tax is laid on all, and as the low-priced is consumed by the poor, and the high-priced by the rich, it follows that while the highest-priced pays 16 cents tax per pound, or from 50 to 100 per cent. revenue, the lowest-priced pays the same specific tax, or over 500 per cent. ad valorem. The poor pay five times as much in proportion to the value of the article consumed as the rich. Is not this a gross injustice on the various classes of consumers?

But this tax presses on the producer. It is true the consumer ordinarily pays the tax. If it is a low tax, he may be said always to do so. But as the tax becomes higher the producer, in order to hold on to the market, will have to abate his price, thereby paying the tax in part. But when the market can no longer be retained without a loss the production will cease wholly.

And this has been the result in parts of Virginia where the low-priced tobacco is raised. Production has ceased. You have taxed the planter out of his right to use his own land for the growing of tobacco. You have lessened the value of his land and impaired his title; but his outcry for the repeal of this tax you will not heed.

You tell him it is a luxury. Is the tobacco of the poor as great a luxury as that of the rich? Why, then, tax the rich man's tobacco at one-fifth the rate you impose on that of the poor? Do you mean to forbid a luxury to the poor which you permit to the rich?

But what right has this Government to forbid production by the owner of land in a State, on the ground that it is a luxury? Has this Federal Government the right to pry into the industries permitted by the States and set up one and put down another? While it protects manufacturers in their products by bounties exacted as a tribute from the planter, can it strike down the planter by taxing him out of his right and power to produce at all? Is this equality and justice? Is it not rank injustice?

We, the Democrats of the House, asked the repeal of this tax—this tax so destructive of the products of the planter, so unjust to the consumer. The banks asked the repeal of the tax of 12½ per cent. on the annual interest of their capital. The repeal we asked was of a more grievous burden of from 100 to 500 per cent. on the annual crop of the planter. You lift the light tax from moneyed capital and leave the heavy tax on the landed capital of the planter. Reverse the case. What would banks think if 100 per cent. was laid on the interest of their capital, or 400 per cent.? Tobacco would gladly exchange with moneyed capital and take the tax of which capital complains to be relieved from that which you leave tobacco to bear. A party caucus of the Republicans forbade the repeal of the tax on tobacco, but required the repeal of the tax on bank capital. And this bill is the result—to lift light burdens from the banks and their customers and leave heavy burdens on the planter and the consumers of his tobacco.

Now the question is, What ought I to do in respect to this measure?

I have already voted in Committee of the Whole to take off all the taxes proposed to be repealed by this bill, as it will pass. I know that will be done. But this bill refuses, with emphasis, the repeal of taxes more onerous on the tobacco planters than those it removes from banks and bankers. If I vote for it I will seem to sanction this refusal to repeal, as well as the repeal it effects. This I cannot, will not do. I must therefore vote against this bill, because it is a mockery of right and justice. It takes off light burdens and retains heavy ones. It relieves those who least need relief, and refuses to relieve those who most need it.

Those who are thus relieved would have been willing to vote relief to the tobacco planter if it was needed to secure their own. We have tried to make them go together; but Republican tactics have defeated us, and the Republican party will secure by the passage of this bill relief to the bank power, and leave under their heavy burdens the planters of tobacco. The latter are left to endure an op-

pressive tax which the former, being free, will have no interest in future to aid us in removing.

I shall therefore vote against the bill; for I know, if thereby it is defeated, the banks would be ready by a new bill to achieve their own relief by according like relief to the tobacco planters. If it is not defeated, the bankers will never hereafter aid us in repealing our burdens, but like the butler released from the Egyptian prison, will forget the Joseph who remains in bonds.

I know it is argued the Government cannot afford to let go its tobacco tax, and that by so doing we will induce a higher tariff.

A word on each of these points. First, the repeal of the tobacco tax would reduce the revenue, say, \$50,000,000. This would make a total reduction by this bill of, say, \$70,000,000. The revenue for this year from all sources will be about \$400,000,000. By the proposed reduction the annual revenue would be, say, \$330,000,000. Annual ordinary expenditures for the next year will be \$145,000,000. Pen-sions, say, \$100,000,000, and interest on public debt about \$60,000,000; in all \$305,000,000. This would leave a surplus for the sinking fund, and by leaving only so small a surplus would make us so cautious in expenditure that we would really reduce the ordinary expenses and avoid extravagances in other directions. Second, would a repeal of these taxes induce a resort to a high tariff? On the contrary, if the Government for its revenue were left to a tariff on imports, it would be driven to reform the tariff on revenue principles. Duties would be laid to increase revenue, not to prohibit imports, thus destroying revenue. A revenue tariff would be the necessity of the Government if internal taxes were repealed.

Let the friends of revenue reform and the Democratic party stand firm. Economy in public expenses is our cardinal principle. Decrease of taxes another. Lighten the people's burdens. Decrease of revenue resulting from a decrease of taxes would diminish jobs and plunder and patronage. This is in the direction of true civil-service reform. The internal-revenue system is a fearful nest, from which public patronage hatches the instruments for controlling elections in the States. We must labor to repeal the whole system. Duties laid with a view to the required revenue upon our largely increasing imports will suffice for an economical and efficient administration of the Government, and will less interfere with the freedom of political opinion in the country, now so much menaced by Federal patronage. Corruption, which is produced always by extravagance, which itself is induced by an overflowing Treasury, would be checked by a return to a strictly revenue system and an economical administration of public affairs. The abolition of the internal-revenue system would break up those nests of Federal patronage which have infested the States for twenty years, and have been the source of more petty tyranny and of more interference with the freedom of elections by the patronage of the Federal power than has ever been known in the history of the country. With these principles and this policy the Democratic party will win a victory for right, justice, purity, liberty, and the Constitution.

Correction of Error in Duties on Hosiery and Knit Goods.

SPEECH

OF

HON. OSSIAN RAY,

OF NEW HAMPSHIRE,

IN THE HOUSE OF REPRESENTATIVES,

Monday, July 3, 1882,

On the bill (H. R. No. 6715) to correct an error in section 2504 of the Revised Statutes of the United States.

Mr. RAY said:

Mr. SPEAKER: Was there a blunder or mistake made by the revisers in compiling the laws of the United States in force December 1, 1873, touching the duties on woolen hosiery and other woolen knit goods? The commissioners were authorized and directed to revise and consolidate the statutes of the United States then in force, but not to change or vary in substance any existing law. The object was to compile into a single volume all of the United States laws of a public and general character for the sake of convenient and easy reference.

The trouble is that some of the same articles are included in both Schedules L and M and are subjected to the payment of different duties. In Schedule L (Revised Statutes, last edition, pages 471-472) custom duties are laid upon—

All manufactures of wool of every description made wholly or in part of wool, not herein otherwise provided for, 50 cents per pound, and in addition thereto 35 per cent. ad valorem; * * * knit goods * * * and all manufactures of every description composed wholly or in part of worsted, * * * except such as are composed in part of wool, not otherwise provided for, valued at not exceeding 40 cents per pound, 20 cents per pound; valued at above 40 cents per pound and not exceeding 60 cents per pound, 30 cents per pound; valued at above 60 cents per pound and not exceeding 80 cents per pound, 40 cents per pound; valued at above 80 cents per pound, 50 cents per pound; and in addition thereto, upon all

the above-named articles, 35 per cent. ad valorem. Clothing, ready-made, and wearing apparel of every description * * * composed wholly or in part of wool, worsted, * * * made up or manufactured wholly or in part by the tailor, seamstress, or manufacturer, except knit goods, 50 cents per pound, and in addition thereto, 40 per cent. ad valorem.

It is clear that the foregoing provisions include every possible variety of woolen knit goods and hosiery.

Now, in Schedule M, page 474, of the Revised Statutes, immediately after Schedule L, we find the following:

Clothing, ready-made, and wearing apparel of every description, of whatever material composed, except wool, silk, and linen, made up or manufactured wholly or in part by the tailor, seamstress, or manufacturer, not otherwise provided for; caps, gloves, leggins, mitts, socks, stockings, wove shirts and drawers, and all similar articles made on frames, of whatever material composed, except silk and linen, worn by men, women, or children, and not otherwise provided for; articles worn by men, women, or children, of whatever material composed, except silk and linen, made up, or made wholly or in part by hand, not otherwise provided for: 35 per cent. ad valorem.

The second and last clauses of this paragraph are embraced within the first clause; but while the word "wool" is included in the first clause, it is omitted in the last two clauses. From this all the trouble has come. This was a mere mistake on the part of the commissioners. After inserting "clothing, ready-made, and wearing apparel of every description, of whatever material composed, except wool, silk, and linen, made up or manufactured wholly or in part by the tailor, seamstress, or manufacturer, not otherwise provided for," they might have stopped, because anything made of wool had already been excepted.

Why insert wool in the first clause of this paragraph in connection with silk and linen, and not in the other two clauses? Why except silk and linen knit goods from the operation of the 35 per cent. ad valorem duty, and not knit goods made of wool? The most reasonable explanation of this absurdity is a mistake in the revision. Knit goods manufactured wholly or in part of wool are certainly subject to the pound duty and also to 35 per cent. ad valorem by the provisions of Schedule L, while in Schedule M all knit caps, gloves, leggins, mitts, socks, stockings, wove shirts and drawers, and all similar articles made on frames, of whatever material composed, except silk and linen worn by men, women, or children; indeed, all knit articles worn by men, women, or children of whatever material composed, except silk and linen, whether made up or made wholly or in part by hand, are only subject to the single ad valorem duty of 35 per cent.

Thus we have in Revised Statutes the article of woolen knit goods included in both Schedules L and M, but subjected to entirely different and inconsistent rates of duty. Both duties on the same goods ought not to be and cannot be collected. No such absurdity was ever intended by the law-making power. Did this blunder happen in the enactment or revision of the laws?

The Supreme Court, in the recent case of Victor against Arthur, not yet reported, following a well-known rule of construction, held that although leggins, mitts, socks, wove shirts, drawers, &c., would naturally and properly be included in the general description of knit goods mentioned in Schedule L as subject to the double duty, still, finding the above kinds of knit goods specifically named in Schedule M, when not made of silk and linen, subject only to the 35 per cent. ad valorem duty, were obliged to decide as they did, that the double duty cannot be imposed upon the particular kinds of knit goods specified in Schedule M as subject only to the ad valorem 35 per cent. duty. The court expressly says, however, "It may be true, as suggested, that if there had been no revision, and if it had been required to construe the statutes as they stood before December 1, 1873, [the time of the revision,] a different conclusion might have been reached."

The next inquiry is, what was the lawful duty on woolen hosiery and knit goods, so called, December 1, 1873? The tariff act, approved March 2, 1867, was the last law passed by Congress upon this subject before the revision of 1873. So far as is material to the present discussion, the following provisions of that act may be referred to:

SEC. 2. And be it further enacted, That in lieu of the duties heretofore imposed by law on the articles hereinafter mentioned, and on such as may now be exempt from duty, there shall be levied, collected, and paid on the goods, wares, and merchandise herein enumerated and provided for, imported from foreign countries, the following duties and rates of duty; that is to say:

On woolen cloths, woolen shawls, and all manufactures of wool of every description, made wholly or in part of wool, not herein otherwise provided for, 50 cents per pound, and in addition thereto, 35 per cent. ad valorem.

On flannels, blankets, hats of wool, knit goods, balmorals, woolen and worsted yarns, and all manufactures of every description composed wholly or in part of worsted, the hair of the alpaca, goat, or other like animals, except such as are composed in part of wool, not otherwise provided for, valued at not exceeding 40 cents per pound, 20 cents per pound; valued at above 40 cents per pound and not exceeding 60 cents per pound, 30 cents per pound; valued at above 60 cents per pound and not exceeding 80 cents per pound, 40 cents per pound; valued at above 80 cents per pound, 50 cents per pound; and, in addition thereto, upon all the above-named articles, 35 per cent. ad valorem.

On clothing ready-made, and wearing apparel of every description, and balmoral skirts and skirting, and goods of similar description, or used for like purposes, composed wholly or in part of wool, worsted, the hair of the alpaca, goat, or other like animals, made up or manufactured wholly or in part by the tailor, seamstress, or manufacturer, except knit goods, 50 cents per pound, and, in addition thereto, 40 per cent. ad valorem. (14 Statutes at Large, 561.)

It is certain that "all manufactures of wool of every description, made wholly or in part of wool," are subject to a duty of 50 cents per pound and 35 per cent. ad valorem. It is also perfectly certain that flannels, blankets, wool hats, knit goods, &c., are subject to a pound duty graded as above specified and 35 per cent. ad valorem.

It is equally clear that ready-made clothing and wearing apparel of every description, &c., composed wholly or in part of wool, worsted, &c., made up or manufactured wholly or in part, &c., except knit goods, were subject to a duty of 50 cents per pound, and in addition thereto 40 per cent. ad valorem by that act.

These were the duties laid upon such articles and manufactures by the tariff act of March 2, 1867, and which were in force December 1, 1873, at the time of the revision of the statutes. Now, note the peculiar and explicit wording of the enacting clause of section 2, which is, that "in lieu of the duties heretofore imposed by law on the articles hereinafter mentioned there shall be levied, collected, and paid on the goods, wares, and merchandise herein enumerated and provided for, imported from foreign countries, the following duties and rates of duty; that is to say," &c. What stronger or more unmistakable language than the foregoing could be employed to abrogate all prior duties on the articles and manufactures embraced in the act of 1867 without saying in terms that all former legislation on the same subject was thereby repealed?

The authorities are abundant also to establish the doctrine that the language used in this enacting clause repeals all former duties on the articles "enumerated and provided for" in that section. Manufactures of wool of every description, whether made wholly or partly of wool, and woolen knit goods, are mentioned, enumerated, and provided for therein. Hence it is not only "plain as a pikestaff" but good common sense, as well as settled by ample legal authority, that the former duties on these goods were, by the words used in the latter act, repealed.

It has been argued by the distinguished gentleman from Kentucky [Mr. CARLISLE] that because the words "not otherwise provided for" are found in this section they are applicable to woolen knit goods and hosiery; that as to such goods and hosiery previous tariff acts relating thereto were not repealed by the act of March 2, 1867. This view I believe to be utterly unsound. The case of *Smythe vs. Fiske*, in 23 Wallace, 374, decided by the Supreme Court in 1874, is a direct authority against his position. The syllabus of that case, referring to the tariff act of June 30, 1864, wrongly given throughout the case as July 30, (13 Statutes at Large, 210,) is as follows:

The words "not otherwise provided for" mean not otherwise provided for by previous parts of the section of which they make the closing words, and exclude reference to the acts of 1861 and 1862, which laid a duty of but 35 per cent. on "articles worn by men, women, or children, of whatever material made."

Mr. Justice Swayne, who delivered the opinion of the court, says, on pages 380, 381:

The object of the statute was to increase the duties before imposed upon the things which it embraces. The title and the context alike show this. The preceding part of the section contains a very full enumeration of articles of silk, both manufactured and unmanufactured. It was evidently intended to be exhaustive. The last clause seems to have been added, as it is not unusual in such cases, out of abundant caution, that nothing might escape. Hence the phrase "not otherwise provided for" was interposed, and meant to apply not to preceding acts which may not have been present to the mind of the draftsman, and to which there was no necessity to recur, but to the preceding enumeration in the same section, which it supplemented.

The section thus construing this clause covers the whole subject of silk in all its variety of forms. It was complete in itself. There was no need to refer generally or specially to any prior act. If there was conflict the prior legislation yielded necessarily *ipso facto* to the later.

This is a case in point. It appears to me, therefore, after a careful consideration of the terms, scope, and purpose of the act itself, that upon whatever articles or manufactures duties were levied by the tariff act passed March 2, 1867, all prior duties thereon were repealed. Its sweeping and comprehensive provisions, which cover all manufactures of wool of every description, whether made wholly or partly of wool, and particularly woolen knit goods, as being subject to the duties therein levied, and the enacting clause of the section referred to distinctly declaring such duties to be "in lieu of all duties heretofore imposed by law," render it entirely unnecessary to refer to the earlier tariff laws on the subject. All prior tariff laws touching the goods, wares, or merchandise enumerated in the act of 1867 are immaterial to this discussion. In the consideration of the question whether or not a blunder in regard to the duties on knit woolen goods was committed in the revision of the statutes in 1873 we start with the act of 1867, which alone, so far as woolen goods are concerned, should have been put into the Revised Statutes, and the provisions whereof in respect to such goods alone appear in Schedule L, Revised Statutes, page 471, 472.

But the commissioners having charge of the revision, or possibly a clerk employed by them, through some oversight or inattention in the preparation of Schedule M, put into that schedule, instead of putting them into Schedule A, relating to "cotton and cotton goods," as they should have done, the following paragraphs from the tariff act, approved March 2, 1861, which imposed a duty of 30 per cent. ad valorem, from and after April 1, 1861, (increased to 35 per cent. by the act approved July 14, 1862,) on the articles named therein, which, as already shown, had been repealed as to manufactures of wool ever since the tariff act of March 2, 1867, took effect, and which had been repealed as to manufactures of silk and linen ever since the tariff act of June 30, 1864, came in force:

Articles worn by men, women, or children, of whatever material composed, made up, or made wholly or in part by hand, not otherwise provided for.

Caps, gloves, leggins, mitts, socks, stockings, wove shirts and drawers, and all similar articles made on frames, of whatever material composed, worn by men, women, or children, and not otherwise provided for.

Clothing, ready-made, and wearing apparel of every description, of whatever material composed, except wool, made up or manufactured wholly or in part by the tailor, seamstress, or manufacturer.

These three clauses of the tariff act of 1861, found on page 191, in 12 Statutes at Large, reversing the order in which they appear there, and above, constitute the entire paragraph before referred to in Schedule M of the Revised Statutes, page 474, with the exceptions relating to silk and linen, which the revisers inserted. Indeed the 35 per cent. duty laid on the articles mentioned in those three clauses, pursuant to the act of 1861, amended by the act of 1862, was superseded by the act approved June 30, 1864, entitled "An act to increase duties on imports, and for other purposes," by which the duty on all woolen manufactures not otherwise provided for, including ready-made clothing and wearing apparel of every description, made wholly or in part of wool, except hosiery, was fixed at 24 cents per pound, and in addition thereto 40 per cent. ad valorem. On shirts, drawers, and woolen hosiery, or of which wool was a component material, not otherwise provided for, 20 cents per pound, and in addition thereto 30 per cent. ad valorem. (13 Statutes at Large, pages 207, 208.)

I am surprised at the position now taken by the gentleman from Illinois [Mr. MORRISON] and by the gentleman from Kentucky [Mr. CARLISLE] that no blunder in the revision of the United States Statutes of 1874 touching the duty on knit woolen goods, so called, was made. When this bill was before the House a month ago the gentleman from Illinois [Mr. MORRISON] stated as follows:

I believe this article was admitted or placed in the wrong section and classified wrong, unintentionally placed in a class paying but 35 per cent. when it was of a kind to be classed in a different section where they paid about 85 per cent. The court does not say so, but I will have read in this connection what the court did say.

The Clerk read as follows:

"In *United States vs. Bowen*, 100 United States, 513, we held that the Revised Statutes must be treated as a legislative declaration of what the statute law of the United States was on the 1st of December, 1873, and that when the meaning was plain the courts could not look to the original statutes to see if Congress had erred in the revision. That could only be done when it was necessary to construe doubtful language."

"It may be true, as suggested, that if there had been no revision and we had been required to construe the statutes as they stood before December 1, 1873, a different conclusion might have been reached. We have not deemed it necessary to institute such an inquiry."

The extract read by the Clerk is taken from the opinion of the Supreme Court in the case of *Vietor vs. Arthur*, finally decided the 8th of May last; and, although the court did not declare in terms that the blunder complained of, which the bill now before the House seeks to correct, is an error of revision in compiling the United States laws then in force into the Revised Statutes, still the implication is quite strong in the mind of the court, apparently, that such was the only plausible explanation which could be given. We have, moreover, the opinion of the present Secretary of the Treasury, long an eminent judge of the highest court of New York, expressed in a letter addressed May 25, 1882, to Mr. KASSON, of the Committee on Ways and Means, that the error "is undoubtedly one of revision." It is also perfectly clear from the time the "act to provide increased revenue from imported wool, and for other purposes," (14 Statutes at Large, 559,) passed, March 2, 1867, down to June 22, 1874, when the Revised Statutes took effect, a period of seven years and upward, that the pound duty, graduated according to value, as well as the 35 per cent. ad valorem duty was collected on these goods throughout the country, substantially without litigation or controversy.

What new light has appeared to the distinguished gentleman from Illinois [Mr. MORRISON] on this subject since the first Monday in June? Since then he says he has carefully examined the subject and does not now believe that any such mistake of revision was made, and declares as the result of his examination that he finds the revisers left the law as they found it, making no change. He produces a copy of a protest made to Collector Arthur at the port of New York, in September, 1873, against the collection of the higher rate of duties claimed on gloves, wristlets, and similar articles made on frames, &c., protesting that such articles were only liable to duty under section 22 of the tariff act of March 2, 1861, and section 20 of the tariff act of July 14, 1862, at the rate of 35 per cent. ad valorem.

But he omitted to state a fact which he may not have been aware of, that the point now raised by him was judicially determined in a suit which may have arisen out of the same transaction to which his protest relates. I refer to the case of *Krause vs. Arthur*, decided by the United States circuit court for the southern district of New York, at the October term, 1877, wherein it was held that the law in force when *Krause's* cause of action arose (namely, the act of March 2, 1867) did authorize the imposition of pound duties on these knit woolen goods, as well as the 35 per cent. ad valorem duty. That decision was never appealed from, and is valuable as a judicial interpretation of the act of March 2, 1867, upon the point now in controversy.

So it appears that importers of woolen knit goods and hosiery, acting presumably upon the advice of counsel skilled in the law, paid into the Treasury the double duty imposed on such goods from March

2, 1867, to June 22, 1874, without question, and, except in the single case named, without litigation; and in that case rested quietly, without appeal to the Supreme Court, upon a decision against them by the circuit court. A contemporaneous practical construction of the law is frequently of considerable value in the interpretation of its intent and meaning, especially in cases where the language used is susceptible of two or more constructions. I do not admit, however, that the law of 1867 fixing the duties on knit woolen hosiery and other goods is susceptible of two constructions. Indeed, it is quite clear from an examination of the act of 1867 that such goods were in terms made liable to the graded pound duty and the 35 per cent. ad valorem.

Again, the same gentleman and the gentleman from Kentucky [Mr. CARLISLE] both call attention to the fact, as alleged by themselves, that Messrs. Heyl, Morgan, and Ogden, government experts at New York, Philadelphia, and Baltimore, in their books on "tariff and tariff rates," giving the duties on imported goods from 1867 until the present time—before as well as since the revision of the statutes—all mention the rate of duty on knit goods made on frames, &c., as being only 35 per cent. ad valorem. Against this I desire to set off as a full and satisfactory answer the fact of a contrary adjudication in the case of *Krause vs. Arthur*, before alluded to. Also, that at every port in this country where woolen hosiery and knit goods were imported into the United States the Government uniformly collected the compound duty instead of the 35 per cent. ad valorem duty only. Thus the uniform practice of the government in levying and collecting the double duty without objection save in a single instance, and that case a judgment unappealed from in favor of the Government, affords to my mind a conclusive answer to any supposed confirmation of the gentlemen's views which may be found in Heyl, Morgan, or Ogden's tariff books, which I am not prepared to admit.

Indeed, I am surprised to find that both these gentlemen, so far as Heyl is concerned, (and probably the others,) are entirely mistaken. In Heyl's *United States Import Duties*, published in 1877, the knit goods made on frames, &c., referred to by both gentlemen as being subject to only a 35 per cent. duty, were cotton goods, and not those made wholly or in part of wool. They evidently were misled by what is found in the schedule of duties on page 4 of part 2, while the act of March 2, 1867, on pages 93 to 97 inclusive, is given as being in full force at the time the book was published, and on page 78 of the schedule of duties, in part 2, woolen knit goods, including hosiery, &c., the pound duty graded according to value, as well as the 35 per cent. ad valorem, is given.

The gentleman from Kentucky, [Mr. CARLISLE,] who took no part in the discussion on this subject the first Monday in June, declares that the claim set up in the report of the Committee on Ways and Means, and in the speeches of gentlemen on the floor of the House, that the act of 1861, so far as it related to woolen hosiery made on frames, &c., was repealed either by the act of 1864 or by the act of 1867, is wholly without foundation. Mr. CARLISLE argues the act of 1861 was modified but not repealed by the act of 1864, and was in full force when the revision of the statutes was made, and if the revisers had undertaken to except woolen hosiery and knit goods from the provision in Schedule M they would have been changing the law instead of merely revising it. I think I have already made sufficiently plain the error of the gentleman, and have shown that the act of 1867 embraced all the duties on woolen knit goods from that time to the mistake in the revision of 1873.

The same gentleman also argues from the various tariff acts from 1842 down to the revision of the statutes in 1873 that the provision relating to knit goods made on frames has been preserved, and claims that there is no such error in the revision as the Secretary of the Treasury suggests and the report of the Committee on Ways and Means shows. The expression "made on frames" has no practical significance at the present time. The frames on which knit goods and hosiery were made thirty or forty years ago are no more like the machines on which such articles are now made "than a hawk is like a hand-saw." Knit goods are now chiefly made on circular knitting machines, sometimes called heads, which have been invented within the last twenty or twenty-five years. Hence the expression "made on frames" has long been obsolete.

What sound reason can anybody give for imposing a duty of only 35 per cent. ad valorem on knit goods made on frames and imposing the same duty and a pound duty besides on knit goods not made on frames? There is no distinction between the two classes of knit goods; none has been pointed out; none exists in fact. The protection desired is equally necessary to both classes, whether knit on frames, needles, or otherwise.

I cannot help thinking the distinguished gentleman from Kentucky [Mr. CARLISLE] has fallen into a grave error both in his examination of the important provisions of the acts approved June 30, 1864, and March 2, 1867, and the decisions of the Supreme Court of the United States upon the subject.

The gentleman from Illinois [Mr. MORRISON] alleges that if the pound duty is also imposed upon the goods provided for by this bill, besides the 35 per cent. ad valorem, they will be subjected to the high rate of 85 to 100 per cent. duties, and the gentleman from Kentucky, usually so accurate in his suggestions, also maintains that by amending Schedule M in the Revised Statutes by inserting the word "wool" in the two places referred to the duties on these goods will be in-

creased to not less than 85 per cent., and it may be to over 100 per cent. ad valorem, according to the quality and value of the goods. I desire to emphatically controvert these statements touching the amount of duty thereby imposed upon this class of goods. The gentlemen have made a blunder in their calculations. There is a misfit somewhere in their figures, and against the two gentlemen who substantially make the same statement I will cite Mr. Spofford, the accurate author of the *American Almanac*, who in this instance certainly shows his superiority in arithmetic to both. On page 83 of the *American Almanac* for 1882, Mr. Spofford says the duty on hosiery worth over 80 cents per pound, being a pound duty of 50 cents and 35 per cent. ad valorem, the whole reduced to an ad valorem standard amounts to a fraction less than 56 per cent. duty. Shirts, drawers, &c., worth over 80 cents per pound, reduced to the same standard, will pay a duty of a fraction less than 68 per cent.; so that the entire duty imposed or collected, both specific and ad valorem, does not exceed 68 per cent., and may be as low as 56 per cent., or a general average of 62 per cent. A little inaccuracy of only about 25 per cent. in the statements of the gentlemen in this particular may be worthy of correction.

If this bill does not pass, the duties on woolen hosiery and knit goods are 20 per cent. less than on most of the crude wool imported from which they are made; in other words, duties on the manufactured article are 20 per cent. less than on the raw material out of which they are made. Does Congress want to discriminate against American manufacturers of knit woolen goods and in favor of foreign manufacturers to the extent of 20 per cent.?

Again, both gentlemen aver in substance that the profit on the manufacture of these knit goods in 1880 was 47 per cent. on the amount of capital invested. I quote from the remarks of the gentleman from Kentucky, [Mr. CARLISLE,] taken from the *RECORD* of July 6, page 18:

According to the last census report the total capital invested in the manufacture of these goods in 1880 was \$15,133,991, and the value of the product was \$28,613,727. The whole cost of labor was \$6,530,576, and the whole cost of material used in the manufacture was \$14,954,199, making a total of \$21,484,775 for labor and materials. The excess of the value of the product over the total cost of labor and material was \$7,128,952, or 47 per cent. on the whole amount of capital invested. If this capital of \$15,133,991 had been loaned at 6 per cent., which is about twice as much as the farmers of the country receive annually on their investments, it would have yielded an income of \$908,039.46; but being invested in the manufacture of hosiery and knit goods, and being protected at the expense of the consumers by high rates of duty, it in fact yielded, as already stated, \$7,128,952, or nearly eight times as much as the usual legal rate of interest on money.

Now, the statistics from the Census Office, showing the product of this industry for 1880, are given in totals, as follows: Amount of capital invested in 354 establishments is \$15,133,991; amount paid out for wages, \$6,530,576; value of the materials used, including wool, \$14,954,199. The labor and materials together make \$21,484,775; that deducted from the value of the product for 1880, which is \$28,613,727, leaves \$7,128,952. The last-named sum is treated by both gentlemen as the profit made by the manufacturers of these goods upon their investment of capital of \$15,133,991.

But this statement falls far short of giving the exact truth in regard to net profits. Out of the \$7,128,952 which, as the gentlemen say, represents about 47 per cent. of the invested capital, must be paid a heavy annual expenditure for renewals and changes in machinery necessary to keep up with the ever-varying styles of goods required for the markets. Every separate style of goods requires a new machine, and many styles of hosiery go out of fashion and come into fashion every year. Also, a considerable outlay is necessary for the wear and tear of the machinery. Good judges estimate this item alone costs manufacturers on an average 12 per cent. of their capital. The machinery is costly, of delicate construction, and needs frequent repairing or replacement with new machinery. No account of this item is taken by either of the gentlemen. A deduction of 12 per cent. probably should be made for this item, which would be \$1,815,982.

Again, I have it upon excellent authority that the cost of disposing of the goods manufactured—commissions on sales—is a large item of expense to the proprietors of these mills. Ten per cent., I am informed, is not an extravagant sum to reckon as the cost of selling the annual product, including the proprietor's time, his losses by bad debts, payments for insurance, &c. Ten per cent. on the annual product of 1880 is \$2,861,372. This, with the other deduction of 12 per cent., leaves only \$2,451,598 as compensation for the rental of fixed and permanent capital valued at \$15,133,191, which leaves no such enormous profit as 47 per cent. on the capital invested, as both gentlemen have represented. Indeed, it is a business requiring skill, diligence, and close attention in order to insure any profits to the manufacturer.

Stimulated and encouraged by the protection afforded under the tariff act of 1867 and prior acts, many business men have engaged in the manufacture of woolen knit goods, and owing to competition among them and the invention and use of new machinery the price of woolen hosiery and other knit goods has largely been reduced. Consumers do not pay one-half what they did for the articles fifteen or twenty years ago. Mr. George C. Bosson, of Boston, Massachusetts, a very intelligent and extensive manufacturer, gave the following testimony before the Ways and Means Committee:

There is no industry in the country producing textile fabrics in which so large

a proportion of its value is represented in cash paid for labor as knit goods. And there has been no industry started here that has done more for the preservation of health and the prolongation of life than knit goods, because we put it within the reach of every individual to provide himself with comfortable underclothing. We furnish the laboring-man with a comfortable woolen undershirt, drawers, and socks, all three, for \$1.12.

Besides, crude wools imported and used in the manufacture of knit goods and hosiery pay a duty of 46 to 55 per cent. ad valorem. It would be singular if Congress, or any other body of sensible men in this country, should purposely impose a much higher duty on raw material like wool than on the manufactured article like what is now claimed in respect to imported woolen hosiery and knit goods.

Now, then, the mistake or blunder has been made and we are asked in the interest of a large number of the American people to correct it. The men, women, and youths at work for remunerative wages in the two hundred and fifty odd knit-goods establishments scattered throughout nineteen States of this Union are interested in the continuance of the business which affords them the means of livelihood and gives them employment from day to day. The farmers, who dispose of more than nine million pounds of wool per annum to these various factories, desire a continuance of the market thus afforded for the product of their domestic animals. Why not correct it? What class or interest in the country calls for or demands that the effect of this blunder should be continued?

None but a free-trade class or interest; none but those interested in the importation of goods manufactured in foreign lands by foreign workmen with foreign capital, and imported here in foreign ships, ask for it. What is our duty here as Representatives? To legislate

in the interest of our own people, or in the interest of foreign manufacturers, foreign laborers, and foreign capital? A bare statement of the proposition ought to be sufficient to influence every candid mind in favor of this bill, irrespective of political considerations or of abstract notions concerning the doctrines of free trade or protection. The gentlemen who oppose the correction of the blunder and who are willing to see an interest built up in our country under a protective tariff of the magnitude of the hosiery and knit goods business in the United States crippled or sacrificed, assume and argue in the same breath with their opposition to the bill that the tariff commission will do nothing to revise and reform our tariff; that it is a mere make-shift and subterfuge invented by the protective-tariff men for delay.

I find in this argument, if there is any truth in it—if the effect of the tariff commission shall be what these gentlemen predict—an additional and stronger reason why we should act promptly and speedily for the benefit of our constituents, whose business interests have been so seriously imperiled by this mistake. I believe, sir, that the tariff-commission bill was in the interest of the people of this country, that it will prove of value to the American Congress, and will aid them largely in a proper revision of our present tariff laws. But if it were not so, as before stated, then a double reason exists for us to correct this error in behalf of the worthy and respectable and thrifty business men scattered all over our country who have invested their capital and have devoted their brains to the building up of a large industry and who are as much entitled to respectful consideration here as any class which ever came before Congress for relief.

APPENDIX.

Hosiery and knit goods. (From Census of 1880.)

Letter from J. W. Busiel & Co., of Laconia, New Hampshire, to Hon. H. W. Blair.
 LACONIA, NEW HAMPSHIRE, April 16, 1881.

DEAR SIR: We desire to call your attention to a recent decision of the United States Supreme Court by which the duty on hosiery has been changed so that it now stands at 35 per cent. ad valorem. This change means ruin to our hosiery industry in this country, inasmuch as it reduces the duty from fifty cents per pound weight and 35 per cent. ad valorem to a simple ad valorem duty of 35 per cent. An examination of the annual reports of the Chief of the Bureau of Statistics shows that the average duty on fine wools, or class I under Schedule L, equals 70 per cent. This decision makes the duty on all knit goods made of wool by machinery 35 per cent. ad valorem. Supposing all goods were honestly invoiced at a full foreign valuation, and leaving out of the question the difference in the cost of labor and interest on capital, there is a premium of 35 per cent. in favor of the foreign manufacturer on all the wool of which such goods may be made. To state a special case it would be as follows: cost to an importer of a stocking weighing two pounds, value \$3 per dozen, under Schedule L of tariff before decision was made, \$5.05 per dozen; cost of same stocking under the decision just made \$4.03. In other words, the decision has reduced the tariff on stockings \$1 per dozen; on shirts and drawers the reduction amounts to \$4 to \$8 a dozen according to the weight of the goods. Such a reduction is ruinous to Laconia, Meredith, Belmont, Tilton, Franklin, Lake Village, and hurts Manchester severely. It strikes many other towns in the State very hard. It strikes in Massachusetts, Ipswich, Needham, Waltham, Ware, Grantville, and many other places. It strikes in Connecticut very large manufacturing interests, and in New York and Pennsylvania the interests are enormous. We simply give you a rough idea, but you can get a pretty clear insight into the importance of the industry threatened by the statement that can be verified we think without much labor of the number of sets of cards employed on hosiery. The aggregate of all kinds of woolen cards at work in this country is now between eight thousand and nine thousand sets; of these the hosiery industry is thought to employ 1,700. The Census Bureau can easily set right any errors in our estimate, but we give you the estimate of good judges.

As the matter now stands we have got to go to Canada in order to manufacture. Wool that costs us ninety-five cents here we can get there and work there at a cost of forty-five cents and can afford to pay the duty of 35 per cent. on goods so made and sell at what the goods cost us here, and in so doing make a better profit than

we are now getting. New Hampshire maintains by her hosiery industry many thousands of her people; many of these came from Canada and would very gladly go back if mills should be established there, as they certainly will be if this decision were to stand. It is unnecessary for us to say much to you about the importance of the matter, as you are where you can get information so easily, but there is no doubt that some fifty million dollars is now employed in hosiery in the mills, stock, and capital used.

We see no remedy that can be applied save an extra session of Congress to set the matter right, and certainly every hour that passes without a remedy is working great mischief to our trade all through the country and will paralyze it completely within twelve months. No man will dare to operate in face of this decision beyond his immediate orders, and hence the future is all uncertain to us. We must have relief, and that speedily, or much suffering will surely result. If not a pre-sumption on our part, we ask you to confer with the Senators from New York, Pennsylvania, Massachusetts, Connecticut, Illinois, Ohio, Maine, Vermont, and New Jersey, which are directly and heavily interested in this matter. If we go a step beyond our industry to the raising of wool you need add to our list above California, Oregon, Texas, Virginia, West Virginia, Wisconsin, Indiana, Nevada, Louisiana, in short every wool-growing State. As cotton enters largely into some grades of our goods we need only to refer to this to show that every Southern State is interested in the decision by its depressing effect upon the price of cotton. Wherever we have used the term "hosiery" it would have been more correct to say knit goods, as that is the idea we have in mind, and without changing that in our letter we desire to have it so understood.

Before closing we desire to say that the knit-goods industry in New Hampshire has nearly doubled in the last ten years, and if value of product is taken as a basis it has more than doubled.

If there be any method of action that you can suggest to us we shall be glad to avail ourselves of it. There is a great commotion among the manufacturers, who are as yet not concerted in their action, but are preparing to unite and present the matter with whatever power they are able to command. We see it intimated that the circular instructions may be suspended to await action of Congress. Of course, this may help us out until then. We trust you will favor us by giving it your attention, and much oblige,

Yours truly,
 Senator H. W. BLAIR.

J. W. BUSIEL & CO.

Election Contest—Lowe vs. Wheeler.

SPEECH

OF

HON. GEORGE C. HAZELTON,
OF WISCONSIN,

IN THE HOUSE OF REPRESENTATIVES,

Saturday, June 3, 1882.

The House having under consideration the contested-election case of Lowe vs. Wheeler, from the eighth Congressional district of Alabama—

Mr. HAZELTON said:

Mr. SPEAKER: The Constitution ordains that each House of the American Congress shall be the judge of the elections, returns, and qualifications of its own members. This constitutional power upon which there is no limitation, a power absolutely essential to the independence and purity of the law-making branch of free governments, did not originate with the fathers of the Republic, but far back in English history in the great struggles for freedom between the Commons and the Crown.

It is a power absolutely necessary to be exercised in order that this body may represent what it ought to represent, that it may contain what it ought to contain, the honestly-elected representatives of the American people. No stuffed ballot-boxes can stand in the way of its exercise; no dishonest inspector of election can defeat its purpose; no governor's certificate usurp its power or dictate its action; no rule of this House can stand in the way of its exercise by this great Congress of the American people. It knows no master but the American people.

In the exercise of that sovereign power we come here to-day to pass judicially upon this contested-election case coming from the eighth Congressional district of the State of Alabama; to decide honestly and fairly, and upon all the evidence and upon all the law, which of these two gentlemen, the contestee, Mr. Wheeler, or the contestant, Mr. Lowe, is entitled to the seat in controversy. In other words, we come here to determine the honest will of the people of that Congressional district, and we come to its consideration in the light of justice and of fairness, and under the obligation of our oaths as members of this great legislative body.

This happens to be one of those cases where no man can charge that we are influenced by any partisan prejudice or bias. We are passing upon a case where one man is a Greenbacker and the other is a Democrat of the Bourbon school in this country.

We make no attack upon the character of either of these men. We concede, for the purposes of the discussion of this case, that they are both honest and respectable. We are contesting a question where the will of the people is involved, and undertaking to determine which of these two men should sit here to represent the people of that Congressional district.

The testimony in this case is voluminous, amounting to about 1,500 printed pages. Able arguments have been made on both sides by learned and distinguished attorneys. The committee have taken a long time to investigate this case, and have tried hard to reach a just conclusion. In this discussion thus far before the House questions have been raised that have no pertinency to the real issues involved, that are not in the case at all. The gentleman from Illinois [Mr. SPRINGER] fancies that he has made a great discovery and pushes forward into the arena of debate to announce it to the House and to the country. He charges that many of the Lowe ballots were tissue ballots and were rejected by the inspectors on that account. The charge has no foundation whatever in the whole testimony of the case. I challenge the gentleman to find the testimony in the case that will warrant or sustain the declarations he has made in this regard. Now and here for the first time that question has been raised even in the investigation or the adjudication of this case from the beginning to the end.

Mr. SPRINGER. Will the gentleman allow me to make a statement?

Mr. HAZELTON. Yes.

Mr. SPRINGER. In the argument of Mr. Paine, on page 11, the argument submitted by him to the committee, fac-similes of this ticket were produced, and the argument was in favor of rejecting them.

Mr. HAZELTON. You have said that two or three times, I believe. I will come right to the issue, and if I am permitted to do so I will show that there never was a tissue ballot thrown out of a box in that district on the ground that it was a tissue ballot, not one; and I will show you, furthermore, that there is no evidence of any one man having cast two tissue ballots, or any man casting over one ballot that was counted for Mr. Lowe in this entire election contest.

And when you come here and raise the question of tissue ballots, then I will come back to you and say that, while you on that side may understand all about tissue ballots, this is not that class of ballots, not a ballot made on a scale of small dimensions, with fine print and on the thinnest kind of tissue paper, where very many could be folded up together and put into the box and be counted, as they have been counted in some cases, so as to affect the result and utterly subvert the will of the majority.

A ballot has been brought in here, but not a ballot which was rejected because it was a tissue ballot. And the very ballot brought in here and exhibited by my friend from Illinois [Mr. SPRINGER] is not one of the original ballots which have been presented in proof, and cannot be claimed as a tissue ballot within the meaning of that term.

The ballot presented here may be a ballot on paper thinner than some other paper, but it is on paper thick enough to receive the imprint of the names of the candidates, thick enough to be within the law of every State so far as the texture of the paper and the character of the printing are concerned. I will show you hereafter the ballots as cast and received, and they will speak for themselves.

Before I go further with that, however, let me state the situation of this case for the benefit of members of this House. On the certificate as it came from the secretary of state of Alabama, Mr. Wheeler was declared elected by 43 majority. The vote is stated 12,808 for Mr. Wheeler and 12,765 for Mr. Lowe; giving Mr. Wheeler upon the statement of the secretary of state 43 majority.

The votes as cast and received, as admitted by the counsel for the contestee, and as shown beyond all cavil and all question—the votes as cast and received by the inspectors of election in that district were for Mr. Wheeler 12,808, and for Mr. Lowe 13,390; giving Mr. Lowe 482 majority. We claim that, taking into consideration other items, the real majority is 847 for Mr. Lowe.

But for the purpose of the argument and the decision in this case, accepting only that which is undisputed, that which stands beyond cavil, we say that taking the votes which should have been counted and returned, Mr. Lowe must be declared to have been elected by 482 majority; the lowest estimate that could be made—

Mr. WHEELER. Will the gentleman allow me one word?

Mr. HAZELTON. Certainly.

Mr. WHEELER. You are mistaken about its being conceded; it is denied. The counsel simply say it is alleged so and so.

Mr. HAZELTON. All right; you are welcome to the benefit of your statement. Now, I ask why were these votes thrown out? Why do these great volumes of testimony which I have here before me show that these inspectors of election cast out the number of votes which we claim were received by Mr. Lowe? It was done by this method: first, it was claimed that under the law of the State of Alabama the inspectors of election under their oath were called upon to throw out that class of votes. Now, the law of Alabama is this:

That section 274 of the code of Alabama be amended so as to read as follows: The ballot must be a plain piece of white paper, without any figures, marks, rulings, characters, or embellishments thereon, not less than two nor more than two and one-half inches wide, and not less than five nor more than seven inches long, on which must be written or printed, or partly written and partly printed, only the names of the persons for whom the elector intends to vote, and must designate the office for which each person so named is intended by him to be chosen; and any ballot otherwise than described is illegal and must be rejected.

Now, I will take one instance to illustrate the declaration which I am making here, and to illustrate the methods which were used by the inspectors of election under that law in order to throw out this column of votes which belonged to Mr. Lowe. One of the inspectors of elections was sworn, and his testimony will be found on page 47:

Question. When did you first hear a suggestion that the Greenback Lowe ballot containing the numerals should be rejected?

Answer. That night when we commenced to count, in a few minutes after we had commenced it.

Q. From whom did you hear it?

A. I heard it from the inspector, Captain McGehee.

Q. What did he say?

A. Well, I would have to detail the circumstances to show what he did say. We commenced the count, and right at once we struck on those tickets, and McGehee said he thought they were illegal on account of the numerals on the side of the ticket, and that was after we had counted two of them; and then we passed the matter over until afterward, and that was about all I heard about the tickets being illegal at that time; but in counting the ballots we took all of those tickets and laid them one side, and the reason why we laid them one side was because they were scratched or split tickets, or Greenback tickets. All were laid in one pile.

Q. Now, in the count which of these tickets laid aside were counted and which rejected?

A. I don't know. Yes, I do; we counted all of the tickets in the above pile, except those tickets that had numerals on the side.

Q. How many of those tickets having numerals on the side were for Colonel Lowe?

A. Sixty-one.

And so it is throughout all this testimony, wherever you go and find the number that was thrown out in the different precincts you find that every one of them, amounting to 535, was rejected on that ground—was rejected under the law which I have read—because of numerals on the ticket, which it was claimed violated that law and vitiated the ballot itself; the merest subterfuge.

Now, sir, these men had notice, every one of these inspectors who threw out these different precincts, that under the law they must throw them out, whether it was right or wrong. So far as I can ascertain, (and I have examined the proof in this case, and I think it shows it very clearly,) that intimation came from the central Democratic committee of that district. It is a little marvelous when you look at this notice, which was called the "yellow circular" in that district, and see how it reads. This is the circular:

DEAR SIR: As soon as the polls are closed inform the inspectors of the election that the Lowe tickets with Hancock electors on them are illegal. They contain the figures 1st, 2d, &c., designating the district. These are marks or figures which are prohibited by the election laws; see acts 1878-9, page 72; and all such tickets should be rejected when the votes are counted after the polls are closed.

Now, I challenge any man from the eighth Congressional district of Alabama to show to me, or to convince any honest jury of his countrymen, that this whole scheme to strike out 500 ballots which represented the sovereign will of 500 voters, was not concocted and directed by the central Democratic committee of that district.

This yellow circular was printed in the papers of this district. It was brought down to the polls on the evening when they were met to count the vote. This inspector swore, the same inspector to whom I have before alluded, that it was on that very evening they had the first intimation this law was to be enforced as directed by this infamous circular.

Now, Mr. Speaker, that circular was indorsed on the back "to be shown only to very discreet friends," and the discreet friends who received it were the friends who obeyed its mandates and struck down more than 500 votes, which gave Mr. Lowe a straight honest majority in that district.

Mark how this sovereign will of the real and true majority of that district was wiped out, and how the minority was made to usurp its true power and place; how the dictation of a partisan circular, how trick manipulation and fraud deprived the citizen of that district of the most sacred of all his rights as a free man—his right to vote and have that vote honestly and fairly counted, certified, and returned, so that it should have its true force and effect upon the law-making power of this nation. The inspectors rejected in the count the tickets which read as follows:

FOR ELECTORS FOR PRESIDENT AND VICE

PRESIDENT:

STATE AT LARGE.

W. L. BRAGG.

E. A. O'NEAL.

DISTRICT ELECTORS.

1st District—D. P. BESTOR.

2d District—JOHN A. PADGETT.

3d District—J. F. WADDELL.

4th District—JOHN ENOCHS.

5th District—THOS. W. SADDLER.

6th District—J. G. HARRIS.

7th District—F. W. BOWDON.

8th District—H. C. JONES.

FOR CONGRESS—EIGHTH DISTRICT.

WILLIAM M. LOWE.

FOR ELECTORS FOR PRESIDENT AND VICE

PRESIDENT:

STATE AT LARGE.

JAMES M. PICKENS.

OLIVER S. BEERS.

DISTRICT ELECTORS.

1st District—C. C. McCALL.

2d District—J. B. TOWNSEND.

3d District—A. B. GRIFFIN.

4th District—HILLIARD M. JUDGE.

5th District—THEODORE NUNN.

6th District—J. B. SHIELDS.

7th District—H. R. McCOY.

8th District—JAMES H. COWAN.

FOR CONGRESS—EIGHTH DISTRICT.

WILLIAM M. LOWE.

Over five hundred ballots like these the inspectors of the election rejected because they contained the numerals 1st, 2d, 3d, &c., as they appear thereon before the word "district;" and there was only a margin then for Wheeler of 43 majority, upon which he received the certificate of the governor of the State; and when I state, what the testimony clearly shows, that these inspectors were compelled, in order to save Wheeler at all, to count and return over fifty votes cast for him which were illegal and void under their theory of the Alabama law because they contained a numeral or numerals upon them, it furnishes an illustration of the real character of these election managers more fitting than any words within our language could give. But, sir, those Wheeler votes were not included within the mandate of the yellow circular sent out by the Democratic managers, and they were accordingly counted for Wheeler.

For twenty years, Mr. Speaker, Alabama has been casting votes on both sides precisely like these Lowe tickets which were rejected. We have them here, as shown in these volumes of testimony, running back for twenty years; and yet when this number of tickets came up from the sovereign will of that people, whether poor or rich, and went into the ballot-box, when these tickets were so cast and honestly and fairly received, those which had numerals on them for Lowe were struck down, while those for Wheeler which had numerals on them were counted and returned.

Mr. WHEELER. I ask the gentleman from Wisconsin to explain the difference between them.

Mr. HAZELTON. Any one that had a number on it, according to your construction of the law, broke that ticket to pieces. Just as it was in the State of Mississippi, where a little dash on a ticket broke it down and rendered it invalid. A mere printer's dash between the great names of Garfield and Arthur was sufficient under the construction given to the law by the inspectors of elections of that State and the decisions of their courts to strike down those ballots, however honest the voter may have been who cast them.

Mr. WHEELER. Will you not state that there is nothing in the answer of the contestee, or in the proof, or in the argument insisting on anything of that sort?

Mr. HAZELTON. Insisting on it?

Mr. WHEELER. Yes; that figures made it illegal.

Mr. HAZELTON. This is the circular; let it answer you. Here is the circular which commanded your inspectors to strike them down. [Laughter and applause.] For what? Where they contained figures 1st, 2d, 3d, &c., designating the districts. After the polls were closed what did you do? Every one of your inspectors did strike them out according to that order contained in the yellow circular. Every one of them so swears in this testimony, but I cannot now go through it. I can give you the names. Every one of them swears that those tickets were rejected for having numerals upon them, and nothing else in the world. The point as to tissue ballots was never made in the whole contest. You never made it?

Mr. WHEELER. No.

Mr. HAZELTON. Because your tickets were as large as his, and his were as large as yours, and you both got the best paper you could and had them printed and cast. But the only trouble is this: the reason which struck down this number of votes cast for Lowe should precisely, under the same condition of things, have struck down the votes which were cast for Wheeler. But such was not the fact. They threw out the Lowe votes and counted the Wheeler votes.

Now, sir, the pages of the record which I will give show that every one of these witnesses who testify at all on this point swears that they struck out and rejected these ballots because they contained the numerals, and for no other purpose whatever. The pages are, 302-5, 338-341, 349-351, 352-362, 101-2, 1226-7-8, and I challenge the gentleman from Illinois to a prudent husbandry of his time and resources. I challenge him to-night to take this record and these witnesses that I can point out, and that have testified in this case, and he cannot find a word of substantial testimony that places the rejection of these votes upon any other ground than that I have given here, to wit, the existence of these numerals upon them.

It is a part of this great method adopted by this Bourbon party to maintain itself in this country and in the South. It is perfectly legitimate under their purposes and for carrying out their intentions. Why, we all know that the power which was lost on the battlefield it was attempted to gain by these methods which I am recounting, and which I condemn. Reconstruction was rapid in this country, considering all the circumstances. Rights forfeited by rebellion were restored by our Government quicker than it had ever been done before in the history of nations under amnesty, under forgiveness to those who had rebelled and waged war. But that power, when restored, meant an honest ballot and an honest vote. It meant the assertion of the honest will of the people in these States.

First, then, the Kuklux, whose weapons were murder and intimidation, struck them down. That was one method. Then came the tissue ballot, making its way from Mississippi over the States of the South. That was another method. Then came another method, in which courts and Legislatures and all the Bourbon party united. What was that? To create a system and web of law by which the partisan inspectors of their elections could, under their pretended forms of law, destroy and wipe out the same great sovereignty which they feared. Where do you find these men and methods? Texas comes with a statute in which she says if a name is inserted for my

brother JONES, for example, it must be in BLACK INK on the ticket. And then when it comes around to the partisan inspector of the Bourbon school he looks at it and says, "I think that looks a LITTLE too red, and we will throw that out." The mere color of the ink to be left to the judgment, to the eye of the man who has to count the ballots!

Mr. HOOKER. Let me ask the gentleman if I understand him to say that the tissue ballots come from Mississippi?

Mr. HAZELTON. I understood so, and have been misinformed if it is not the case.

Mr. HOOKER. I do not think the gentleman will find it so if he will examine.

Mr. HAZELTON. Well, a good many things come from Mississippi, and my friend is not the worst of them.

Mr. HOOKER. I hope you will give me time to answer the assertion as well as some of the other things that have been said by gentlemen on that side about Mississippi.

Mr. HAZELTON. That is what Texas did. I do not know that I blame Texas; but the Bourbon party in Texas was strong and I cannot understand—I may be mistaken—but I cannot understand or interpret that provision of the law in any other way than from an intention to control the elections independent of the will of the voters. I am unable to place any other interpretation upon a law which says that if my name comes in for Congress on a ticket of a voter who desires to support me for that office, and which says that vote must be absolutely in black ink, that the inspector, if it is a qualified vote in every other respect, if he is a citizen of the State and of the United States, if under all law and all constitutions of the State and Government he has a right to cast it for me, that the inspector has the power to wipe out the sovereign will of that voter at the ballot-box by simply saying that ink in which the name is printed is too nearly blue, and I will throw it out.

You go down and take Alabama. Here is a law which says if I put 1, 2, 3, and so forth, on the ballot, if five hundred of us, tax-payers and citizens of that State; if a thousand of us, honest, straightforward, loyal men of the State, put 1, 2, 3 on our tickets it invalidates our votes and destroys our sovereign will in the law-making executive power of that State and of the government. Now, legislation does that, and it sets aside their own law for twenty years past; and is not the purpose manifest? The sacred bill of rights of Alabama was grand in its assertion—

Mr. BUCHANAN. Will the gentleman allow me to interrupt him a moment?

Mr. HAZELTON. Not now. I say the bill of rights of Alabama was grand in its assertion that the State and the Legislature may make laws to protect the ballot; it never intended the Legislature should make a law to strike down the ballot, and for the first time in this period or for the third time, I might say, in this systematic scheme of maintaining the Bourbon power in the South, and for maintaining the solid South, they reverse the whole policy of the law of the State in regard to the ballot, and hinge that mighty power of the freeman upon a punctuation mark or a numeral.

Under that clause of the election law which provides that the ballot must be "not less than two nor more than two and one-half inches wide, and not less than four nor more than seven inches long," although expressing the clear intent of the voter, and although a substantial compliance with the statute, they draw their construction so fine as to place the ballot under the actual test of the tape-line and yard-stick, and condemn and reject the same for the variance of the smallest fraction of an inch in length or breadth from the technical dimensions prescribed by law. I quote the following from page 124 of the record that the House may see how skilled in this kind of political legerdemain the Bourbon inspectors of this election were in dealing with tickets cast for Mr. Lowe:

Question. Have you now in your possession the Lowe tickets that you refer to as being too short?

Answer. I have; yes, sir.

Q. How much less than five inches are they respectively?

A. No. 1 is a sixteenth short on both edges; No. 2 is a sixteenth short on both edges; No. 3 is a thirty-second short on both edges; No. 4 is a thirty-second short on both edges; No. 5 is a sixteenth short on both edges; No. 6 is a sixty-fourth short on both edges; No. 7 is a sixteenth short on both edges; No. 8 is a sixteenth short on both edges; No. 9 is a sixteenth short on both edges; No. 10 is a sixteenth short on both edges; No. 11 is a thirty-second short on one edge, and five inches on the other; No. 12 is a sixteenth short on both edges; No. 13 is a thirty-second short on one edge, and full length on the other; No. 14 is a sixteenth short on both edges; No. 15 is a sixteenth short on both edges; No. 16 is a thirty-second short on both edges; No. 17 is long enough on one edge, and lacks a thirty-second on the other; No. 18 is a sixteenth short on both edges; No. 19 is a sixteenth short on both edges; No. 20 is a thirty-second short on both edges; No. 21 is a fourth short on one edge, and a sixteenth on the other edge; No. 22 is a sixteenth short on both edges; No. 23 is a sixteenth short on one edge, and a thirty-second on the other.

Q. Please place those tickets in an envelope, seal it, write your name across the seal, and make it Exhibit No. — to your deposition.

A. I have done so.

Q. Would you have rejected those tickets if you had discovered their real length while counting them?

A. I would; had they been for Wheeler, Colonel Lowe, or anybody else.

Q. Did you sanction and approve the rejection of the Greenback-Lowe ballots?

A. Yes, sir; I did.

Q. Do you still sanction and approve their rejection?

A. I do, upon my construction of the law.

You turn your attention for a moment to my friend's State of Mississippi. They have a law lately enacted, and substantially the same as this. They are advancing toward a new order of things. A

ballot voted in good faith by 10,000 men, enough to constitute an army of defense for a nation, tax-payers of your district, citizens of the State and nation, entitled under its Constitution and laws to a voice in all its political, representative, and administrative power, near and remote, may be set at naught by the caprice and at the partisan will of the inspector of elections. We have already seen what course was pursued in a noted case from that State by the election inspectors, which this House condemned by awarding the seat to Mr. LYNCH.

The inspectors raised the point that there is a dash between two names, a printer's dash. Then, first, who cast the tickets? Republicans. Second, for whom did they vote? Republicans. And then the dash becomes a distinguishing mark between the first two names that invalidates that great act of the sovereign voter under the law.

Then you submit this construction to the supreme court of Mississippi, as if that court of Mississippi could stand in the way of the mighty power of this Congress, or the mighty power of the Republican party that holds the issues of the nation in its hands; as if they could say to us "You shall not reach down to Mississippi and take by the hand the honest voter and say to him 'we will recognize your sovereign will in the make-up of this great Congress.'" They submitted it to the court, and the court indorsed the construction and the act of the inspector; a partisan court, for I tell you, sir, no Marshalls, no Storrs would ever give such a construction to that law or strike down the ballot of a freeman for such a reason.

I can but contrast this court with the judge whose findings in another case that has been lately before this House fearlessly found judicially that a ballot-box had been tampered with by a board of county commissioners, although of his own political party. But these judges in the State of Mississippi wearing the judicial ermine, supposed to have the interests of the great people at heart, supposed to be judges who would give such consideration and interpretation to the law as would give the sovereign vote of that State expression wherever it ought to be expressed—they decided that a printer's dash between two names, a punctuation mark, a colon or period, absolutely necessary in the printer's art and trade, should strike down the sovereign will of every Republican voter. Why, sir, under the very logic of the Mississippi court a house-fly can overwhelm the sovereignty of a State. And an army of flies can beat an army of voters. [Laughter.]

But I must pass on because we want to take the vote, and I come to the second branch of this case. It is not a difficult case to understand, because, if the Lowe votes of which I have spoken remain in, if they had been received and counted as they were cast, then Mr. Lowe was elected by a column of votes that cannot be shaken.

How does my friend from Alabama undertake to sustain himself against that position? Why, he comes here and says that there were a large number of voters that were not registered, and that under the constitution and the laws of Alabama those voters whose names were not registered were illegal voters, and he has a right to take them out and offset them against this column in favor of Lowe. This point was raised for the first time after this contest reached Congress. It was an after-thought, and an invention which came when they had an idea that perhaps the Committee on Elections would not adopt their views, and would reinstate those five hundred and odd votes in favor of Lowe, which would elect him.

They claim that under the constitution of Alabama, without any law, they are entitled to strike down every vote cast by those whose names were not registered at the time they voted. I cannot so interpret the constitution of that State. The constitution of Alabama, article 8, section 5, provides:

The General Assembly may, when necessary, provide by law for the registration of electors throughout the State, or in any incorporated city or town thereof, and when it is so provided no person shall vote at any election unless he shall have registered as required by law.

Now, my construction of this provision was and is that registration could not be made a prerequisite to voting unless it existed in the law itself creating the registration.

I can see nothing in the language of the provision to warrant any other conclusion. If the framers of that instrument had intended to make registration a constitutional condition precedent to the right to vote they could and would have said so in plain, direct, and unequivocal language. Such a constitutional condition upon suffrage exists in but very few of the constitutions of the several States of the Union—in the constitution of Florida, and perhaps one or two others. The language of the constitution of Florida on this subject is as follows:

The Legislature at its first session after the ratification of this constitution shall by law provide for the registration by the clerks of the circuit court in each county of all the legally qualified voters in such county and for the returns of elections; and shall also provide that after the completion from time to time of such registration no person not duly registered according to law shall be allowed to vote.

This, it will be observed, is a provision clear and explicit. That of the Alabama constitution many lawyers of that State claim is open to two constructions. It has not yet received a judicial interpretation from the supreme court of the State.

First. The necessity of registration at all is left in the discretion of the Legislature. Not so in Florida. If the constitution *per se* makes registration a qualification of voting, I am at a loss to see why it should vest such a discretion as it has in the Legislature over

the main question. Suppose the Legislature should not recognize a necessity for a registration of electors, how far would the constitution operate then in the direction claimed by the contestee and his counsel? It seems to me that the reasonable construction is that the General Assembly is authorized to enact a registry law and provide in that law that no person shall vote at any election unless he shall have registered as required by law; and when such law so provides, and not otherwise, registration becomes an absolute condition of the right to vote. The present registry law of Alabama does not contain any such condition.

Indeed, sir, it is hardly entitled to be called a registry law. It is crude and imperfect and its execution has been of the same character. Registration made in 1875, under that law, is a complete registration to-day. Registration in one Congressional district or in one town or precinct is registration, under that law, in any other within the State. And when you go to-day to pick up the registrations down there where it is provided each county judge shall have a book containing a list of the registered voters, you find it existing in mere fragments.

Judge after judge, constituted by law the custodian thereof, swears he does not know where his book of registry is. Another judge swears he has a few scraps of paper, that they call a registration list, in his office. So it goes. The law has never been executed as it is. And the law never required any man to register in order to have a right to vote. The law provides any man going to the polls who is not registered shall have the privilege of going to a registrar, appointed on the morning of election, and may register. And that is a compliance with the law.

Well, my friend Mr. Wheeler comes here and he tells us that he has found a column of voters away up into the thousands that voted for Lowe and were not registered, and therefore, if we are going to put back the 500 and odd voters rejected on account of the numerals, he will take out on the other hand those who were not registered, and still remain in his office as member of this body. Well, it is an ingenious process. I do not know whether the gentleman originated it or some attorney for him; or whether he has consulted the board that issued the yellow circular. I cannot tell, but it is the most ingenious thing that ever was done. Still it has no bottom, or strength, or merit in it from beginning to end. There is not a fact connected with it that is true; not one. And when you tell me that you have looked over these registered lists, imperfect as they are, and that you find a large number of those voters were not registered, and yet that they voted for Lowe, I state this in reply: first, you have no proof that they ever voted for Lowe any more than for yourself. And second, you have no proof but what they were registered. In order to test it we took the pains the other day to run over a few of your lists of names, and we found that where you alleged names were not on the registry list which were on the poll list we found a whole lot of names, which I have here on this paper. We found all these names, gleaming right over your track, on the very registration list where you claimed they were not and did not exist. Here is a long list of them which I have rolled up here—a roll as long as the moral law; it contains five hundred names and more.

Again, I call your attention to the certificate of Judge Richardson, a probate judge in this district. Under the law he was the custodian of this registration list. Let us see what he says:

I further certify that registration book No. 1 of said precinct has been lost or mislaid; that diligent search has been made for it, and that it cannot be found.

And yet right out of that very book that is lost, gone where the woodbine twineth, [laughter,] the gentleman certifies to 275 names as not having been registered. That is part of the method, you know.

Mr. WHEELER. He puts in the original registration list in place of the registration book.

Mr. HAZELTON. Oh, yes; after the registration list is lost he puts that in instead of the other.

Mr. WHEELER. The original registration list is one thing; the registration book is another thing.

Mr. HAZELTON. He swears it was lost. Another man swears somewhere that he has a few slips and scraps of paper in a pigeon-hole, and he calls that a registration list. But under your law no man is required to register.

Another thing: suppose there was not one of this whole list of voters registered. They were never challenged at the polls for non-registration, and you know that every vote was received and put into the ballot-box, received from the sovereign voter, and not one of the whole number was challenged on account of not being registered. Now, if there is any principle of law in the world that is settled it is that where a man otherwise qualified to vote is not challenged for non-registration and the registration law contains no condition that he must be registered in order to vote, his vote shall be received and counted and certified. Tell me if that is not the law everywhere?

Mr. WHEELER. No, sir; it is not the law in Alabama.

Mr. HAZELTON. It is not the law in Alabama, you say. It is the law wherever man is civilized or understands the law. [Laughter.] It is the law in my State, and I believe it is the law in Alabama.

Mr. WHEELER. Your supreme court in Wisconsin says that a vote like the "Lowe" vote is not a legal vote.

Mr. HAZELTON. Furthermore, just see how—

Mr. WHEELER. And your committee in the Bisbee case said that such a vote as this was illegal; that a man who was not registered had no qualification as a voter, and on Thursday you put a man out on just such a decision.

Mr. HAZELTON. That is all right; you have said what you wanted. [Laughter.] Again, let us examine this little registration business once more.

Mr. HOOKER. Does the gentleman say that where a registration law prevails a man has a right to vote if he is not registered?

Mr. HAZELTON. The law is this: if a man is qualified in every other way, and the inspectors of election receive his ballot unchallenged on the ground of non-registration, and the law fails to make registration an absolute prerequisite to the right to vote, his vote must go in, and neither you nor anybody else can stop it.

Mr. WHEELER. And let me say—

Mr. HAZELTON. That is to say, conceding that you have a registration law in Alabama, which I do not concede at all.

Mr. HOOKER. Everywhere where the registration law prevails it is the duty of the inspector of election to look at the list, and if the name of the person applying to vote is not there he cannot vote. My own vote has been refused for that reason.

Mr. DAVIDSON. Apply the rule in this case that you did in the Florida case.

Mr. WHEELER. Let me say—

Mr. HAZELTON. Only two or three at a time. [Laughter.] This registration law provided that the inspectors of election should have at every poll in the district, at every precinct, a man with registration certificates; and whenever a voter was not registered he could apply to that man and be registered right there and vote. Now, are we to presume in the face and eyes of evidence, which says to us that their registration books were scattered to the four winds of heaven, with only a few scraps of paper in pigeon-holes, that this man did not sit at that poll under the law and qualify these voters by giving them certificates? There is not a particle of proof in the case to show that such was not the case at every poll.

Mr. WHEELER. Allow me to say one thing: the law provides that that registration list of men who register on the day of election shall be sealed up with the returns and sent to the probate judge; and the probate judge cannot get the returns without getting that list. That list is evidence to show the registration on that day, and such lists were sent in from twenty-six districts.

Mr. HAZELTON, (to Mr. Wheeler.) You certainly now cannot complain that I do not allow you your time.

Mr. WHEELER. I do not.

Mr. HOOKER. And does not the gentleman know that in the Florida case you threw out votes for that reason?

Mr. HAZELTON. Yes; and the constitution of Florida provides that there shall be a registration and that the voter must be registered in order to vote.

Mr. DAVIDSON. And so it is provided in Alabama.

Mr. HAZELTON. Which I deny.

Mr. HOOKER. You construe the law to suit you in each case.

Mr. HAZELTON. Yes; and I am regarded as a fair lawyer, and I do not construe the law except in the right way. [Laughter.]

Now look at this. Here is the form of oath required to be taken in such a case:

STATE OF ALABAMA, ——— County:

I, ———, do solemnly swear (or affirm, as the case may be) that I have known (here insert the name of the person offering to vote) for the last twelve months preceding this election, and that he has been a resident of this State for said time, three months in this county, and that he has actually resided in this precinct (or ward) for the last thirty days, and I believe he is twenty-one years of age or upward, and that he has not voted before on this day, at any general or special election. So help me God.

And just above that I find the form of oath which the voter is required to take:

STATE OF ALABAMA, ——— County:

I, ———, do solemnly swear (or affirm) that I am a duly qualified elector under the Constitution and laws of the United States, and the constitution and laws of the State of Alabama, and that I have resided in the State of Alabama one year next preceding this election, three months in this county, and have actually resided thirty days in this precinct or ward (as the case may be) next preceding this day, and that I am twenty-one years of age, or upward, and that I have not voted before on this day at any general or special election, at the place of voting, and that I have not been convicted of treason, embezzlement of public funds, malfeasance in office, or of any crime punishable by law with imprisonment in the penitentiary, larceny, or bribery. So help me God.

And then the law of Alabama provides:

And upon such oath being duly taken and subscribed, the ballot of the person offering to vote must be received and deposited, as other ballots of qualified electors.

And this law is no part of the registry law, and confers this right outside of it.

Mr. WHEELER. Suppose he should be an illegal voter?

Mr. HAZELTON. I do not care what he is. He can swear in his vote under that law, and if he swears falsely then the law says he shall go before the next grand jury sitting in that county and be tried. But when he comes to the polls and makes that oath, under the privilege and right which the sovereignty of Alabama gives him, she has no right nor has any one to intervene or interpose between the right she has given him and his right to vote.

Mr. WHEELER. Suppose he was not a legal voter?

Mr. HAZELTON. But I do not want any supposing. I am talking business. [Laughter.] I say there is no man in Alabama, registered or unregistered under your law, who applies under this great privilege which your State has given him and complies with that form, who can be deprived of his vote by any person there.

Mr. WHEELER. Let me ask you this one question: suppose that a Republican should prove that the man who voted was an illegal voter?

Mr. HAZELTON. I cannot stop to answer all your suppositions. I cannot take up my time in that way. I have told you three or four times that if the man voted illegally he must take his chances before the grand jury; but the result of the election cannot wait for the grand jury.

I can go to the evidence and find you instance after instance in which affidavits were made by Democratic inspectors of election showing that they were enjoying this great privilege which the State of Alabama had given them. My friend from Texas [Mr. MILLS] states that these affidavits were not certified. Sir, every one of them was certified but one; and in regard to that one our committee obtained an amended certificate from the very party who was competent to make it. And that amended certificate came to our committee, covering all these cases. It is referred to in Mr. RANNEY's views, and the contestant and his attorney and every man connected with this case knew that that question was foreclosed when that additional certificate came into the committee-room.

Mr. WHEELER. The clerk of the committee told him that there had been no such certificate there.

Mr. HAZELTON. Yes, there is.

Mr. WHEELER. I have inquired for it.

Mr. HAZELTON. Your attorneys understood it was there. I have it here myself.

Mr. WHEELER. I wish you would read it.

Mr. HAZELTON. There was a certificate on every one of the depositions but one, and as you made such a fuss about it we sent down there to the officer and got a certificate which covered that very deposition. It was sworn to there, and it comes back here, and not only covers that one deposition but every other deposition in the case, and ends the question.

Mr. WHEELER. I ask to have it read. The clerk of the committee said there was nothing of the sort here.

Mr. HAZELTON. It is here for everybody to see.

Mr. WHEELER. I would like to have it read, because I say the clerk says it never was there.

Mr. HAZELTON. Here it is; it covers every case:

Personally appeared before me, A. W. McCullough, a United States commissioner of said court, Robert W. Figg, who being duly sworn, deposes and says, that the certificate signed by him and printed at page 1263 of the record in the case of William M. Lowe vs. Joseph Wheeler, was duly made by him and was attached to and relates to all of the depositions taken before him as a notary public in said cause—

Here, Mr. Reporter, take this and print the whole of it. [Laughter.]

The certificate is as follows:

Circuit court of the United States for the northern district of Alabama.

STATE OF ALABAMA, Madison County:

Personally appeared before me, A. W. McCullough, a United States commissioner of said court, Robert W. Figg, who being duly sworn, deposes and says, that the certificate signed by him, and printed at page 1263 of the record in the case of William M. Lowe vs. Joseph Wheeler, was duly made by him and was attached to and relates to all of the depositions taken before him as a notary public in said cause, to wit, the depositions of Thomas W. White, record, page 37; William L. Goodwin, record, page 42; Nicholas Davis, record, page 47; Joseph H. Sloss, record, page 55; James A. Pickard, record, page 116; Robert Brandon, record, page 128; Thomas B. Hopkins, record, page 129; Lockhart Bibb, record, page 137; George W. Maples, record, page 140; William L. Christian, record, page 143; Robert J. Wright, record, page 147; Edward C. Lamb, record, page 149; William W. Hayden, record, page 151; Nathan Whittaker, record, page 153; Richard H. Lowe, record, page 156; John Hertzler, record, page 173; Lowe Davis, record, page 190; George Ragland, record, page 197; James Jones, record, page 200; John Kibble, record, page 202; Alex. Jamar, record, page 203; Pope McDaniel, record, page 206; William Wallace, record, page 215; Wade Blankenship, record, page 231; John Wesley, record, page 243; John H. ROBT. W. FIGG

Subscribed and sworn to before me this 24th day of March, 1882.

A. W. McCULLOUGH,
U. S. Commissioner.

Mr. WHEELER. That is the first time our side ever heard of that. Mr. HAZELTON. Did you ever hear of the charge of forgery in the minority report of this case? You will find there in the back end thereof, covered up in a mysterious manner, the statement that certain things were forged by my friend or his attorneys in this case.

Mr. WHEELER. Do you say I forged anything?

Mr. HAZELTON. I protest against these constant interruptions.

Mr. WHEELER. You say I forged.

Mr. HAZELTON. I have not yet made such a charge. I refer to the charge or insinuation in the minority report against Mr. Lowe, the contestant, or his attorneys.

You will find in the last page but one of the views of the minority the statement to which I refer. It is as follows:

It is also claimed by Mr. Lowe that Flint precinct was not counted in the returns of Morgan County, and that this precinct gave him 17 majority, but the proof regarding this matter is contradictory, and is tainted by a forgery, which the affidavit of the probate judge shows was indorsed upon it after it went in the hands of Mr. Lowe or his attorneys.

So far as reaching the meaning indicated, it is an absolute fabrication. What is this "taint" of forgery? In making up the official vote of Morgan County the proper officer had omitted to include by mistake, evidently, in his certificate the result of the vote at Flint box precinct, and this fact of omission was afterward noted on the outside of the certificate by the following memorandum: "Flint box not given; Lowe, 76; Wheeler, 59;" and was no doubt so noted by the returning officer or his clerk. In the light of the facts such an insinuation is an impeachment of the men who make it, and not of Lowe and his attorneys.

But, sir, if this be forgery; if such a circumstance constitutes forgery; how shall Wheeler escape the responsibility of such an imputation of crime—what shall he say to the facts which confront him upon the record of this case? Here they are:

HUNTSVILLE, ALABAMA, March 24, 1881.

DEAR SIR: I have just been informed that after the depositions for contestant were taken before you, that General Wheeler appeared before you and caused objections to be interpolated into the record. I desire respectfully to protest against this action as illegal. After the depositions were signed he had no right to make any changes in the record kept by you, nor to interpolate objections not made by him in writing while the evidence was taking. I beg that you will furnish me with a literal copy of the changes in the record so made by contestee, or by his direction, together with the date of such changes, and whether the same were made in the daytime or at night, and who, if any one, was present representing the contestant or claiming to represent him.

Yours, respectfully,

DAVID D. SHELBY,

Attorney for William M. Lowe.

Mr. ALEX. J. BENTLEY, N. P., Meridianville, Alabama.

The following, to wit, "And because no notice of any kind whatever has been served on contestee in any way whatever that said witness would be examined," was put on said deposition after it was signed, without my knowledge or consent.

A. J. BENTLEY, Commissioner.

And further than this:

The following letter, written by Mr. Bentley, the commissioner, to one of contestant's attorneys, shows clearly and distinctly what General Wheeler did at Meridianville. Here is Mr. Bentley's letter:

MARCH 10, 1882.

DEAR SIR: Yours of the 9th received. In reference to that part of the objections to the deposition of Dennis Donaldson, which is in these words, "And because no notice of any kind whatever has been served on contestee in any way whatever that said witness would be examined," I have this reply to make:

First. My recollection is that said words are in the handwriting of General Wheeler, the contestee.

Second. This entry was made some time between nine and eleven o'clock on the night we finished taking depositions at Meridianville for contestant.

Third. My best recollection is that no such objection to the taking of Dennis Donaldson's deposition was made at the time of the taking of said deposition.

Yours, &c.,

A. J. BENTLEY, Commissioner.

DAVID D. SHELBY, Attorney for Wm. M. Lowe.

Now, Mr. Speaker, this insinuation against the integrity of Mr. Lowe and his attorneys found its way into the minority report, as I believe, not from the facts in this case, not from the judgment or convictions of the distinguished men who made and submitted the report to this House, but in deference to the policy of a party caucus of the minority of this House, that had resolved to override the sovereignty of a majority of the American Congress in the execution of an unlimited power of the Constitution, the absolute right and power of this House to judge of the elections, returns, and qualifications of its own members, upon the mere pretense of forgery or fraud which was to appear upon the face of all minority reports in the election cases of this House involving the unseating of members on the other side of this Chamber, and furnish thereby an excuse for delay in the public business by filibustering as has confronted us for days in the South Carolina case of Mackey against Dibble.

I insist therefore that this imputation against Lowe and his attorneys is baseless upon the facts, and was made at the dictation of a party caucus and for party purposes.

Mr. WHEELER. There is the evidence; will you read it?

Mr. HAZELTON. No, sir; I am acquainted with it now.

Mr. Speaker, I have said this much upon the merits and the law of this case. I believe that the House will sustain me in the views which I have presented and the conclusion which I have reached, that Mr. Lowe is justly entitled to the seat now held by the contestee, Mr. Wheeler.

But, sir, I must not forget to state that this case has a higher importance and a broader significance than the mere controversy between two individuals, however distinguished, over the right to a seat in the American Congress. It is a truthful informer of the ways and means by which the Bourbons of the State of Alabama have betrayed the rights of its citizens and robbed the ballot-box of its purity and its sovereignty; far broader than this, it illustrates the "deep damnation" of that elective system conceived and maintained by the same power throughout the South whereby election precincts have been made the dens of political gamblers, and elections, State and national, among the most sacred of all our free institutions, have been for years a mockery and a crime.

It illustrates how the walls of the solid South have been built, how law has been defied, how the rights of the citizen have been trampled down, how the fountains and sources of political power have been poisoned in State after State of the South, in order to maintain and perpetuate against the honest will of the people a party of usurpation and wrong. It raises the highest question known to American politics. It appeals to the highest order of American patriotism.

The nation must die unless the ballot-box be redeemed from fraud and corruption. An honest ballot is the nation's life and the nation's salvation. The Bourbon of the South has betrayed its best interests in every direction. It is left for the Republican party to maintain and redeem the guarantees of the Constitution to the freemen of the nation.

Grattan once said on the floor of the Irish Parliament:

I will never be contented so long as an Irishman shall wear the link of a British chain clanking to his limbs; he may be poor, but he shall not be in irons.

In the same lofty spirit the Republican party, whose history is composed of the grandest and best triumphs of liberty and humanity, will never be contented until the ballot-boxes of this Union shall assert the free will of a free people; a people whose mission and destiny is the grandest on earth. [Great applause.]

The Customs-Collection Laws.

SPEECH

OF

HON. OLIVER L. SPAULDING,

OF MICHIGAN,

IN THE HOUSE OF REPRESENTATIVES,

Friday, July 7, 1882,

On the bill (H. R. No. 6682) to fix the salary of the collector of customs of the district of Chicago.

Mr. SPAULDING said:

Mr. SPEAKER: The bill to establish a fixed salary for the collector of customs at Chicago, in lieu of payment by fees and commissions, is a step in the right direction. It stops, however, short of the demands of the service. It should go further, and fix the salaries of all collectors of customs and abolish the fee bill.

And the several bills pending for creating new collection districts should, in my opinion, give way to general legislation having regard to our entire territory, abolishing useless districts, and creating new ones only when demanded by general and not by mere local interests.

Congress having taken action looking to a revision of the tariff, it is an appropriate time to consider the methods of its collection.

The laws relating to the collection of customs, the establishment

of collection districts, and the rates of duty on imported merchandise are embraced in statutory enactments from the first to the present Congress. They are, as a whole, antiquated, contradictory, complex, and obstructive; an exhibition of legislative patch-work, curious to look at, but embarrassing to handle. The revision of 1874 sought to reduce them to a systematic order of arrangement, but made no change in substance and took no steps toward modernizing a system based on the business ways and ideas of the early days of the Government. Changed conditions and the wants of modern commerce call for a radical change of system and laws. The demand so far has been met grudgingly and with temporary expedients.

A law of 1793 found in sections 4349 to 4351 of the Revised Statutes, having regard among other things to the then existing excise laws, requires entry and clearance of vessels engaged in a certain coasting trade and the collection of fees therefor. The reason for the law has ceased.

Steamers have taken the place of sailing vessels, and the demands of rapid transit and carriage of domestic merchandise on certain coastwise lines forbid the useless formality of entry and clearance, but the law is kept in sufficient life to compel the payment of the fees for services the Government does not render.

Section 3086 provides that all merchandise seized for violation of the customs laws shall be placed in the custody of the collector or other principal officer of the customs of the district in which the seizure is made. Under our present laws dutiable goods find their way into the interior outside any collection district and if there seized the law designates no officer as the legal custodian.

The act of March 2, 1831, authorizes a certain procedure in regard to entry and transportation of imported merchandise to ports on the Mississippi River. Our present warehousing laws prescribe another system of transportation, yet the old law, obsolete for twenty-five years, has been carried into the revision.

Section 2643 permits the purchase of stationery by the collector, while section 2646, just following, directs it shall be furnished by the Secretary of the Treasury.

The law requires the importer to produce a consular invoice at the time of making entry of imported merchandise, but he is permitted to make entry on a *pro forma* invoice, giving a bond to produce the consular invoice. If entry on consular invoice is increased 10 per cent. on appraisement a penal duty of 20 per cent. attaches, but an increase on entry on *pro forma* invoice involves no penalty.

A premium is thus offered to violate the law and withhold the consular invoice till after the liquidation of the entry.

These inconsistencies and incongruities in the law are not exceptional, but are cited to show the need of a thorough and intelligent revision.

Steamships and railroads have changed the course of commerce, and our foreign trade is centered at a few leading ports.

Foreign goods are no longer brought by sailing craft to numerous small ports, there to pay duty and be distributed by slow carriage to the fringe of population along the sea-coast. Often as soon as landed they are carried by rail hundreds of miles inland to pay duty at the place of destination instead of the first port of arrival in the United States as contemplated when our customs laws were framed and our collection districts marked out. Reference to our statutes shows that districts were formed with regard only to commerce by water. The statutory phrase of their formation is "to comprise the waters and shores," &c. Nowhere is the interior recognized, and no provision is made for districts to be reached only by rail. The demands of a new trade have called for ports of delivery, which ought to be ports of entry outside and beyond the limits of any present district.

On the other hand, considerable ports of fifty years ago have been forgotten by the foreign trade, and left high and dry out of sight of the present channels of commerce. Occasionally a sailing-vessel creeps lazily into the waters of one of these old-time ports, but brings no dutiable goods. The duties of the customs officers are confined to the enrollment and license of coasting vessels, the collection of hospital dues and fees, which ought to be abolished, and the prevention of smuggling. And for this service they have all the machinery of a district, so long unused as to be rusty and out of gear, and of the workings of which they are ignorant. Such districts should be dismantled and a reorganization had in the interest of economy and efficiency.

In every district there must be a collector, with certain deputies and inspectors. Each collector, though doing little business, is required to render accounts and reports in the same manner as if a large business were done; and these must be examined and audited by the proper officers of the Treasury. If these districts were merged in the more important ones, the vessel business could be as well done and the revenue as well guarded by a single deputy at each port as by the present corps of officials, while the number of accounts coming to the accounting officers of the Treasury would be reduced. Not only should consolidation be had in such cases but the entire country inland should be mapped into new districts or annexed to the old.

En route to their place of appraisal immediate-transportation goods are without the bounds of any district and beyond the jurisdiction of any collector, though the law presumes such jurisdiction and requires it in case of seizure. For example, Indianapolis, Atlanta, and Denver by recent laws are ports of delivery; yet neither is

within a customs district. Each surveyor has jurisdiction at his port, but none outside by the letter of the law. He would have as little authority over dutiable goods in the territory intervening between his port and the limits of the next district as would the collector of that district. And a case has just arisen involving the importers of Saint Louis in needless expense because the surveyor of that port has no jurisdiction of East Saint Louis.

The district of New Orleans is constituted as follows: "To comprise the waters and shores of the State of Louisiana east of and including the northern portion of the Atchafalaya River down to a point due west from the northern boundary of the town of Plaquemine, in the parish of Iberville and east of the Bayou La Fourche and all the waters and shores of the Mississippi River, and of the rivers which empty into it or any of its branches, except the waters and shores within the State of Mississippi, and except the west bank of the Mississippi River, between the towns of Plaquemine in the parish of Iberville and Donaldsonville, in the parish of Ascension, in which New Orleans shall be the port of entry, and the ports of delivery shall be as follows: Bayou Saint John; Pontchartrain, on Lake Pontchartrain; Pittsburgh, in Pennsylvania; Wheeling, in West Virginia; Cincinnati, in Ohio; Louisville, in Kentucky; Saint Louis, in Missouri; Nashville, in Tennessee; Memphis, in Tennessee; Evansville, in Indiana; Burlington, in Iowa; Galena, in Illinois; Alton, in Illinois; Quincy, in Illinois; Lakeport, to include the terminus of the new canal; Madison, in Indiana; Paducah, in Kentucky; Jeffersonville, in Indiana; Cairo, in Illinois; Keokuk, in Iowa; Dubuque, in Iowa; Parkersburg, in West Virginia; Leavenworth, in Kansas; Omaha, in Nebraska; Kansas City, in Missouri; Saint Joseph, in Missouri; Shreveport; La Crosse, in Wisconsin."

The law-book makes New Orleans the port of entry for this vast district. The laws of trade deny it. The sensible thing to do is to change the statute and conform it to the fact of our railroad system and the course of inland transportation. Changed conditions demand new legislation, and we cannot afford to cling to old methods simply because they were good enough once. The more important of these ports of delivery should become ports of entry by law as

they now are in fact, and all should be brought within proper and convenient districts. It would involve no additional expense. The number of officers and the machinery would remain unchanged, but the entire country would be embraced within some district and within the jurisdiction of the chief customs officer, who would be known as collector instead of surveyor.

As the district is now constituted no officer other than the collector at New Orleans is entitled to the custody of goods seized outside these several ports of delivery, and even his jurisdiction is doubted beyond "the waters and shores" of the Mississippi River and its tributaries.

The immediate transportation business, coming both from the Atlantic and the Pacific, is immense, and this question of jurisdiction should be settled by appropriate legislation in view of probable litigation and loss to the revenue.

New districts are erected by nearly every Congress. It is a local and fragmentary kind of legislation that should give way to a general law covering the entire subject and embracing the whole country.

Special legislation is not likely to be the best, and the case under consideration furnishes no exception. It is not hard to find proof of this in examples ready to hand. A district made only a few years ago has never collected a dollar of duties, and is not situated to invite smuggling. Last year but two foreign and ten coastwise vessels entered its waters, and but three foreign and eight coastwise cleared from its ports. The district was the result of a local, not a general, demand. It cost the Government \$2.18 to collect each dollar received, and the disparity between receipts and expenditures was largely because of the equipment of a district.

In the fiscal year ending June 30, 1881, twenty-two ports of entry collected no duties, and in thirty-two districts the collections from all sources did not equal the expenditures.

The following tables show the business transacted in each district for the time above named, and the expense of maintaining certain districts, with the estimated saving to be effected by the bill introduced by me early in the session for the consolidation of customs districts and the abolition of fees:

Statement showing business transacted in each of the several customs-collection districts for the fiscal year ended June 30, 1881.

quote the following, which I believe is indorsed by every officer of experience in the customs service:

These fees are made up of a great number of small and annoying exactions from importers and ship-owners, are difficult to collect, and involve a great and unprofitable amount of clerical work in keeping, stating, and auditing fee and emolument accounts. There is also an unavoidable uncertainty as to how much of the revenue from official fees is duly accounted for, how much is uncollected or intercepted by the way, and how many illegal and oppressive exactions are made by ignorant or unscrupulous officials.

All officers should be paid by fixed salary in no way dependent upon fees collected. This is now the case at seven leading ports—to which it is now proposed to add Chicago—but at the others collectors are paid by fees and commissions, with the addition in most cases of a small salary, the whole not to exceed a certain maximum sum, generally fixed at \$2,500 or \$3,000 per annum. They are allowed, in addition, compensation for storage, not to exceed \$2,000 per annum, where there are bonded warehouses. This allowance is based upon the theory that the collector is responsible for the custody of bonded goods, and that the money paid by proprietors of bonded warehouses to reimburse the Government is in the nature of storage. In such cases the Government pays the salary of the storekeeper and is reimbursed by the warehouse proprietor; but as the money is regarded as storage and is allowed to the collector, the intent of the warehouse laws, that the custody of bonded goods should be free of cost to the Government, is defeated to the extent of such allowance.

Under this system opportunity is given to obtain fraudulent allowance of storage by fictitious payments to employés of warehousemen improperly appointed as storekeepers, or to men of straw in order to establish a basis for a claim for storage.

The fee system is also objectionable because it furnishes an uncertain and sometimes an inadequate compensation to the officer, who is thus tempted to grant privileges to importers not only unknown but contrary to law, to bring business from other ports to his own. In a word, the system of compensation by fees, commissions, and other allowances is objectionable because—

First. It necessitates voluminous and complicated emolument accounts, the preparation and auditing of which involve much clerical labor.

Second. It furnishes an inducement for overcharges as to fees and fraud as to storage allowances.

Third. It is uncertain and irregular, affording in some cases excessive and in others insufficient compensation to collectors.

I have no doubt the abolition of the fee system for fixed salaries would be met by advantages fully compensating any loss to the revenue from this source. If, however, it is to be continued, the fee bill should be revised and the present loose and annoying methods of collection give way to collection by stamps. Our vessel interests justly complain of certain burdens incident to the custom-house. How far relief can be extended to vessels in foreign trade I shall not now discuss. But vessels trading on our inland waters are burdened with taxes for which there is no excuse. The law, which I have before cited, requires all vessels trading between ports in different collection districts to report and clear at the custom-house and pay a prescribed fee.

The intent is to protect our revenue from frauds incident or possible to the foreign trade. The reason of the law ceases when applied to domestic trade in inland waters. Yet it is broad enough to burden this trade with a tax benefiting no one, and for which the Government renders no equivalent. It subserves no possible interest, public or private, that vessels trading only on Lake Michigan should be annoyed by this formality, and a business none too remunerative should be burdened by an inexcusable tax. A law only necessary in its application to vessels in the foreign trade should not rest on boats carrying strawberries and peaches from Western Michigan to Chicago, and its amendment as to domestic interior trade cannot come too soon.

Among our customs machinery is found a comparatively modern invention quite expensive and altogether useless. The inventor of the consular invoice and certificate acted upon a plausible theory not justified by its practical workings. The system is not simply a failure, it is costly and obstructive. These papers are made in triplicate and are intended to give the foreign market value of imported merchandise and other information to aid the appraising officers in fixing dutiable value.

As a matter of fact they do no such thing, and no appraiser accepts the invoice value as his appraisement without evidence that would be convincing without the invoice. Were he to do so it would be the old story of the blind leading the blind with the usual ending. In some instances the rush of business and hurry in shipping forbids inquiry as to the true value by the consular officer before certifying the invoices, but in more cases it is not improbable he accepts without inquiry the value given him by the owner. Instances can be cited where the same consul on the same day has certified the value of the same class of goods at quite different values. And it has come within my own knowledge as a customs officer that invoices, certified and sealed, have been given in blank to importers to fill up as they might require them.

It has resulted that consular agents have been appointed in interior towns who divide their fees with their principal, and whose efforts are greater to sell invoices for the statutory fee of \$2.50 and

Custom-house fees were established in 1799 upon the theory that the customs service should be self-sustaining. It was a bad theory and a failure in practice. The fee bill still exists, but no custom-house has paid its way in fees for years.

From a late report of an officer of the Treasury Department I

notarial fees added than to get accurate information for the Government.

The customs service would be better off without these officers, and importers ought to be relieved of the delay and tax incident to the invoice. Consuls should be stationed at all foreign ports reached by our shipping, or where required by the State Department, but the Treasury Department can afford that interior consulates, commercial and consular agencies, and consular certificates disappear together. And with these should go custom-house oaths. They afford no protection to the revenue not obtainable without imposing upon the importer the hardship of personal attendance at the custom-house.

A simple declaration of the importer, attested by a notary and made by law of the binding force of an oath, is recommended as safe for the Government and a relief to the importer.

Our customs laws are the gradual growth of years and the work of all political parties. Experience has condemned some; others have outlived their day. Their revision is not a matter of politics, but of business. I have suggested some needed changes; many others will occur when the work is undertaken.

Internal-Revenue Taxation.

SPEECH

OF

HON. ANDREW G. CURTIN,

OF PENNSYLVANIA,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, June 27, 1882.

The House having under consideration the bill (H. R. No. 5538) to reduce internal-revenue taxation—

Mr. CURTIN said:

Mr. SPEAKER: If this Congress at its assemblage had approached an empty Treasury I cannot but feel that its action might have met with the much more hearty approbation of the people who sent us here. We would have been compelled to legislate in the direction of economy, and would have endeavored to originate measures by which the Treasury would have been supplied so as to maintain the national faith and pay the necessary expenses of the Government. It would, no doubt, have been the general sentiment as well as the disposition of the members of the House to have so legislated in the interest of economy as to reduce the expenses of the Government; and, really, it seems to me that it would be better for the country and its future, and more creditable in the legislative action of Congress, for us to endeavor, as far as possible, to retrench and lighten the burdens now resting upon a tax-paying people.

We have legislated lavishly from a full Treasury. We have provided for the erection of court-houses and custom-houses and post-offices where such conveniences may have been needed, but I fear they were in many instances passed by combinations in this House, where there was no actual necessity for them. We have been liberal, and it might not be unjust to say lavish in appropriations for the improvement of river navigation to facilitate internal commerce and the improvement of harbors for the better accommodation of our foreign commerce. We were invited to a full Treasury when we came here, and we seem by our actions to have accepted the invitation.

WHAT RELIEF IS OFFERED TO INDUSTRY?

When the session commenced it was expected by the people that a large reduction would be made to relieve the people from the burdens of internal taxation, and thus afford a measure of relief to the productive interests and industries of the country. In the bill presented to the House from the Committee on Ways and Means I now ask what measure of relief is afforded to those who produce? I presume the bill under consideration is to pass as it comes from the committee under the inexorable will of the majority, trained, disciplined, and ready for action. It was certainly anticipated before the introduction of this bill, and it is even not unjust to say that it was promised that there would be actual relief to the industrial interests of the country and to the pursuits of productive labor.

The bill now about to become a law has offered a broad field for discussion in this House, and no doubt many of the speeches made were intended for home consumption, and will find their way into districts represented by gentlemen on this floor. The Democrats stoutly contend for large reductions, and many of them for the repeal of all the war taxes, the entire abrogation of the internal-revenue system and with it the four or five thousand public officers who find their means of support in the continuance of the system. The bill on passage does afford relief to the people in relieving them from the tax on matches that nobody seriously felt and which is scarcely appreciable, for, as was repeatedly stated on this floor, es-

pecially by the distinguished gentleman who stands at the head of the Ways and Means Committee, that relief was to be afforded to the producer, and as the tax on matches is the only relief which is offered by the bill, not much in that direction has been accomplished.

ARBITRARY AND OPPRESSIVE TAX LAWS.

Early in the session the gentleman from Missouri [Mr. HATCH] introduced a bill to relieve the onerous taxation from which the tobacco interests of his constituents suffered. He represented that the law as it then existed rested oppressively upon a large portion of his constituency, and his presentation was so clear and the justice of his demand so impressed the House that he came within seven votes of the two-thirds necessary to have the bill taken up out of order and passed; and yet of the number of amendments offered to this bill, directed to the relief of that interest by that gentleman and others, not one of them was accepted by the majority.

Gentlemen had changed their views and political considerations had affected their judgment and their conscience and the force of discipline made the majority solid in the House with very rare exceptions. I voted for every amendment offered to the bill to give relief from that oppressive tax and the manner of its collection, and I cannot but be of opinion that this bill when passed will afford no relief to that industry without that provision in it.

I will not pretend to offer to this House the various acts of Congress on the taxation of tobacco and its means of collection that have been reiterated over and over again and are well understood, but will confine myself to a presentation of the various laws and their oppressive features as briefly as possible.

The dealer in tobacco who is licensed pays an annual fee of \$25. The farmer who produces the tobacco can sell to him, but only by the bale or hogshead. There is a fictitious retail dealer in leaf tobacco, so called, but there is none in fact, and the proviso of the statute is a delusion, for the very conclusive reason that the law which pretends to license him to deal in leaf tobacco by retail fixes the tax and license he is required to pay so high that it is impossible for any one to follow the business. For example, he is required to pay a license of \$500, and for every dollar's worth of tobacco he deals in over \$1,000 he is required to pay fifty cents to the Government. Of course no one can afford to follow a business in which he is required to pay one-half of its proceeds as a tax, and it follows as a logical sequence that there are no retail dealers in leaf tobacco; and therefore no one of that class fixed by the law to whom the producer can sell in quantities less than a hogshead.

This must necessarily prove oppressive to small farmers who do not raise a hogshead of tobacco. There is a pretense in the bill now under consideration that the small producer may be relieved by a reduction of the license of the dealer in leaf tobacco to \$250, and requiring him to pay thirty cents on every dollar's worth of tobacco he sells over \$1,000; but this of course is quite as much a prohibition to retail dealers as the provision in the law it is intended to repeal, for no one can afford to pay a license of \$250 and then pay thirty cents on each dollar of the proceeds of his business for all he sells above \$1,000 worth. So in this respect the bill is simply a deception, unworthy of our Government, and was drawn in ignorance of the law or was designed for the continued oppression of that class of the people of the United States who are producers of tobacco in small quantities.

THE TAX-GATHERER AND THE TOBACCO TAX.

I notice that in June, 1880, Congress passed a law permitting parties who paid a license of \$5 to buy leaf tobacco by retail to the amount of 25,000 pounds per annum, and to such licensed dealers the farmer was allowed to sell his tobacco in any quantity provided he raised it on his farm or received it as rent from tenants, but even this trifling boon to the small farmers and producers is taken away by the bill under consideration.

Mr. Speaker, I will present a case which might readily occur, and it shall not be located in the South, where the production of tobacco is one of the great staple industries, nor will I draw this question geographically. I will suppose that a farmer in Lancaster County, Pennsylvania, where the tobacco crop this year is estimated at \$4,000,000, may choose to cultivate four acres of ground which he owns and where he lives. From one acre he may produce potatoes, from another turnips, from a third corn, and from the fourth tobacco. The sweat of his face falls upon all alike from the time he puts the seed in the ground until his crop is matured and mother earth renders back to him the reward of his labor. The crop raised by this man, except that upon one acre, is as free as the air he breathes.

Beneficent providence gives to all alike the earlier and the later rains, with the warmth necessary to give productive earth all the stimulants which will reward his labor. All the employments of nature, the appliances, care, attention, and work, come to all that he has placed in the earth in full confidence of return. The man is no doubt a good citizen—for the people of Lancaster County are generally law-abiding and industrious—and pays all his dues to the Government and honestly discharges all other personal and relative obligations. He takes the product of the three acres in corn and potatoes and turnips and sells them where he can get the best market, and applies the proceeds to the support of himself and his depend-

ants, but the product of the acre of tobacco he dare not sell except to the licensed agents of this Government.

The Federal power of this great people, having its seat in this capital, with all its appliances and appointments, watches that tobacco as it grows and unfolds its leaves and is prepared for the harvest in its maturity, and through its agencies, its collectors, its licensed dealers, its privileged class declares that as to that production he is not a free man, and that he shall sell and sell only where this central Government directs, and by and through the agents it has licensed. I can conceive of no reason why the iron hand of this Government should be laid upon that acre and its production while it does not rest upon the other three; nor why, according to our great living policy of right and equality he should not be at liberty to cultivate and sell the product of the soil where he pleases. And as our Government, which is an emanation from the people, should be parental, we disturb this harmony and that generous quality by an espionage searching as are the laws to which I have alluded, and the citizens who discharge the duties imposed by such laws become as distasteful and odious as was the tithe-gatherer in England, the gauger, excise man, and agent in Ireland, and the oppressive exactions made by the farmers of the revenue from the Christian people of the provinces of Europe dominated by the Turk.

IS VICE LEGALIZED IN PUBLIC REVENUE?

It is said that tobacco is a luxury. That is no reason for discrimination and for an unjust and odious tax. There are thousands of luxuries that are not taxed. The cereals and meat maintain life, and that is about all that is given to labor. Wealth can purchase luxuries, and most of the luxuries can only be enjoyed by the wealthy who can purchase them. There can certainly be no serious objection to the purchase or the use of the luxuries of life in addition to the necessities which sustain it, provided you do not interfere with the growth and progress of the country; and the man who raises his acre of tobacco and the man who toils from morning till evening has a right to solace himself at the close of the day with the use of tobacco as those who have means have the right to the enjoyment of the luxuries which they purchase where they please, produce at their pleasure, and buy and sell without the interposition by this Government of a middle-man, or being subjected to imposition of licensed agencies of the Government. Many productions of the earth may be considered luxuries quite as much if not more than tobacco, and all these remain without taxation or the intervention of the Government or its agencies.

Mr. COX, of New York. Perfumery.

Mr. CURTIN. Ah, yes; I believe the tax is taken off perfumery in this bill. I do not know whether the Committee on Ways and Means, that incubated so long before proposing this bill, composed of so many of the leading and experienced members of this body, would consider perfumery a luxury, and I would therefore leave that to the credit of the committee; but, sir, suppose tobacco should be considered a luxury and not a necessary of life, and for the present we will take whisky and malt beverages as luxuries. If their use is a vice and immoral and tending to corrupt and debase all who use them, is it any reason why this Government should relieve such immorality or cure such vices by the imposition of unjust and discriminating taxation, and thus raise money to defray the expenses of the Government and afford opportunities for lavish appropriations from a pléthoric Treasury, and fail to tax other vices quite as common and more injurious and demoralizing in their practices?

It is not in harmony with our history and traditions; it is not consistent with the principles of equality which underlie our structure of government; it is legislation for a class; it is affording special privileges; it is favoring monopoly; it is unjust, discriminating, and unequal in its operation, and it employs hordes of public officers who could be dispensed with if the tax on these articles were equal. It is a departure of the Government from its great fundamental principles. It is an abnegation of the great sentiment of equality which prevailed when our Government was formed, and enters into all its actions when it makes demands from the people for its support.

STUDIED OPPRESSION IN SECTIONAL LAWS.

Tobacco is a staple production in a large portion of this country; and I presented a case which might occur and no doubt does occur in Lancaster County so as to be north of the belt and so that it might be made clear to my friend the distinguished gentleman who so ably represents the Lancaster constituency. The law, so unjust, so discriminating and partial, has not been administered in Pennsylvania. The freemen of that State are not accustomed to such rigid exactions. Faithful to the Government, they desire above all blessings just laws equally administered, unmanacled freedom of person. The less they see of the tax-gatherer and agents of the Government the better; and if the many, the very many, painful instances of oppression and wrong practiced south of the belt in the collection of the tobacco tax should be transferred or attempted to be transferred to Pennsylvania, I would scarcely expect them to forget their natural rights, their training in life, their fidelity to the Government and obedience to its laws, to reason them into passive submission.

It would certainly be a painful experience to the freeman of my

State, and would cause him to be restive from the time he put the seed in the ground until it grew to maturity, and after all his toil to feel, as it unfolded and generous nature giving it her assistance, that it was constantly watched by officers of the Federal Government, and that he was restrained in the sale of the production of the soil; that Federal officials and agencies surrounded him; that the tax-gatherers were also after him; that he would be arrested for the sale of the smallest particle except in the direction that the Government indicated; and that he would be dragged from his home to the Federal courts, perhaps far distant, and visited with pains and penalties and the expenditure of money for the sale of the production of the soil which he was trained to believe was as free as the labor of his life.

Gentlemen from the South and West who represent constituencies largely interested and occupied in the production of this staple have offered to this House in the long discussion to which this bill has been subjected instances of wrong and oppression which it is not improper to denounce as cases of wrong and oppression, if not tyranny, from which they should be relieved. It may be that these taxes were necessary when the Government was in need and the Treasury empty. It is possible that the Government may have been wrong in the supposition that those who produce tobacco are alone to be watched, but there was no rational excuse, no apology bearing the semblance of justice that warranted the studied invention of most arbitrary and oppressive laws to punish or control the political action of a large element of Southern industry. I simply repeat the truth of history when I say that this wantonly oppressive law was conceived and long administered in the South mainly to coerce the political action of the helpless citizen, and it has left a record of vindictive oppression by corrupt or reckless partisan officers that is an ineffaceable reproach upon the boasted Republic of the world.

During the discussion on this floor the distinguished gentleman from New York [Mr. HEWITT] at every phase of that discussion asked that alcohol used in mechanical industries, in the arts, and in medicines should be relieved from the burden of taxation; and he brought to the advocacy of his amendments unanswerable arguments, but, like all the amendments for oppressed industries, they were rejected by the majority of this House. Can it be possible, Mr. Speaker, that this is one of the remnants of that terrible war through which we passed? Can there still linger with the majority of this House a disposition to punish and to inflict that punishment by the exercise of the power of taxation? If so, it is inconsistent with our recent history and not in harmony with the Government or institutions of the country. If it is not so, why is it that the majority of this House so stubbornly adheres to the unjust and oppressive legislation which we now attempt to repeal or modify?

THE SACRED OBLIGATION TO PAY PENSIONS.

As I understand it, the relief afforded to the people of the United States in the bill now about to pass is about \$17,000,000, and it is admitted that the surplus revenue for this year will be about \$135,000,000, or an average of \$11 unnecessarily wrung from each adult male citizen in the country, already heavily burdened by municipal, county, and State taxation. That is a small reduction. It is not the reduction that was anticipated or expected or demanded by the people. We stand still in the presence of a great danger to the future of this country. We excite a desire to take from the public Treasury. If we leave this vast amount of money unappropriated, appropriations are demanded. We have given liberally to all those who have made demands without inquiring too closely into their justice. We have given \$100,000,000 to pensions, but that, sir, could not be refused. The Forty-fifth Congress, by solemn enactment, acknowledged a debt due to the soldiers of the Republic and accompanied it with a promise to pay.

The amount has been ascertained this year, and this Congress did no more than to accept the obligation and redeem the promise made by the United States; and as the men to whom the promise was made are growing old and are most of them poor, and as the debt has been due a long time, it is our duty to pay it as promptly as possible and to give all the necessary appliances for the speedy settlement of their claims. It is too late to question the wisdom or the justice of that law. It is on our statute-books, the debt is acknowledged, and you might as well go before the American people and attempt to repeal the fourteenth and fifteenth amendments to the Constitution of the United States, which contain the lessons and logic of the war, or you might as well expect the passage of a bill to reduce the wages of the members of this House, either of which would be quite impossible.

RELIEVING CAPITAL, NOT INDUSTRY.

This bill reduces the income of the Government, as I have said, about \$17,000,000. True, the tax on matches is taken off, whatever it amounts to. The bill removes the tax on patent medicines, and I am not sure that in reaching for luxuries that injure and in taxing those which please the appetite the poor man might not, in many instances, be as well off if this tax were retained, for patent medicines as often injure as they give relief. The bill takes the tax off bank checks, banking capital, and bank deposits, perfumery, &c. I am not here to question the wisdom of this, nor am I here to complain of any relief that may be given to any of the interests or business

pursuits of the people of this country; but I do say, sir, as it is just and right to declare, that there is no substantial change or modification of existing laws in the bill now upon passage which offers any relief to the producers or to the labor of this country.

If we are to reduce the income of this Government so as to compel its economical administration, then we should make our relief fall upon all classes alike. There should be no partiality in our legislation; there should be no discrimination against the industries of any class of our people. We should, as far as possible, reduce the expenses of the Government, and take special care to reduce the revenues of the Government in such manner as to afford the greatest measure of relief to the one great fountain of our wealth, the industrial classes. Removing taxes on bank checks, bank deposits, perfumery, &c., does not relieve industry. It does afford needed relief to capital, for some of the war taxes on capital are needlessly oppressive now, but the supreme want of the country to-day is the utmost relief from taxation on the necessities of life, or the luxuries which have become necessities by habit, which enter into the daily consumption of our industries.

The whole wealth, the honor, the hope of the Republic are in the producing classes. They are the source of our prosperity in peace and our safety in war, and the first duty of the Government is to be generously just to our industries in the reduction of needless taxes.

OUR DANGEROUS CENTRALIZED WEALTH.

It must not be forgotten, Mr. Speaker, that the centralized wealth and the money power, the incorporated capital of the country, with vast special privileges, cannot be contemplated without grave apprehensions for the future. That powerful class and the immense interests they represent are ever heard on this floor, and it has required the most stubborn struggles between the law-makers of the people and the law-makers of privileged classes to gain any measure of justice for the Government. They are ever present in and about the departments of authority. They are felt in the executive, the judicial, and the legislative channels of power, while the industrial classes are unheard and unfelt save as brave men plead their cause in the face of aggressive, organized, and often vindictive combinations of almost boundless wealth.

Nor are these influences any more nearly equal in the choice of our rulers and law-makers. The first legislative office of the nation is rapidly becoming a position that only the successful capitalist can attain, and our popular elections have become to a great degree subject to the baleful control of capital, regardless of the merits of men or measures. The struggle for that absolute equality of legislation for all classes, rich and poor, great and small, that is demanded by the very genius of our Government has been going on actively during the last score of years, and the growing power of the profiting classes over the industrial classes is creating profound fretfulness, as is now visible in every section of the land. I am not here to reflect in the least degree the views of the agrarian.

The honest industry of the country rejects and abhors the destructive doctrines of the commune, but it does demand even-handed justice, absolute equality in the laws which impose the burdens of government; and the bill before the House is shamefully defective in its refusal of relief to the producing classes. It is a false pretense of lessening the exactions upon one industry; it will be accepted as another step in special legislation for the benefit of the privileged class that represents capital, and it must provoke deeper unrest and intensified opposition from the now severely suffering labor of the land. Look out over the nation and learn what the gradual growth and almost insensible acceptance of this policy of legislation has produced, and you will not be amazed to hear the murmurs of the people coming up from every center of industry. Never before in the more than hundred years of the Republic has wealth been so vastly centralized as it is now.

We can all remember when the millionaire was one of the rarest creations of our free institutions; now they are counted by scores in all our great financial circles, and private fortunes are counted not merely by millions but by tens and scores and even by hundreds of millions. This rapid and general centralization of wealth has not been created by productive industry. It is very largely the creation of reckless and unscrupulous cunning alike in business and politics; alike in demoralizing legitimate business and demoralizing public legislation to serve the ends of heartless speculation. The whole market values of the country are to-day at the mercy of centralized wealth; it can enlarge or reduce values at pleasure, and it does so by sudden convulsions in the channels of speculation as often as it can profit thereby. Let us not forget that here, as elsewhere, where wealth accumulates men decay, and the decay of industry must date the decline of all the power and grandeur of the Republic.

JUST LAWS FOR LABOR AND CAPITAL.

There must be just laws for labor and capital, and my earnest protest against this bill is founded on its failure to reduce the revenues enough and its almost utter failure to relieve industry with capital. And this disappointment is thrown upon our industrial people at a time when the harmony between labor and capital that is absolutely essential to the prosperity of both is sadly interrupted by strikes and estrangements in many sections of the land. Labor has

as a rule been obedient to law in its contest for increased compensation to meet the increased cost of living, and it respects and obeys the law because it looks for just laws affecting its interests. It demands no favoritism, no class legislation, no special privileges, but it wants the necessities of life first relieved of oppressive taxation, and luxuries afterward.

The legislation of this Government must be in the spirit of even-handed justice to all interests; labor demands nothing more; it will be content with nothing less; and we are offering it a stone by this bill when it asks us for bread. We should legislate for the unity of all interests, for all legitimate pursuits and interests are in harmony; and that is what this body has persistently refused to do by rejecting all amendments designed to afford relief to the most important but least favored industrial class. Not being a member of any committee charged with the preparation of business for the consideration of the House, I have waited for seven months the action of the Committee of Ways and Means with the expectation that a bill would be offered giving reasonable and just relief to all interests now oppressively taxed and that would largely reduce the surplus in the Treasury; but the measure now before us caused me no little surprise because of its failure to meet the most pressing necessities of the country.

I have been connected all my life with the industrial interests of the people of my State, and at times, in the discharge of official duties, have had somewhat to do with the promotion of the prosperity and happiness of our great producing population; and I must say that this measure will be justly and greatly disappointing to the intelligent people of all pursuits, and must disturb rather than tranquilize existing class disputes. Recognizing the few meritorious features of the bill, I see them unjustly overbalanced by errors of omission and commission, and, the measure as a whole being an unjust discrimination against the producing interests of the country, I must oppose its passage.

Rivers and Harbors—The Hennepin and Illinois and Michigan Canal.

SPEECH

OF

HON. WILLIAM CULLEN,
OF ILLINOIS.

IN THE HOUSE OF REPRESENTATIVES,

Friday, June 9, 1882,

On the bill (H. R. No. 6242) making appropriations for the construction, repair, and preservation of certain rivers and harbors, and for other purposes.

Mr. CULLEN said:

Mr. SPEAKER: The bill now under consideration is an important one, whether considered in the light of the amount of money which it appropriates or the commercial interests involved. It is no easy task to frame a river and harbor bill so as to give general satisfaction to all sections of the country, and it will not be assumed that this bill is perfect, however earnestly the committee may have labored to make it so. I agree with the gentleman from Michigan [Mr. HORT] that the basis of apportionment ought not to be to States on population or area, or on the amount of internal revenue collected therein, but on the rivers and harbors in proportion to the extent of water-ways and commerce.

But when a State is a large producer of internal revenue and at the same time has within its boundaries extensive rivers, or lake or sea-coast, the appropriations should not be less liberal than to States in which but little internal revenue is collected. In this view of the case I think the appropriation for continuing the improvement of the Illinois River should have been at least what it was in the last river and harbor bill, \$250,000, especially as the engineers report that \$380,000 could be profitably expended within the year in completing the work.

The appropriation for the Mississippi River is large, and at first blush seems to be out of proportion with other important improvements. The wording of the paragraph, also, would impress the common mind with the idea that in its adoption the Government would be committed to the "levee system" as much for the protection of property as for the improvement of the navigation. The provision that "no portion of this appropriation shall be expended to repair or build levees for the sole and exclusive purpose of reclaiming lands or preventing injury to lands by overflows" is, to say the least, significant. Under this clause, if any other purpose could be assigned, whether to improve the navigation or otherwise, the whole amount of this appropriation not specifically assigned could be applied to the building of levees without an infraction of the law. But it is proposed to strike out the words "sole and exclusive," which if done will remove a grave objection to the present form of the bill.

I am not opposed to the construction of levees where they constitute the best form of improving navigation. If found necessary for that purpose and at the same time incidentally protect property I shall be glad. I shall not argue for or against the constitutionality of building levees for the sole purpose of protecting property, a doctrine held by gentlemen on this floor and elaborated in their printed speeches, believing that it does not come within the scope of this bill, the object of the bill being to promote the interests of commerce and not to protect against overflows.

The Mississippi is a great river, a great "artery of commerce," and I am therefore in favor of its improvement by liberal appropriations. I am in favor also of improving the principal tributaries of the Father of Waters—the Ohio, Missouri, Illinois, and other streams. Not only this but when two great rivers can be united by a short and comparatively inexpensive cut from one to the other, so as to save hundreds of miles of transportation, I am in favor of that. Of this character is the proposed Illinois and Mississippi, commonly known as the Hennepin Canal. Here, by a short cut of sixty-five miles across a level country, five hundred miles are saved in shipping the produce of the Northwest to the Eastern sea-board.

Objection is made to this improvement because it is a proposed canal. It is said the day of canals is past, that they have been superseded by railroads. I grant that the day for constructing canals of great length and small capacity is past. But when necessary to connect two great systems of water communication by a short link, the canal is as much a necessity as any other part, and sometimes indispensable. Thus the navigation above and below the Des Moines Rapids are connected by a canal, and canals are being constructed around the Muscle Shoals, on the Tennessee River, some thirty miles in length; around the Cascades of the Columbia; connecting the Fox and Wisconsin Rivers, and elsewhere. These are canals. They are not long, but they cost a great deal of money.

Now, on what principle does the construction of a canal around a water-fall to connect two lines or systems of navigation differ from cutting through a narrow tongue of land to accomplish the same result? In both cases the purpose is to overcome or avoid obstructions, and the plan to be pursued is a question of method and expediency. If the improvement be in the interest of commerce, and of sufficient magnitude to justify the expense, there is no more objection from a legal or constitutional stand-point to one plan than the other.

The Committee on Railways and Canals have reported favorably on this measure, but the views of the minority of that committee, as found in report No. 1000, part 2, signed by the able gentleman from Ohio [Mr. TOWNSEND] and the equally able gentleman from New York, [Mr. DWIGHT], for both of whom I have great respect, antagonize vigorously the construction of the Hennepin Canal, and assign many reasons for their opposition thereto. I propose to examine this report briefly, not desiring to extend my remarks on this branch of the subject. The gentlemen composing this minority are honorable men, true to their convictions, but I am persuaded they have been imposed upon by certain gentlemen representing certain manufacturing interests at Sterling and Rock Falls, Illinois, and have indorsed statements so extravagant that they will not bear the light of close investigation.

This minority report sets forth about nine objections to the construction of this canal by the General Government, the first of which is a constitutional one, set forth with the utmost gravity. It says:

In the first place the minority doubt the constitutional right of the General Government to enter a State in constructing any projected improvement lying wholly within the limits of a State, and calculated to benefit few people outside of the State.

The last clause is merely the expression of an opinion, and can have no bearing on the powers of the Government. The bill now under consideration appropriates \$300,000 for the construction of dams and the condemnation of land in Minnesota, covering an area larger than the State of Massachusetts, according to the statement of the gentleman from Minnesota, [Mr. WASHBURN], creating what is known as the "reservoir system," for the purpose of supplying water to aid navigation on the Upper Mississippi River at low stages.

This bill, with this provision, has the support of the gentlemen who signed this minority report, one of them [Mr. TOWNSEND] being a member of the Committee on Commerce, which committee reported this bill. Now, if the General Government can assume jurisdiction over this vast area within a State, and condemn private property without an infraction of the Constitution, why can it not condemn, if necessary, a strip of land three hundred feet wide and one hundred miles long in the State of Illinois for a public improvement more intimately connected with the great water-ways and in the direct line of commerce of the Northwest? But if there ever was any doubt as to the constitutional right of the General Government in the premises I assume that it has been settled by the State of Illinois in the passage by its General Assembly of a joint resolution inviting the United States to make the improvement.

The second objection urged is that "the policy of the Government in the past in the matter of transportation has not gone beyond the improvement of the natural water-ways." To this I answer that the policy of the Government has been to remove obstructions from water-ways or to get around them, if more convenient and effective, by the construction of canals; and that is still the policy. The

object in all cases has been to make continuous routes of water communication. If that can best be done by connecting two rivers by canal, as in the case of the Fox and Wisconsin, why not in the case under consideration to connect the more important waters of the Mississippi and Illinois?

The third objection is, "that the work contemplated, lying within the State of Illinois, is not of that importance entitling it to the dignity of a national character." From this are we to infer that because Hell Gate lies within the State of New York and the delta of the Mississippi within the State of Louisiana neither are entitled to a "national character?" This bill provides for the improvement of many rivers, by canal and otherwise, lying within the boundaries of single States, and yet they are dignified with a national character and appropriations are made yearly for their improvement.

The fourth objection is, "that as a remedy for the alleged evils of excessive charges for freight it is inadequate." If by this is meant that this improvement would not reduce the freight charges on all the railroads in the Northwest, it may be true; but if it means that it would not relieve a broad extent of country, and all of the patrons of the route, it has no foundation in fact or experience. As a matter of fact, the Illinois and Michigan Canal carries freight for less than one-half the price charged by the railroads not running parallel with it for equal distances, and all parallel roads along this line or near it carry freight for about one-half their charges on other and more remote parts of their lines. This improvement would be "adequate" to regulate freight charges to the extent of leaving in the hands of the producers and shippers millions of dollars yearly now paid to railway companies.

The sixth objection is "that the tendency of the times is averse to building canals, unless of great size, for the passage of large vessels." That I am willing to grant, but I insist that the Hennepin Canal comes within the exception. As compared with the old style of canal, it will be of "great size." It will float the average steamboat which plies the Upper Mississippi River. Its locks will be sufficient for all their purposes, and six feet of water will float them. The barges contemplated for this trade will be of large size and propelled by steam-tugs if found to be the cheapest power.

The seventh objection is that it will involve the enlargement of the Illinois and Michigan Canal, but I will come to that presently. The ninth objection is in the words, "should the Government enter upon the building of canals for transportation, thereby competing with common carriers, it would prove a check to private enterprise, on which the country mainly relies for its development, and inaugurate a policy which the past has shown to be subversive of the public good." Gentlemen are unnecessarily sensitive on this matter of competition. If there be any argument in this proposition it would apply to all inland water-ways as well as to canals. Private enterprise has built railroads running parallel with most of our great rivers, and yet the improvement of the rivers has not been opposed because they competed with the railroads.

Millions of dollars are appropriated by this bill for the improvement of rivers, the effect of which improvements is to be competition still more sharp with the railroads. There is nothing in "past experience" tending to show that this policy has been "subversive of the public good." To be consistent, on this theory, the improvement of all inland water-ways would be equally objectionable. I shall not now argue the question of water transportation for economy, as against transportation by rail for heavy commodities, as it has been established by experience and thorough investigation that the former is cheaper by about 50 per cent. If this were not so, why the vast expenditure contemplated by this bill?

But this objection confesses this in expressing the fear that the "competition" would be so great as to "prove a check to private enterprise." If the improvement would not materially decrease freight charges the competition could not be dangerous or "discouraging." If it would materially decrease the cost of transportation, as it would, and return to the producers and consumers in a single decade many times its cost, it would seem that the people who add to the wealth of the country by their labor and productive energy are entitled to it. I am a friend to railroads, and freely acknowledge that they have greatly aided in the development of the country. I would not construct a canal for the "sole and exclusive purpose" of competing with them, but if such construction would relieve the toiling millions of weighty burdens, enhancing the profits of the producer and furnishing cheaper food to the consumer, I would construct them.

Gentlemen need not be alarmed about undue competition with the railways of the Northwest. They are well managed and making money. Their business is increasing with the increase of production, and they will always have enough to do to give them ample profits. The fact is that in the busy season there is scarcely a road which can furnish cars enough to carry off the produce as fast as it comes forward. Their capacity, great as it is, is not sufficient for the business. The increase of production will be sufficient to employ all the railroads now existing and others yet to be built, even should the Hennepin Canal be constructed, and no gentleman need sell his railroad stocks in view of that contingency.

I do not advocate the construction of this canal as a "local benefit" to the people of Illinois. The people of Iowa would receive a

greater benefit by far than would the people of Illinois. The producers of Minnesota, Wisconsin, and Missouri would reap equally as great benefits as would the people of my State, while the benefits would reach far to the West, into Nebraska and Kansas. In my opinion the people of New York would receive as great benefits as would the mass of the citizens of Illinois, in that food would be furnished them cheaper than now, as it is one of the laws of trade that the savings in transportation are divided between the producer and consumer.

This minority report undertakes to show that the Hennepin Canal would not come within the rule which makes the "Louisville and Portland Canal, the Rock Island Canal, the Des Moines Rapids Canal, the Sault Ste Marie Canal," and other like works national in character, because, they say, "these are short lines of canal constructed to avoid natural barriers in long water-routes, though within the limits of certain States." The long route of which the Hennepin Canal would form a link extends from the Mississippi to the Atlantic seaboard. For a route so long, the link is a short and inexpensive one, the cost being estimated at less than \$4,000,000.

That this work is not local in character is evidenced by the action of boards of trade and chambers of commerce in different sections of the country, East as well as West, these bodies taking a broader view of the subject than do the gentlemen who signed this minority report. Among these are the Chicago Board of Trade, the Buffalo Board of Trade, the New York Board of Trade and Transportation, the New York Produce Exchange, Davenport Board of Trade, Duluth (Minnesota) Board of Trade; Chamber of Commerce, Saint Paul; Board of Trade, Minneapolis; Board of Trade, La Crosse; these latter in a section which this minority report claims has a shorter and better route by way of the Wisconsin and Fox Rivers to Green Bay, but which the original friends of that route know to be impracticable by reason of the caving of the banks of the Wisconsin River filling the channel, and for other causes. These bodies, as well as the indorsement of the press East and West, with striking unanimity favoring the work, supported by joint resolutions of the Legislatures of Iowa and Illinois, I submit, tends to give this work a national character, the gentleman from Ohio and the gentleman from New York to the contrary notwithstanding.

But these gentlemen find local opposition to this improvement coming from certain gentlemen representing a manufacturing interest at Sterling and Rock Falls, on the Rock River. The opposition is founded on the belief, or pretended belief, that the diversion of the water from the Rock River to the canal would impair the water-power at that point. These gentlemen have furnished the minority of the committee with a "protest" memorial or argument against the proposed canal, which is made a part of the report. As a whole and in detail it is a gross misrepresentation of facts and figures, setting forth among other things that the Hennepin Canal and the enlargement of the Illinois and Michigan Canal would finally cost \$125,000,000. So recklessly are figures used and assertions made, that I do not deem it necessary to go into details in view of its refutation. I will call attention to one statement of what purports to be a fact, and show the real facts in the case and dismiss this bombastic protest. In order to show that the manufacturers at Sterling and Rock Falls will be robbed of great fortunes by the diversion of water from their mills they are evidently at a loss for words, and put it in the following rather adroit form:

The loss to the manufacturing establishments by the destruction of the water-power could possibly be estimated by taking into account the sum of \$2,000,000 invested therein, and the sum of \$6,000,000 of manufactured articles shipped therefrom every year.

We venture to assert that it would not be possible to arrive at the loss on any such basis of calculation, because there is no such sum invested in manufacturing at that point, nor perhaps on the whole Rock River. They give the population as 8,000, whereas the census of 1880 gives both places less than 6,000. I have taken the pains to get from the county clerk of Whiteside County the assessed valuation of all the real estate upon which manufacturing establishments are located in Sterling and Rock Falls, and at Lynden, an adjacent village; also the personal property assessment of manufacturing firms and individuals for 1881. The statement includes all the hydraulic lots, though all are not used for manufacturing purposes, and if any factory is run by steam, that also is included. The following is the summing up of the assessment:

Lots:	
Sterling.....	\$41,390
Rock Falls.....	44,870
Personal property of firms, &c.:	
Sterling.....	23,752
Rock Falls.....	41,042
Manufactured articles:	
Sterling.....	12,585
Rock Falls.....	12,390
Lynden.....	8
Tools, machinery, &c.:	
Sterling.....	10,840
Rock Falls.....	7,805
Lynden.....	132
Total.....	104,614

Assuming that property in Illinois is assessed at only 60 per cent. of its value, add 40 per cent. to the above and we have the total value of the property \$272,739. Assuming that much of the personal property is not a part of the property connected with the manufacturing establishments, and that many of the lots thus assessed are not used by such establishments, the amount of money invested in manufacturing, on this basis of calculation, cannot exceed \$250,000, or one-eighth what is claimed by this committee. But it is not desired that this manufacturing interest shall be injured, nor is it believed that the diversion of the water sufficient to supply such canal as is contemplated would impair the value of such property.

The minority of the committee give as a further reason for their opposition to the Hennepin Canal that the constitutional convention of Illinois, in 1870, incorporated into the constitution of the State a provision prohibiting the Legislature "from ever voting to loan its credit to build this canal." Now, I submit in all candor that this is not a fair statement of facts. The constitutional provision is in the following words:

The General Assembly shall never loan the credit of the State or make appropriations from the treasury thereof in aid of railroads or canals: *Provided*, That any surplus earnings of any canal may be appropriated for its enlargement or extension.

It will be seen that this language is general and applies with equal force to all railroads as well as canals. The provision, I think, is a good one, and was ratified by the people, as were other provisions limiting the power of the Legislature.

The last objection of the minority to the Hennepin Canal which I shall notice is in the following language:

To make the said canal practicable the appropriation of immense sums of money will be necessary to enlarge its eastern extension—the Illinois and Michigan Canal.

I am in favor of completing the improvement of the Illinois River now under way, and of the extension of the improvements from the present head of navigation at La Salle to Joliet, a distance of 60 miles, and of the enlargement of the Illinois and Michigan Canal from Joliet to Chicago, a distance of 40 miles, so as to complete this great Illinois River route from the Lakes to the Mississippi. The whole distance is, I believe, only 96 miles, but I will consider it 100 to round the number. There has been much misrepresentation in regard to the probable cost of this work, and the minority report abounds in misapprehensions, to state it mildly.

There has been no separate estimate given the public, so far as I know, of the cost of this section of the Illinois River route, but General J. H. Wilson, United States engineer, made a survey in 1866 of the entire line, from the mouth of the Illinois River to Chicago, and in round numbers estimated the cost at \$18,000,000. It will be remembered that at that time material and labor were still at about war prices. The same work in all probability could now be done for one-third less, say for \$12,000,000. Since that time two locks and dams have been constructed on the Illinois River at Henry and Copperas Creek, of magnificent proportions, being 350 feet long between the gates and 75 feet wide in chamber. They will pass boats 300 feet in length and 73 in breadth, drawing six feet of water, with a capacity of 2,000 tons, or they will pass twelve canal boats, such as are used on the Illinois and Michigan Canal, being about the same as those used on the Erie Canal, at one lockage, having a capacity of 2,400 tons.

These locks and dams were built by the State of Illinois at a cost of \$757,854, in addition to which sum the United States expended \$43,358 in the foundations and lock-pit of the Copperas Creek dam. The State also paid all damages incurred by the overflow of land. Gentlemen will certainly concede that the State of Illinois, which thus expended more than three-quarters of a million of dollars in improving what is now conceded by all to be a national highway, did not show a spirit of parsimony.

These two dams insure seven feet of navigable water for a distance of 90 miles. The United States has undertaken the construction of two more dams, which, when completed, will insure seven feet of water from La Salle to the mouth of the river, 226 miles, more reliable than any equal distance on the Upper Mississippi River, at a total cost of about \$12,000 per mile, while the Erie Canal, with about one-twelfth its capacity, cost \$90,000 per mile. This expenditure of about two and a half million dollars would, of course, be deducted from the above estimate on the whole line. This, then, brings us within less than 100 miles of Chicago. Following the channel of the Illinois and Des Plaines up a distance of 60 miles brings us to Joliet. The channel is broad, the banks high, and the bottom of gravel or stone where bars do not form. That the United States has jurisdiction over this part of the route the most technical strict constructionist will not deny. This brings us within 40 miles of Chicago. These 40 miles are canal, which would require enlargement to correspond with the other parts of the line. It is conceded that this part of the work would be the most expensive in proportion to its length, but it must not be forgotten that since the above estimates were made \$3,000,000 were expended in what is known as the "deep cut" on this section. The waters of Lake Michigan now flow freely down the canal, the channel of which is five feet in depth. Of course this channel would require to be made at least seven feet in depth and three times its present width to admit the passage of boats of large size.

That this is a work of national importance and character is an opinion long entertained, and is sustained by Congressional action. In 1827 Congress granted to the State alternate sections of land on either side of the canal to aid in its construction. While it is true that the aid thus granted was a material help as well as a recognition of the national character of the work, the reserved sections were sold at double the price fixed by law for Government lands, and the money thus paid by citizens of Illinois reimbursed the United States for any possible loss. The necessity of at least one grand water-route connecting the lake system of navigation with that of the Mississippi has been felt by prominent statesmen for many years. While we are pointed to three or four other canals connecting the lake with the river system, and are told that boats have passed from one to the other, which I have not time now to discuss, I say, without fear of successful contradiction, that the Illinois River and this section of the Illinois and Michigan Canal constitute not only the best, but the only short, practicable, and, considering its importance, cheap route by which the steamboats of the Mississippi River and its tributaries can pass freely into any lake port. Its consummation would unite the vast commerce of the lakes with the 14,000 miles of river navigation on the Mississippi and its tributaries, ramifying the whole Southwest. The completion of the improvements of the Illinois River, now under way, will leave only 100 miles of this grand water-way uncompleted, which it is believed can now be done at a cost not exceeding \$8,000,000.

The commerce of this route, with the present limited capacity of the canal and the river improvements incomplete, is large and increasing. Of the arrivals and departures of boats at Saint Louis one-eighth are from the Illinois River, more than from all other rivers save the Upper and Lower Mississippi. The freight arriving at Saint Louis by this river, taking an average of five years, has been 155,000 tons a year, being one-fifth of all the freight arriving by western rivers and one-twentieth of all received by rail from the fifteen roads centering there from all directions. Of the vast quantities of corn received in Chicago one-eighth comes by canal, and one-twelfth of all the lumber sent out goes by the same route. These figures are taken from the report of Daniel C. Jenne, chief engineer to the canal commissioners, and are official and reliable.

The established rates for freight by rail for distances equal to that between Chicago and Saint Louis (370 miles) is 11.91 cents per bushel for wheat; 11.14 cents for corn; and 6.25 per thousand for pine lumber, which is more than double that now charged by canal and river, notwithstanding tolls are now charged. In regard to the advantages of this route, Mr. Jenne says:

With these locks and dams built, this river will become one of the most important channels of trade in the United States, and perhaps in the world. At all seasons of navigation, steamboats, tugs, barges, and other water craft drawing six feet of water can navigate the same, and with this increase of depth can more successfully compete for the carrying trade than any other route, and produce a great saving in cost to the shipper and producer. * * * Its capacity for commerce will be very much larger than the Erie Canal, as twelve of those canal-boats could pass through the locks at the same time.

It has been intimated that the Illinois and Michigan Canal "hardly pays expenses," and that that is the reason why the State is anxious to "get rid of it." To this I have only to say that the tolls are so low, made so purposely, as to fairly cover expenses, but that since the completion of the work in 1848, the canal has paid into the State treasury, over and above the cost of construction, maintenance, and improvement, the sum of \$2,262,049. The State does not want to get rid of the canal except on the condition of its enlargement in aid of commerce. Believing this to be a national and not a work of mere local importance, the State of Illinois, by legislative enactment, has ceded to the United States this canal on the above condition, subject to the approval of the voters at the next general election.

In view of all these facts I ask that a provision be incorporated in this bill for a survey of the Illinois and Des Plaines Rivers from La Salle to Joliet, and of the canal from Joliet to Chicago, and that an estimate be made, under the direction of the Secretary of War, of the cost of the improvement. I think this much is due to the State of Illinois as well as to the interests of commerce.

This bill proposes to appropriate \$300,000 for what is called the reservoir system of the Upper Mississippi River. I shall not now argue against the feasibility of that scheme. It is proposed to build dams to confine the waters of certain minor lakes, to be drawn off to supply the river in aid of navigation when at low stages. I only wish to say that we offer you the grandest reservoir on the continent with dams already built. We offer you the chain of great northern lakes from which you can draw an amount only limited by the capacity of the channel you may dig. We cannot turn this water into the Mississippi above the mouth of the Illinois, but below that point the flow can be materially increased. From Joliet to Chicago, only forty miles, there is a fall of twenty-seven feet. If you want water, in any quantity, the blue waters of the lake will come at your bidding. The time will come, and I think at no distant day, when this short link of forty miles, now called a part of the Illinois and Michigan Canal, will be so enlarged as to merit the name of river, and when steamboats with full cargoes from New Orleans and other Southern ports will be seen moving upon its waters to and from the great metropolis of the Northwest.

River and Harbor Appropriation.

SPEECH

OF

HON. ROSWELL P. FLOWER,

OF NEW YORK,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, July 25, 1882,

On the bill (H. R. No. 6242) making appropriations for the construction, repair, and preservation of certain works on rivers and harbors, and for other purposes.

Mr. FLOWER said:

Mr. SPEAKER: Although comparatively inexperienced in legislation affecting the whole country, I have considered it my duty to enter several protests against the excessive and burdensome taxation under which we are laboring, and I gladly avail myself of this unlooked-for opportunity of renewing and reiterating what I have already defined to be my convictions. There ought to be and must be a reduction in taxation and a diminution in the revenues of this Government if justice and true economy are to hold any place in it.

There are altogether in this broad land of ours some 50,000,000 of men, women, and children, or perhaps 10,000,000 families, who depend on the Government for that legal protection which it is the duty of good governments to afford good citizens, and from those 10,000,000 families during the last year have been extorted \$400,000,000, or, in round numbers, \$40 from each family.

Now, I have not the least hesitancy in affirming, as has already been affirmed by those competent in every sense of the word to estimate and affirm, that \$250,000,000 are ample to supply the ordinary wants of the Government if properly administered; and the sinking fund and public debt, as I have already shown, do not by any means require as much as \$50,000,000. It seems to me, then, that for all the needs of the Administration \$300,000,000 would suffice; but it does not suffice and can never suffice for the lavish expenditures contemplated by such unnecessarily enormous appropriation bills as this river and harbor bill.

And it is in this surplus of revenue, this extra and unnecessary \$100,000,000 or more, that such monstrosities of legislation have their beginning. One hundred million dollars of money arbitrarily placed at the disposal of a government, and which it must devise ways and means to spend, is sufficient to overturn every foundation of democracy and blast every principle of honest administration.

But there is another very important side to the question which it is well for us to consider when we are called upon to vote such sums as these for such purposes, and that is the side of the tax-payer. The \$100,000,000 which I have spoken of as unnecessarily collected means even more than corruption. It means absolute deprivation to every family in the land. It means \$10 drawn from the earnings of each head of a family. It means a \$10 tax levied without excuse in addition to all the taxes, municipal, State, and Federal, to which the laborer is subject, and it means war taxes in times of peace.

Sir, when we were at war, when we were obliged to spend vast sums to preserve intact the glorious heritage of our fathers, there was an excuse for taxation and large revenues, and the people of this country responded nobly to the calls that were made upon them. To-day they are still generously rewarding the wonderful sacrifices which our soldiers made in our common cause. But though the obligations incurred by the war have been so reduced by generosity and liberality in season that there would seem to be an opportunity for affording the people a rest or comparative rest from the strain which they have so long endured, no rest is proposed, no diminution of burdensome taxation is in sight.

When the Government was laboring and in danger the people supported it with their lives and their property, and when it has been rescued from destruction and enriched it must luxuriate, and they must labor as though still in the actual contest. It seems to me that it would be fairer to economize in the administration and allow the people to enjoy their own, than that public officials should wallow in the ill-gotten gains of unnecessary taxation or that legislators should be lavish with other people's money.

I think I am justified in saying that lavish expenditure of money is scarcely acceptable when the man who worked for the money sees other men working to get rid of it for him, and I know I am right in asserting that it is wrong that there should ever be such a spectacle.

Mr. Speaker, when I think of the men in my own city and elsewhere who at wages of from \$1 to \$2 per day are obliged to save and scrimp to get a good dinner for themselves and their families once a week, when I think of the low rate of wages which prevails, when I read of children carrying blocks of wood tied up in a handkerchief to school to make believe they have luncheons, when I see men walking miles to their work to save the small sum a street-car ride would cost, I am sad.

When I think of the high rate of meat and vegetables and the comfortlessness of hungry toil; when I reflect that to gain scanty pittance, even to live, the laboring-men of this country are obliged to undergo and are now undergoing long and fierce contests with their employers, I am dissatisfied. But when I remember that all capital is the result of labor, when I am sure that all taxes are ultimately paid by laborers, when I think of these fundamental axioms of political economy, and then think of the exorbitant demands and lavish disbursements of this Government, I am astounded.

Can it be possible that this state of things can continue; that the national protectors of the men of this country and their sworn representatives will so misuse their powers? I trust not.

Mr. Speaker, this bill contains provisions which, in my judgment, are good, which would be of material benefit to the country; but it contains others which are pernicious and for which I cannot vote. As a whole it is a gigantic swindle upon the people. It has grown from the surplus of revenue, which ought not to be. It has become vast and abnormal on the "tit-for-tat" principle. Clauses have been allowed to creep in so that other clauses might be retained, and its face bears the "you vote for mine and I will vote for yours" stamp.

I hope the bill as it now stands will not pass. I hope it will be vetoed if it does pass.

South Carolina Election Contest—Smalls vs. Tillman.

SPEECH

OF

HON. ROSWELL G. HERR,

OF MICHIGAN,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, July 19, 1882.

The House having under consideration the contested-election case of Smalls vs. Tillman—

Mr. HERR said:

Mr. SPEAKER: I wish to invite the attention of the members of the House, and more especially of the gentlemen from South Carolina, for a few moments to some facts and suggestions which may not at first seem to relate directly to this case, but which, when examined carefully, will be seen to have a direct bearing upon the question now being investigated.

Before entering upon this work I wish to say that no man recognizes more clearly than I do the great principle laid down in all our law books, that every man should be presumed to be innocent until he is proven to be guilty, but where public opinion sits in judgment upon an individual it is possible for a man's past life and conduct to be so bad that this rule becomes reversed. The same thing may also be true of entire communities. The people of any section of country may be guilty of such a system of oppression and wrong, may follow a course of such persistent and determined fraud and wrong-doing, that, when they are charged with any of that class of crimes, the presumption instantly follows that they are guilty of the acts charged.

A man may become such a constant and notorious outlaw that the moment any villainy is perpetrated in his immediate neighborhood the presumption follows instantly that that man probably had a hand in the business. And so a community may follow such a course toward certain of its citizens that the moment any outrage is committed upon the rights of that particular class the presumption follows at once that the people of that community are the authors of the outrage, and the burden of proof is at once shifted to the defendants in such cases. Owing to the volume of terrible things they have done in the past the ordinary legal presumption is changed, and the entire people readily believe that they are guilty as claimed, simply because it is in exact keeping with their past lives.

I have here a map showing the recent redistricting of the State of South Carolina. In discussing the Lowe and Wheeler case I stated in reference to South Carolina, Mississippi, and Alabama, and other portions of the South, that the party now in control there so managed as to make every fair-minded man believe that they were ready and willing to adopt any plan, no matter how wicked and outrageous it might be, to keep political power in the hands of a few men, and to prevent it from passing into the hands of the actual majority. I stated that there was a class of men in those sections who claimed that they had a divine right to rule, and that they were justified in resorting to any trickery, fraud, or even violence, if it seemed necessary to do that, in order to keep power in the hands of this dominant class or race. I then cited some acts of those people to substantiate that statement. In further proof of that position I have here a map of South Carolina, showing the Congressional districts as they have just been arranged by the Legislature of that State. I will ask the

Clerk to hold it up, so that the members may all see the beauties of this scheme. [See Diagram No. 1—Map of South Carolina.]

Now, I claim, Mr. Speaker, that that map is a stump-speech of itself and an elegant one too. Please follow me while I point out some of its wonders. First let me call your attention to the first district. It seemed for some reason that they desired to take into that district the city of Charleston, so they run down this narrow neck [indicating] and take in that city; and then with a still narrower strip they run up along the coast of the ocean forty or fifty miles here to McClellanville, and take in some two hundred Democrats in that village.

Let us next examine this seventh district. The district commences here at the southern border of the State and includes all this large territory running up here to Charleston Harbor, including these islands; and then crossing the harbor it runs along this strip between high and low water mark up to McClellanville, and then off into this queer shaped country. I have the bill here in my hand, and it makes the boundary line the high-water mark of this coast, so at high tide the connecting link is under water entirely. [Laughter.] Then take a look at the general outline of this district. See the indentation here, the zigzag there; the broad expanse here, the narrow strip there.

But you cannot understand these districts properly unless you see them standing out alone, each one by itself. I have here a diagram representing them to a dot. Here is district No. 7 in all its proportions. [See Diagram No. 2.]

Now, you would not think that district possible unless you could see its mate, No. 1. Here it is. [See Diagram No. 3.]

They are not twins, but they do match each other beautifully. [Laughter.] You would have no use for this leg and foot on No. 1 if you did not have this boot in No. 7 for it to slip into. [Laughter.] Now, look at the enormous size of this district No. 7. It must include quite one-fifth of the State. I find upon examination that it contains over 187,000 people, being 69,000 more inhabitants than are in the smaller districts. What object could there be in making such an enormous district as that in territory and population? A short examination of the census tables will show. I will insert here a table showing the white and colored voters of each district:

District.	White.	Colored.	White majority.	Colored majority.
First.....	12,445	13,884	1,439
Second.....	11,446	16,283	4,837
Third.....	13,359	12,707	652
Fourth.....	17,670	16,985	685
Fifth.....	11,805	12,009	204
Sixth.....	12,480	13,468	988
Seventh.....	7,695	32,893	25,198
Total.....	86,900	118,889	1,337	33,336

You see by that table there are 25,198 more colored voters in that seventh district than there are white voters. In that first district there are only 26,329 voters; in the fifth district only 24,474, while in this marvelously shaped seventh there are 40,588 voters! Thus you see this game becomes apparent. They started out with this seventh district and run it in all directions, without regard to county lines or town lines or voting precincts, simply with one purpose in view, that of collecting into one district all the colored voters possible and thereby preventing their votes from being felt in the other districts. And such work as that is called redistricting a State according to law!

Mr. DUNN. Is that evidence in this case?

Mr. HERR. It is a part of the evidence, and before I get through I will show you a much stronger link between this proof and the case we are now trying than there is between the different portions of some of these districts. [Laughter.] If you do not believe it look at these diagrams of districts Nos. 3 and 4. [See Diagrams Nos. 4 and 5.]

You will notice that the only connecting link between the two portions of this third district there is a mathematical point where their corners touch. Brother J. HYATT SMITH, of New York, who is so well versed in biblical lore, gave me the following passage from the Hebrew Decalogue: "Thou shalt not make unto thyself any graven image, the likeness of anything in the heavens above, or the earth beneath, or the waters under the earth." Now, I submit to this House whether there could be, by any possibility, idolatry in worshipping either of those four districts. [Laughter.]

For the edification of the House let me read from the bill, a certified copy of which I hold here in my hand, the description of this remarkable first district.

The first Congressional district to be composed of the county of Charleston, except James Island, Folly Island, Morris Island, and the islands lying between them; the lower harbor of Charleston Harbor and the ocean coast line from and below high-water mark; the towns of Mount Pleasant and Summerville, and so much of the parish of Saint James, Goose Creek, as lies between western track of the South Carolina Railway and the Ashley River in the county of Berkeley and

DIAGRAM NO. 1—MAP OF SOUTH CAROLINA.

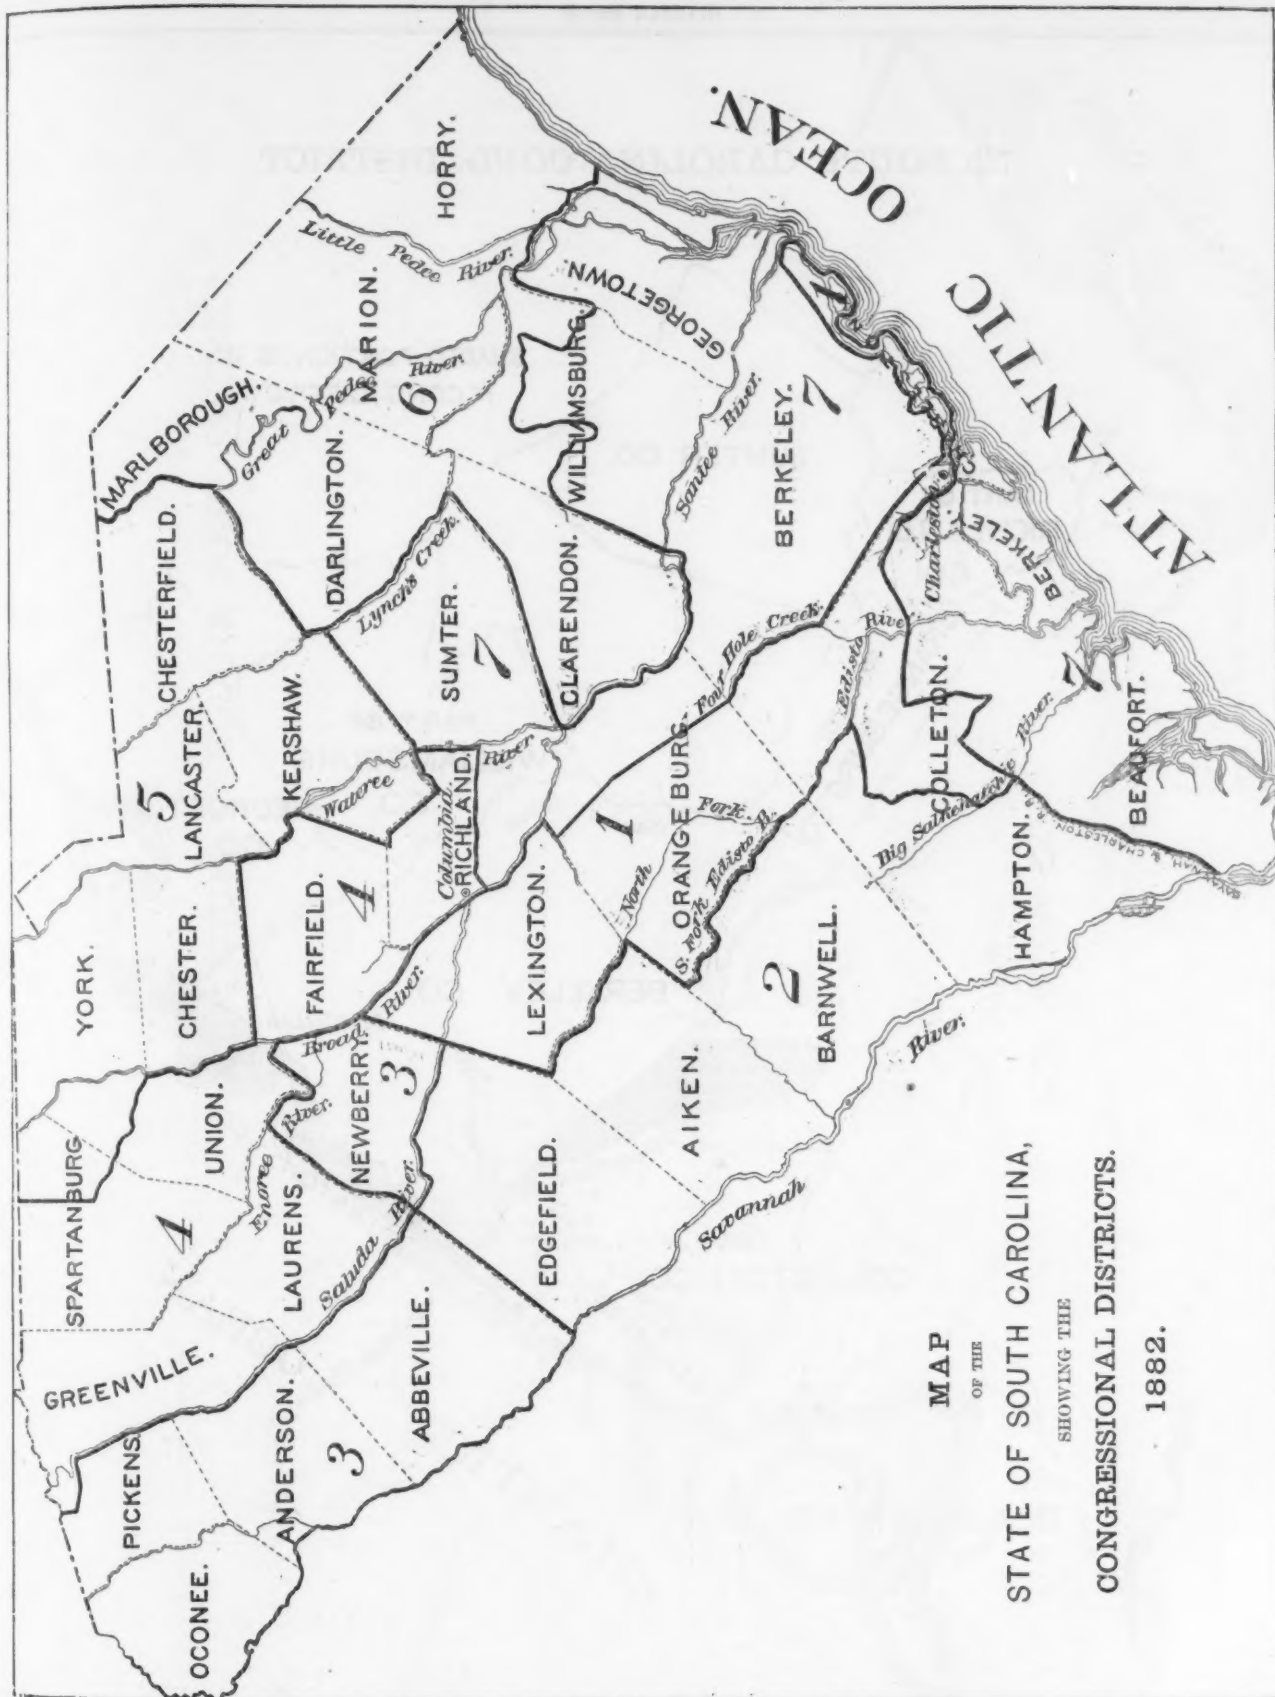

DIAGRAM No. 2.

7th SOUTH CAROLINA CONG. DISTRICT.

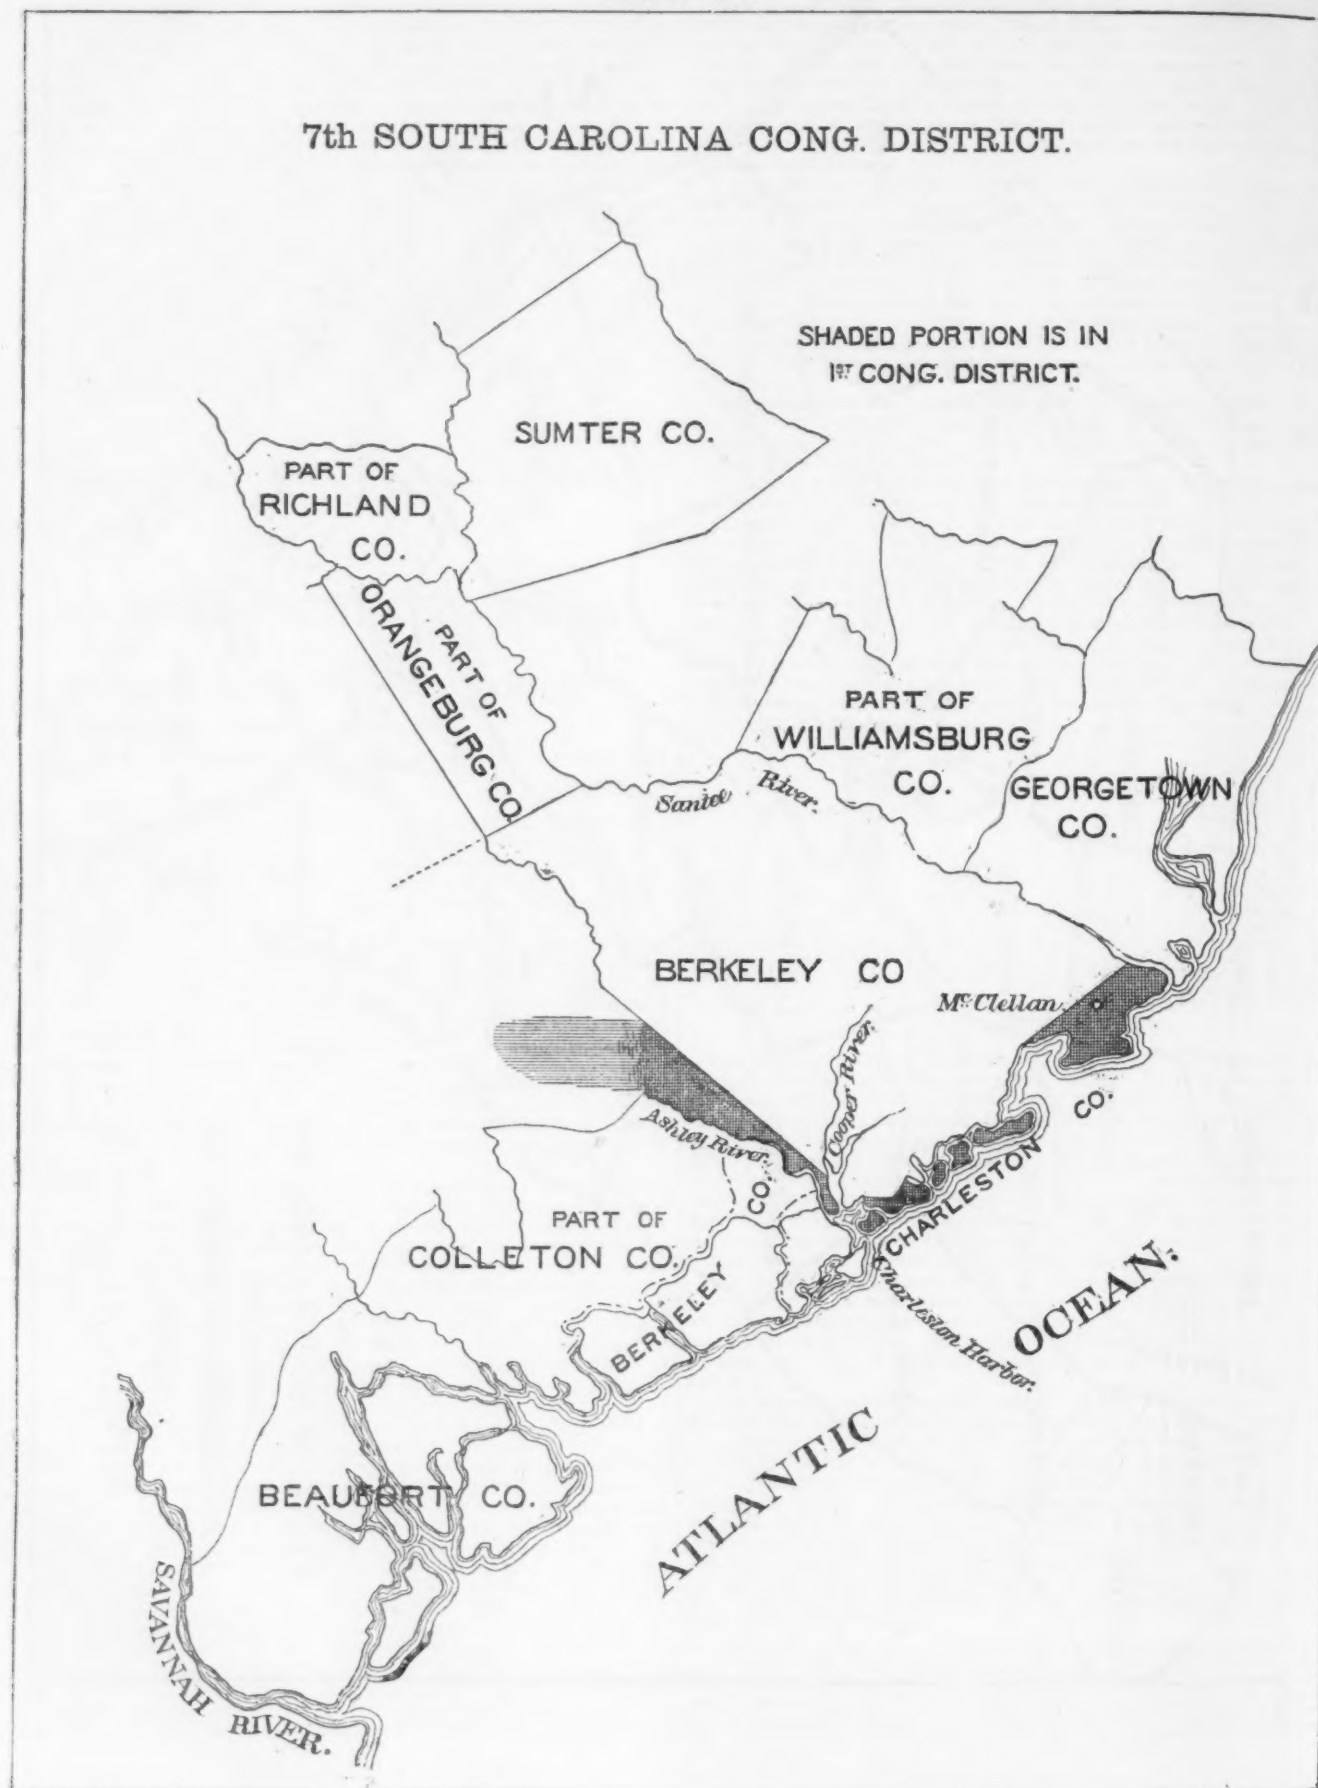

DIAGRAM NO. 3.

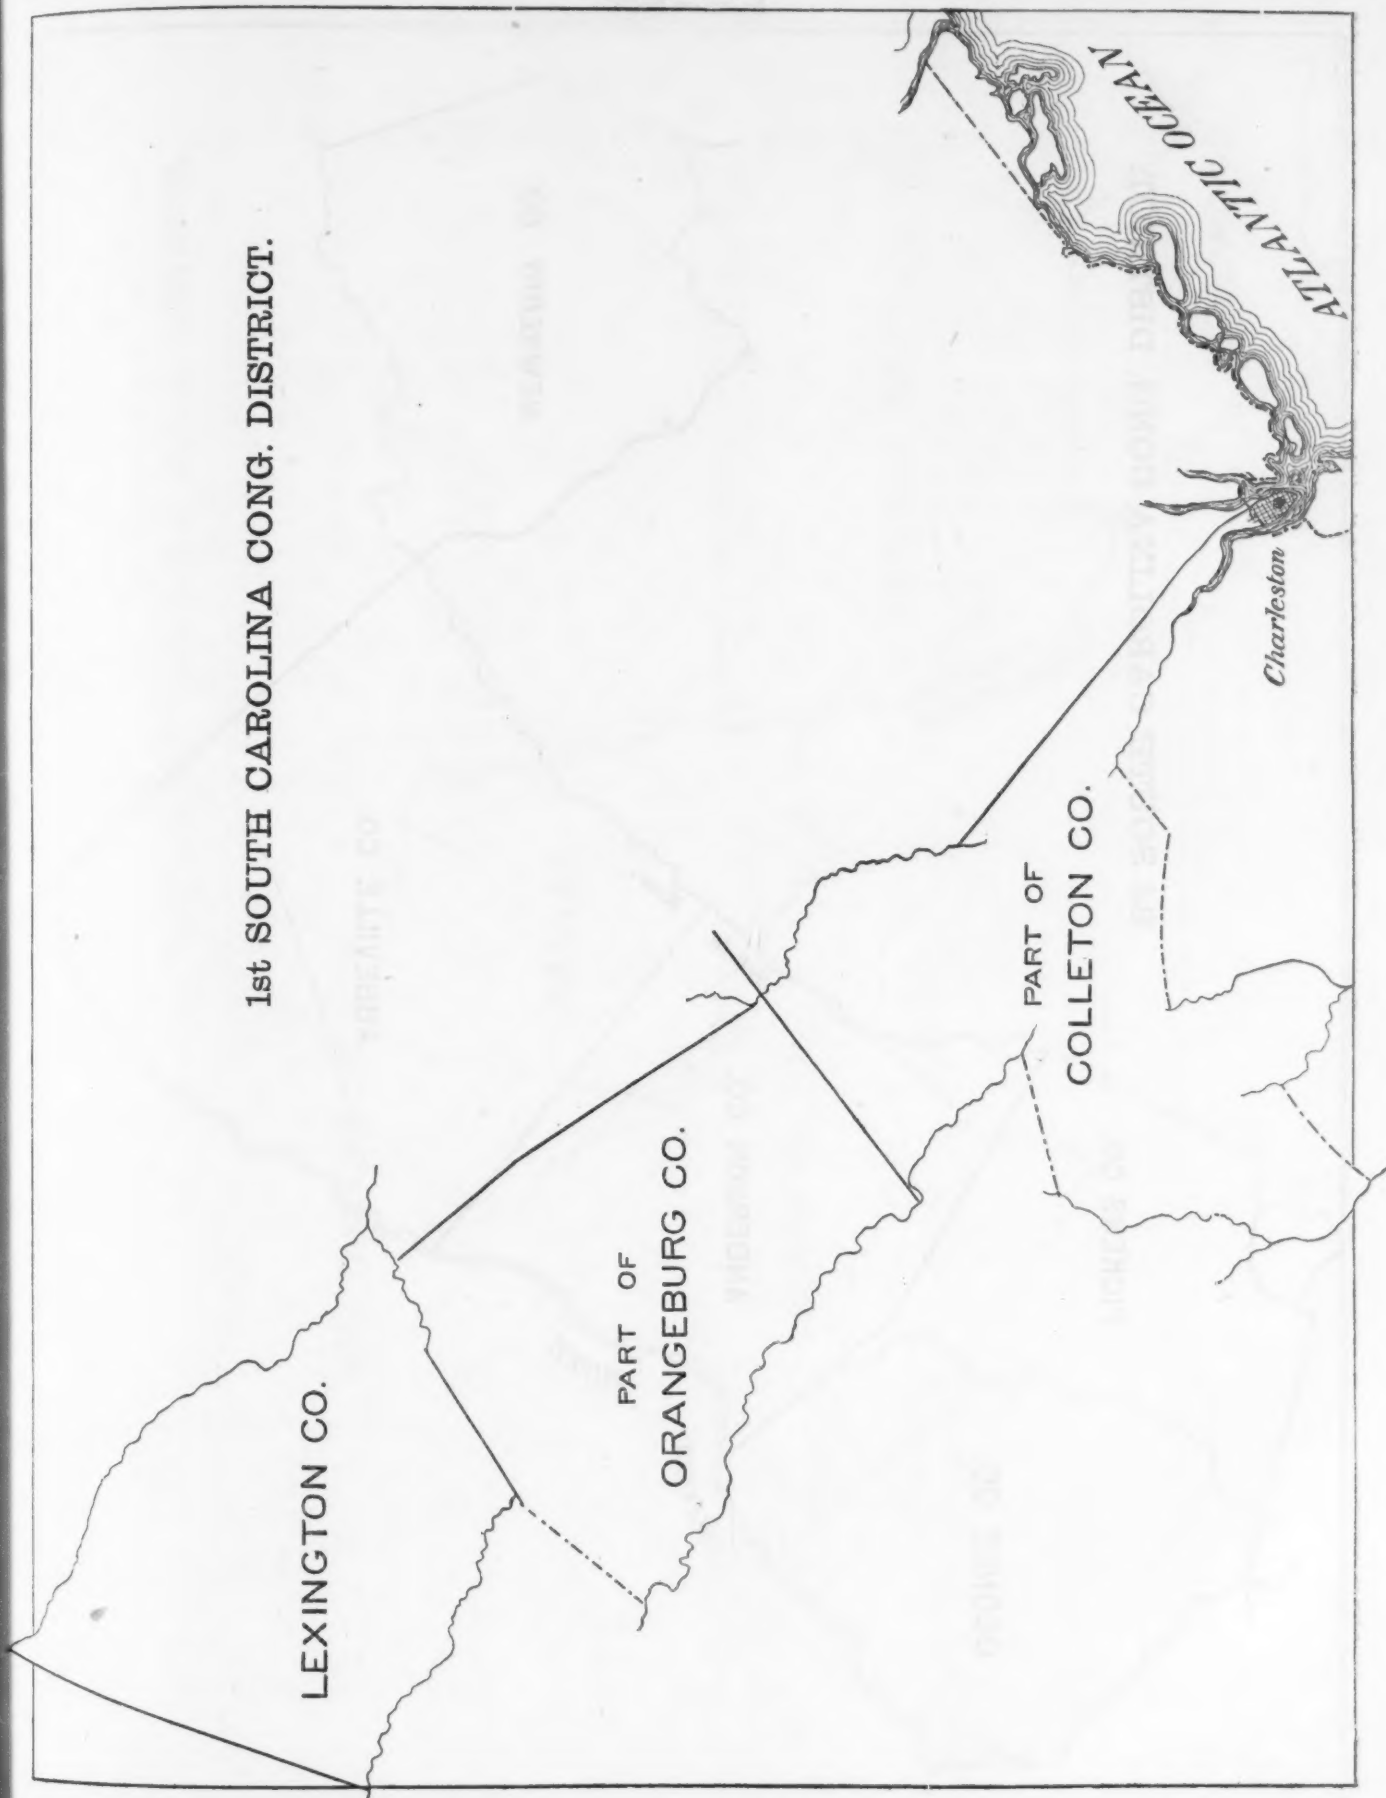

DIAGRAM NO. 4.

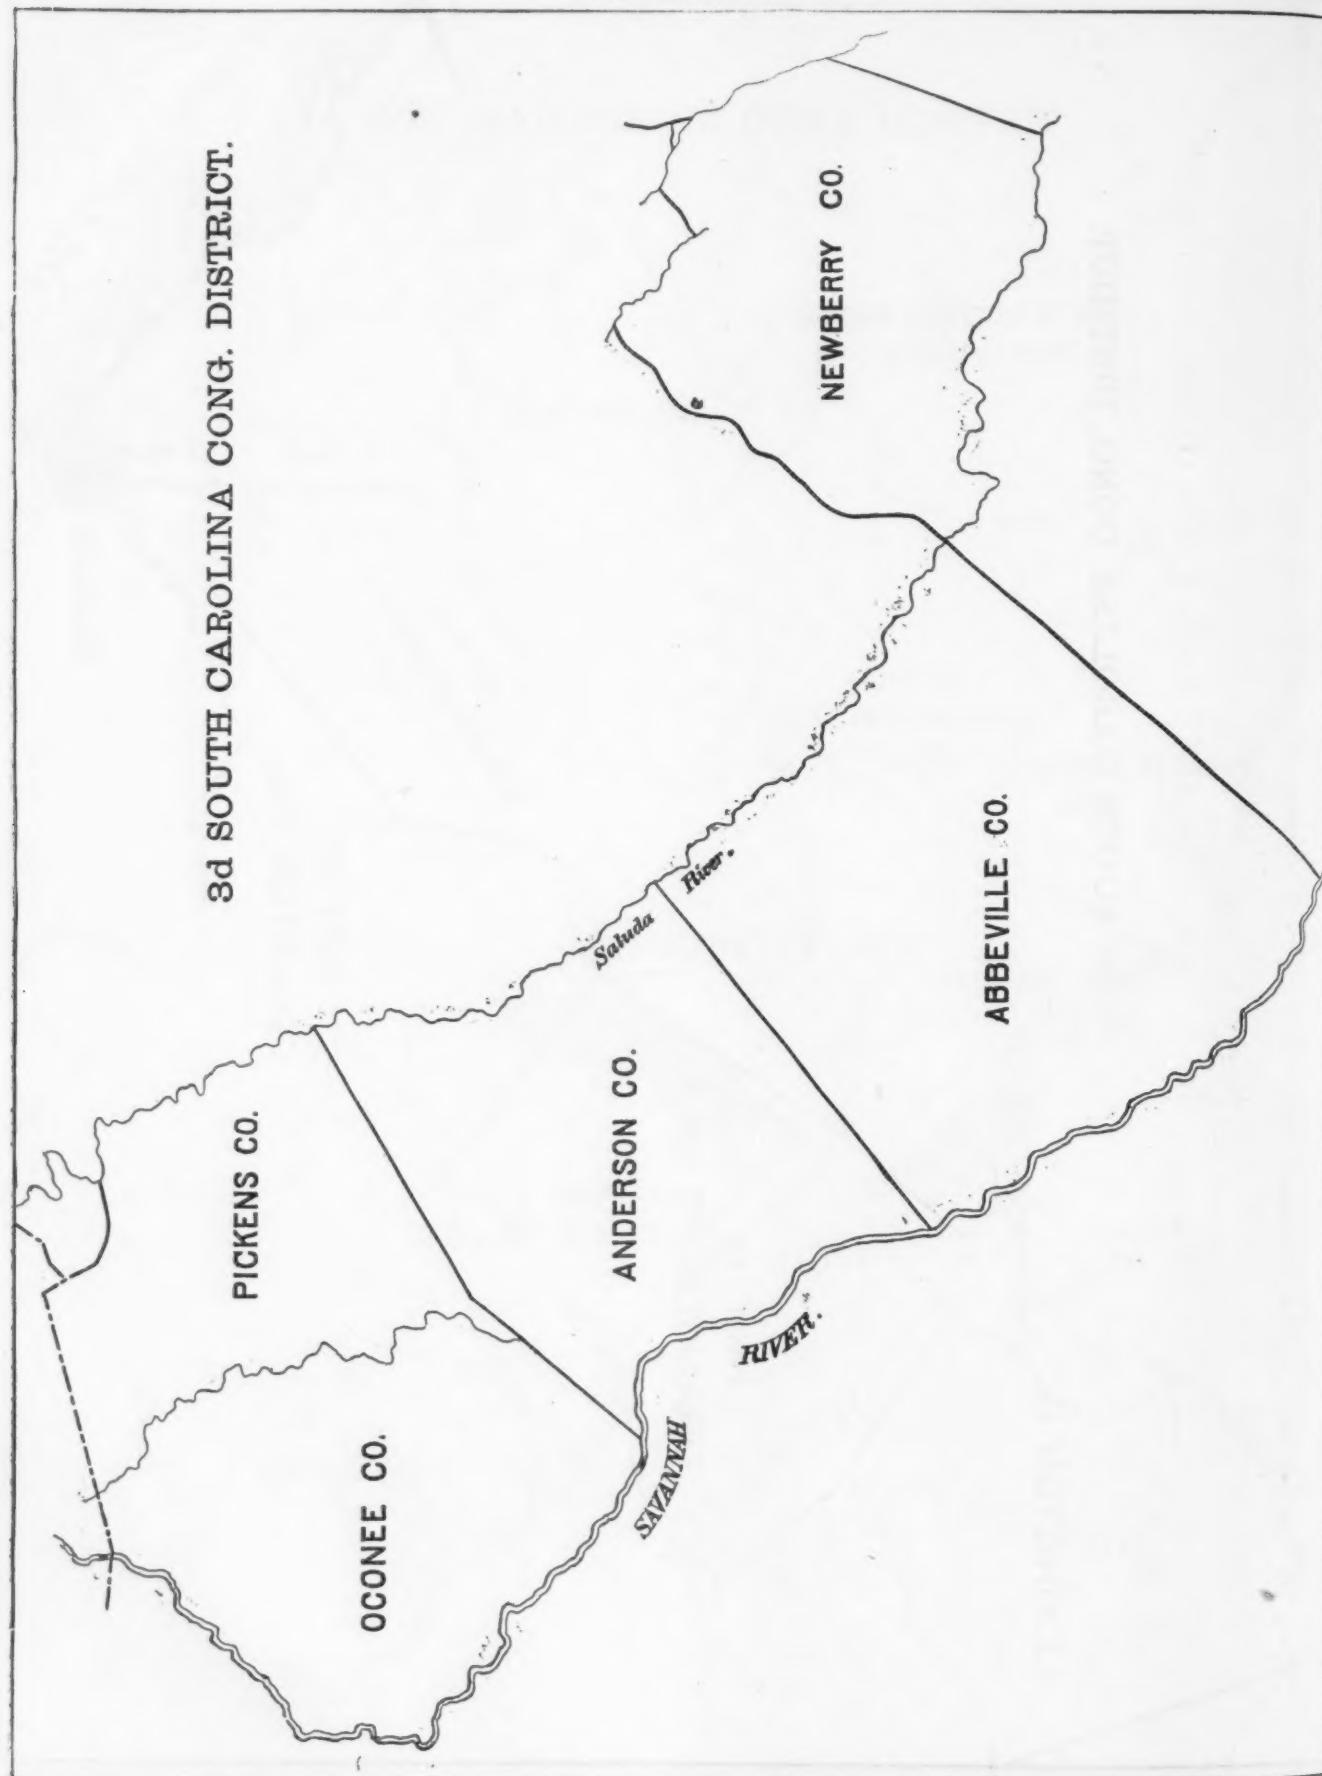

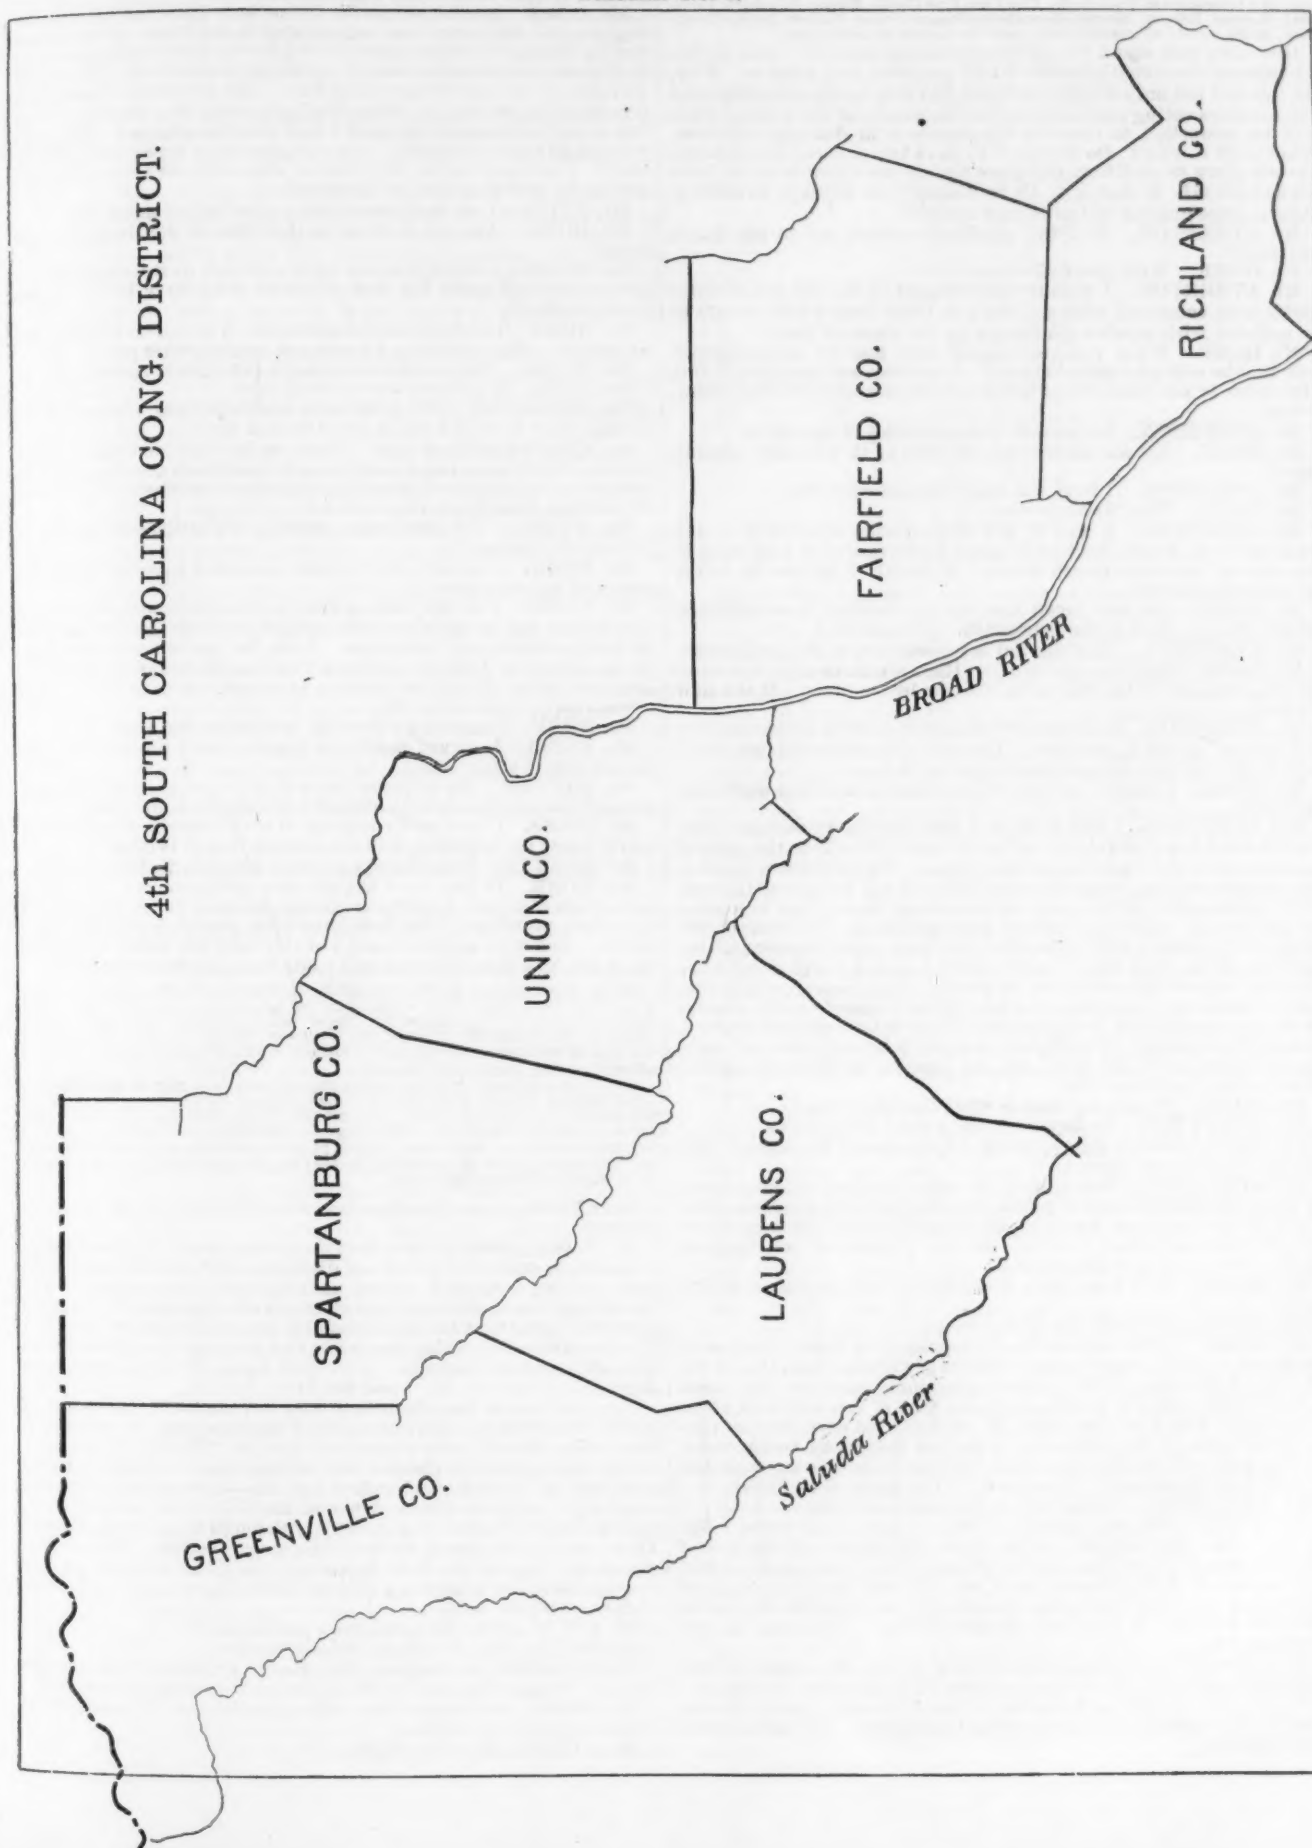

DIAGRAM No. 5.

below the county of Colleton; the townships of Bells, Burns, Conn, Dorchester, George, Graham, Heyward, Roger, Sheridan, and Verdier in the county of Colleton; the townships of Branchville, Caw Caw, Caw Castle, Edisto, Elizabeth, Goodland, Hebron, Liberty, Middle, New Hope, Orange, Union, Willow, Rocky Grove, Zion, in the county of Orangeburgh; and the county of Lexington.

How does that sound for one Congressional district? And the description of the seventh district is like unto this, only more so. Why, sir, this bill not only divides counties, but it splits up townships and even sunders voting precincts, so that the people of one polling place will be compelled to vote for Congressmen in different districts. What is all this for? Do they seek to have two or three ballot-boxes at each place so that they can more readily use a double set of these tissue ballots? Is that it? Or is it simply an attempt to disfranchise a large number of the colored voters?

Mr. ATHERTON. Will the gentleman permit me to ask him a question?

Mr. HERR. With great pleasure.

Mr. ATHERTON. I wish to ask in regard to the fairness of those districts as compared with a district in Ohio from which we are to be inflicted with another gentleman by the name of Horr.

Mr. HERR. When you are inflicted with him let me notify you now that he will take care of himself. [Applause and laughter.] But permit me to add that I have had much experience with Ohio Democrats.

Mr. ATHERTON. Let me ask the question you agreed to.

Mr. HERR. Let me answer first the end of it you have already asked.

Mr. ATHERTON. I have not asked the question yet.

Mr. HERR. Very well; go on.

Mr. ATHERTON. I wish to ask the question whether it is any more unfair in South Carolina to make districts of that kind than in the case of the seventeenth district of Ohio? I believe it is the seventeenth district.

Mr. HERR. Do you mean the one my brother is about to be elected from? That is the fourteenth. [Laughter.]

Mr. ATHERTON. That district is represented by Judge GEDDES.

Mr. HERR. Only one county of it; there are three other counties, two represented by Mr. McCURE and one by Dr. RICE. It is a new district.

Mr. ATHERTON. It is represented now in part by Judge GEDDES and in part by other members. The new district would naturally take with it as now formed the county of Holmes.

Mr. HERR. I cannot permit all my time to be taken up by one question.

Mr. ATHERTON. The district I now represent contains four counties and has a population of more than 5,000 above the ratio of representation for a member of this House. The adjoining district, now represented by Judge GEDDES, has in it the county of Holmes. That being added to the new district would leave that adjoining district largely below the ratio of representation. It naturally belongs to the district which the other Mr. Horr would represent. Instead of adding that county to his district, making both districts as near the ratio of representation as possible, that county, which contains a Democratic majority of about 2,000, is added to my district in the last Republican gerrymander. They take it off that district, leaving that district with 127,000, and put it into my district, making it 177,000, or 50,000 more, for the purpose of electing another Horr to Congress from Ohio.

Mr. HERR. Do you say that is what they did it for?

Mr. ATHERTON. He happens to be a good Republican.

Mr. HERR. That is a good reason why he should be elected. Are you done with your question?

Mr. ATHERTON. Would it not be better for the gentleman when he talks about unfairness of parties in arranging Congressional districts to shoot at home where the Horr family lives than to go down into the State of South Carolina for the purpose of pointing out similar things, even if they exist?

Mr. HERR. Well, I am truly thankful if your question is finally asked.

Mr. EVINS. I should like to know—

Mr. HERR. I will come to the gentleman from South Carolina in a moment. Let me get through with the gentleman from Ohio first. I have not the maps of the various apportionments heretofore made in Ohio before me, but I will guarantee that if you will look them up you will find that the worst job of that kind ever done in that State was done by the Democrats in the last decade, by far the worst looking map of that kind ever made in that State was made at that time by you Democrats. [Laughter.] You know that, Judge.

Mr. ATHERTON. Not as bad as this one I have mentioned.

Mr. HERR. Oh, yes, indeed! It was a great deal worse. But you may take that map, as bad as it was, and place it by the side of this one of South Carolina, and while the Ohio map was the worst the Democrats of that State could do, you will find they confined themselves to gerrymandering simple and pure, while this South Carolina business is pure and simple villainy. [Applause on Republican side.]

The men who would prepare such a map as that, who would divide townships, split in two precincts—worse than that; here in this seventh district, in Charleston Harbor, in order to make a land connection you are compelled to tunnel under that harbor. [Great laughter and applause.]

Mr. ATHERTON. Is it any worse to disfranchise 50,000 people in South Carolina than 50,000 Democrats in Ohio?

Mr. HERR. Let me assure my friend from Ohio that no such outrage as this has ever been perpetrated in his State. You cannot find on the face of these entire United States another such attempt to disfranchise an entire race of people as is shown by this recent division of the State of South Carolina. The gentleman from South Carolina [Mr. EVINS] the other day said to me that South Carolina had never yet done anything of which she was ashamed. This map was not at that time made. Can the gentleman repeat that remark now? [Applause on the Republican side. Mr. EVANS rose.] Are you in favor of that kind of business?

Mr. EVINS. I am in favor of doing what is just and right.

Mr. HERR. Are you in favor of that kind of districting in your State?

Mr. EVINS. I think it is but right and just, as it is exactly what the gentleman's party has done wherever they have had an opportunity to do it.

Mr. HERR. The gentleman is mistaken. You cannot find its equal anywhere. Most certainly I never saw such another case.

Mr. EVINS. The gentleman stated a little while since—

Mr. HERR. I have no time to yield now.

Mr. ATHERTON. The gentleman had better pay some attention to that Ohio district I called his attention to—

Mr. UPDEGRAFF, of Ohio. There is in Ohio no Congressional district which bears any resemblance to that South Carolina district, and no one not composed of contiguous counties without any division of counties, townships, or precincts.

Mr. EVINS. The gentleman stated a while ago— [Cries of "Order!" "Order!"]

Mr. HERR. I cannot yield further, because I have but a few moments of my time left.

Mr. EVINS. I do not wish to deprive the gentleman of any part of his time, but he stated a while ago that in South Carolina we have divided precincts and townships. Now, the gentleman is mistaken. No precincts are divided. In South Carolina the counties are usually double or triple the size of counties in other States and a number of townships have been cut off—

Mr. HERR. I cannot yield to the gentleman for a speech.

Mr. EVINS. I am not making a speech, but I presume the gentleman wants all the facts.

Mr. MACKEY. My colleague says that no precincts are divided. Mount Pleasant precinct, in Berkeley County, was divided.

Mr. EVINS. I have no knowledge of such a thing; and of course, while I may be mistaken, I do not believe that it is done.

Mr. MACKEY. I could name a dozen which have been divided.

Mr. HERR. If you have not divided precincts and townships, pray what did your Legislature mean by their bill? Let me read the exact provision of the law framed by your Democratic Legislature. Listen to sections 2 and 3 of this very bill which divided up the State into these districts and made these diagrams possible:

SEC. 2. In every case in which under the provisions of this act the townships or parts of townships of any county may not all be in the same Congressional district, it shall be the duty of the proper board of county canvassers of such county in canvassing the votes of said county to report separately the results of the vote of such townships or part of townships for the Congressional district to which they may respectively belong.

SEC. 3. In any case in which a voting precinct may form part of more than one Congressional district, if no other provision be made by law the commissioner of election for the county in which such precinct is situated shall provide for such precinct separate boxes for every Congressional district within which the said precinct may be, and each voter at such precinct shall deposit his ballot for member of Congress in the box provided for the Congressional district within the limits of which said voter may reside.

Mr. EVINS. I presume that has reference exclusively to county officers.

Mr. HERR. I beg the gentleman's pardon, that is not what it says. It expressly states Congressional districts; and these separate boxes have nothing to do with county matters, nor is it possible for the law to apply to anything except elections of Congressmen. It seems beyond dispute that the makers of this law at least feared they had divided towns and voting precincts, else no such provisions would have appeared in their bill. Why, look again for a moment at the diagrams of districts No. 1 and No. 7!

For some reason they desired to take in Charleston in one end of No. 1. That split the territory of No. 7 plumb in two. It would seem that it had already been determined that No. 7 should include most of the negro votes in the east half of the State. To do that they must run the district two hundred and fifty miles up and down the coast and jump the Charleston and McClellanville strip of No. 1, which runs its crooked length entirely through the seventh district. These men do not stop at trifles. The strip of territory and the constitutional barrier are both passed at a single bound, and No. 7 is formed, taking in a majority of over 25,000 negro voters and a population of 187,600 souls.

Mr. EVINS. Will the gentleman permit me—

Mr. HERR. No; I cannot yield any further.

The SPEAKER *pro tempore*, (Mr. SMITH, of Pennsylvania, in the chair.) The gentleman from Michigan declines to be interrupted.

Mr. HERR. My friend from Ohio claimed that his district includes a surplus of 5,000—

Mr. ATHERTON. No; 50,000.

Mr. HERR. Not 50,000 more than the regular ratio?

Mr. ATHERTON. No; 50,000 more than the adjoining district.

Mr. HERR. But here we have a district with nearly 40,000 people in excess of the regular ratio of the State and 69,000 more than the adjoining district, and built in that way simply to gather within its crooked and indented borders as many of the colored voters as possible—

Mr. EVINS. The gentleman from Michigan certainly does not wish to misrepresent the facts. [Cries of "Order!" "Order!"]

The SPEAKER *pro tempore*. The gentleman from Michigan declines to be interrupted.

Mr. EVINS. The gentlemen upon that side of the House have not been interrupted in this discussion, and I simply want to say to the gentleman from Michigan that we proposed on this side of the House to pass a bill, as he will remember, to prevent just what he now complains of, that is gerrymandering, and gentlemen on that side of the House voted solidly against it. We proposed on this side of the House to pass a measure to put a stop to what he now complains of.

Mr. DUNN. Yes, as an amendment to the apportionment bill.

Mr. HERR. Why, gentlemen, the bill that we passed if properly executed—

The SPEAKER *pro tempore*. The time of the gentleman from Michigan has expired.

Mr. HERR. But, Mr. Speaker, a large part of my time has been consumed by the interruptions of other gentlemen.

Mr. ATHERTON. Give him five minutes longer.

Mr. HERR. I would like about ten minutes more—

Mr. ATHERTON. Well, I have no objection. When a gentleman is coming to the point of his argument and wants a little time I think he ought to have it.

The SPEAKER *pro tempore*. Without objection, the gentleman from Michigan will proceed ten minutes.

Mr. MOULTON. The time, of course, must be taken out of the other side.

Mr. HERR. Mr. Speaker, I was about saying to the members of this House that the apportionment bill which passed the House at this session requires districts to be made from contiguous territory and as nearly as practicable equal in population. And let me say that any set of men who would try to faithfully and honestly execute that law as passed could never make such districts as those we are now considering.

Mr. EVINS. Will the gentleman now permit me to interrupt him?

Mr. HERR. I have heretofore yielded to the gentleman, but I cannot now spare the few moments given me by the courtesy of the House.

Mr. EVINS. The gentleman is speaking by unanimous consent, and I think I have the right to interrupt him or object to his proceeding.

Mr. HERR. No, Mr. Speaker, what I complain of in this case is not what is commonly called gerrymandering; it is what seems to me to be villainy, downright villainy.

Mr. EVINS. Of course the gentleman from Michigan has the right to use the term "villainy" toward that people and refuse to be interrupted, but I object to the gentleman speaking unless he will consent to be corrected when he makes statements of that kind.

Mr. HERR. The gentleman from South Carolina knows very well that my time, though given by unanimous consent, is limited. And, Mr. Speaker, let me say to my friend one thing. It is this: that just so long as you people of the South attempt to destroy the freedom of the ballot by that kind of chicanery, just so long as you strive by such means as that to prevent the honest expression of the honest voters of your States, just so long you will be compelled to stand here and defend yourselves, and just so long you will create in the North that feeling of just indignation which will keep it solid in the future against such practices, because our people will never consent to have this Government pass into the hands of men who will either perpetrate such wrongs or who will defend those who have perpetrated them. [Applause on the Republican side.]

Mr. ATHERTON. And just so long as you do as you have done—

Mr. HERR. I do not yield.

Mr. ATHERTON. The gentleman will permit me to say that "villainy" in the South is "villainy" in Ohio. [Cries of "Order!" "Order!"]

Mr. HERR. I hope my friend from Ohio will be patient. I have here a little tissue ballot which I desire to show to the House. It was used, I am told, in the Lee and Richardson district. It is headed "Union Republican Ticket." Then follows: For President, James A. Garfield; for Vice-President, General Chester A. Arthur.

Now, what is peculiar about this ticket, in addition to its size and the delicate tissue paper on which it is printed, is this: there is not a single man named on it who was running for any office except Mr. Richardson, the Democratic candidate for Congress, and of course excepting the President and Vice-President, who could not be voted for in that way. Still I am told that 465 of these ballots found their way into the ballot-boxes in one county. What could have been the object of this? Of course, precisely the same object aimed at by this outrageous districting scheme; both are done to prevent the honest voters of South Carolina from having a fair expression of their voice

in the election of their members to Congress. I give here the entire ticket:

UNION REPUBLICAN TICKET.

For President,
Gen. James A. Garfield.
For Vice-President,
Gen. Chester A. Arthur.
Electors at Large,
J. A. F. Coleman,
Miles Wallace.
District Electors,
1st—J. W. Bouknight.
2d—J. E. Gilbert.
3d—W. H. Thewel.
4th—J. W. Rector.
5th—A. S. Smith.
Congress—First District,
John S. Richardson,
Senator,
R. M. Harriot,
Representatives,
Pompey Kinloch,
E. H. Coit,
Sheriff,
T. E. Rhodes,
School Commissioner,
Albert Sinclair,
County Commissioners,
R. O. Bush,
Robert Nowlan,
Moses Langley,
Probate Judge,
J. Z. McConnell,
Coroner,
L. B. Lloyd.

Let me repeat again to you gentlemen that the North will be kept solid just so long as you insist upon these methods of destroying the votes of the loyal people of the South, just so long as you continue to practice that kind of trickery. But you ask what has all this to do with the case before the House? Let me tell you. These cases show that you men of the South are simply carrying out a plan which you inaugurated among yourselves immediately after the reconstruction acts were passed. The moment we had forgiven you for the part you took in the rebellion and had given you even the right to sit here as law-makers of the land, you commenced at once—and South Carolina was conspicuous among those who started this plan—I say you commenced by every conceivable means, by kukluxism, tissue ballots, intimidation, red-shirt brigades, and shot-gun companies—

Mr. EVINS. I rise to a point of order.

Mr. HERR. I say you tried by all these means to prevent the voice of her loyal people from being heard and to prevent the colored men in your States from having any voice in choosing their rulers. Now, I say, and I say it in all kindness to my friend, [advancing toward Mr. ATHERTON,] that such a thing could not be done in Ohio, and you know it.

Mr. ATHERTON. Let me ask you one question—

Mr. ROBINSON, of New York. I rise to a point of order. This has become a personal controversy and is disgraceful to the House.

Mr. ATHERTON. I understand that is denied, and I ask you where it was done?

Mr. HERR. I have here the list of the various precincts in which those tissue ballots were used, in one county giving the number of such ballots found in each box. And as to this redistricting business I say here and now, without fear of successful contradiction, that you may take the districting of any Northern State, I care not what State you select, and hang the map of it up here, and you cannot duplicate this bare-faced performance anywhere in this entire country.

Mr. BERRY. I would like to ask the gentleman—

Mr. HERR. Do you think you could do it in California?

Mr. BERRY. No, sir; but I want to know if tissue ballots are any worse than these tape-worm tickets [showing them] used by the Republicans in my State?

Mr. HERR. If the Republican party used that kind of tickets in the State of California they were in bad business. And let me ask you right here, have you no higher idea of politics than to imitate the worst things the Republicans may have done? [Laughter and applause.] The great trouble with your Democratic party seems to be that you have come to feel that you are on very high moral ground if you can succeed in climbing up to some place where we Republicans have made a mistake. If you do any wrong thing and you can find some time in the past where we committed the same folly, you act as if your vindication was complete. Let me beg of you to cease following our errors and hereafter imitate some of our many virtues. [Applause.]

Mr. ROBINSON, of New York. Will my excitable friend allow me to ask—

Mr. HERR. No, sir; I cannot yield to the gentleman now. I say if you Democrats would imitate our well-doings you would make better men of yourselves. If our party at any time used those tape-worm ballots on the Pacific Slope, in doing so they did wrong.

Mr. BERRY. They did, and they practiced that on the poor workmen.

DIAGRAM NO. 6.

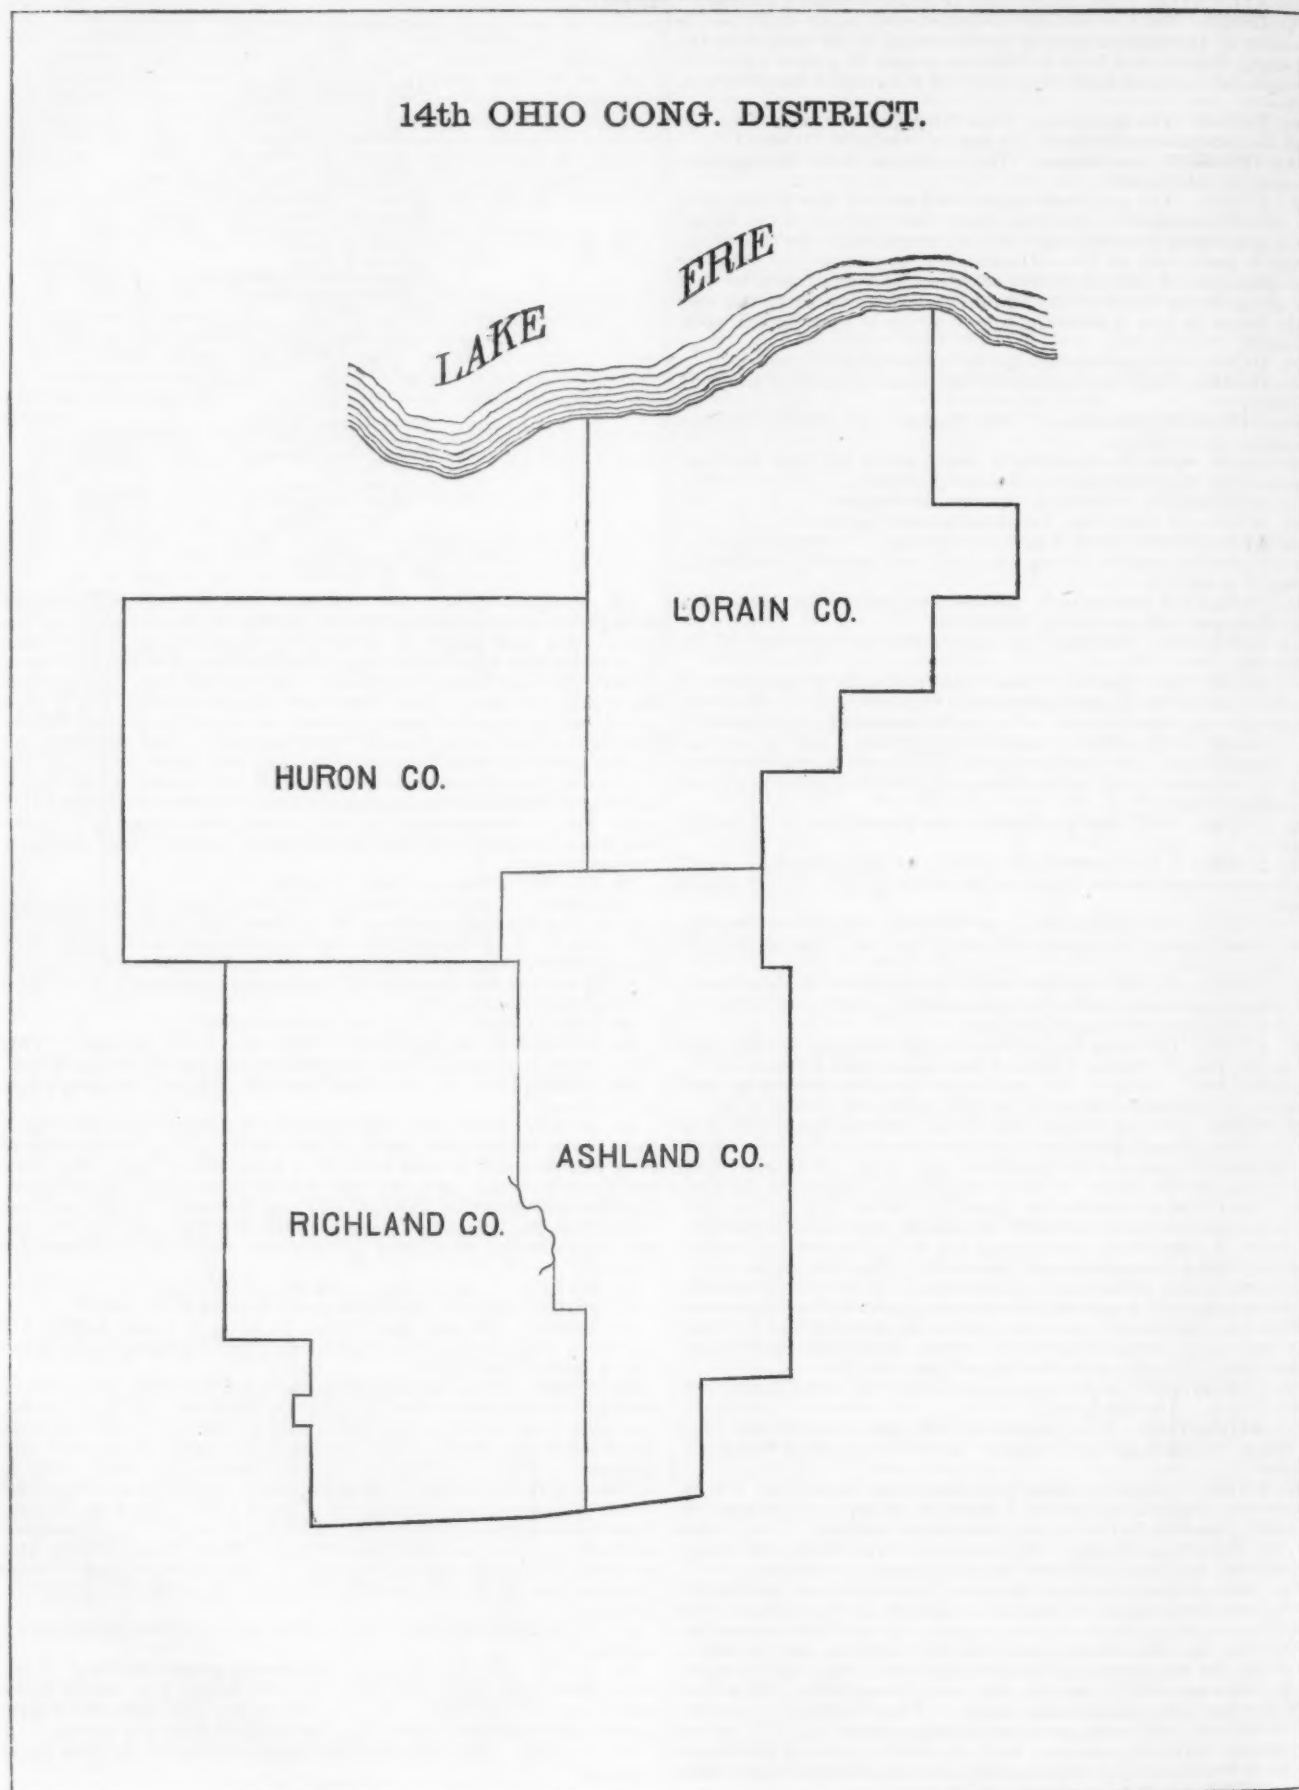

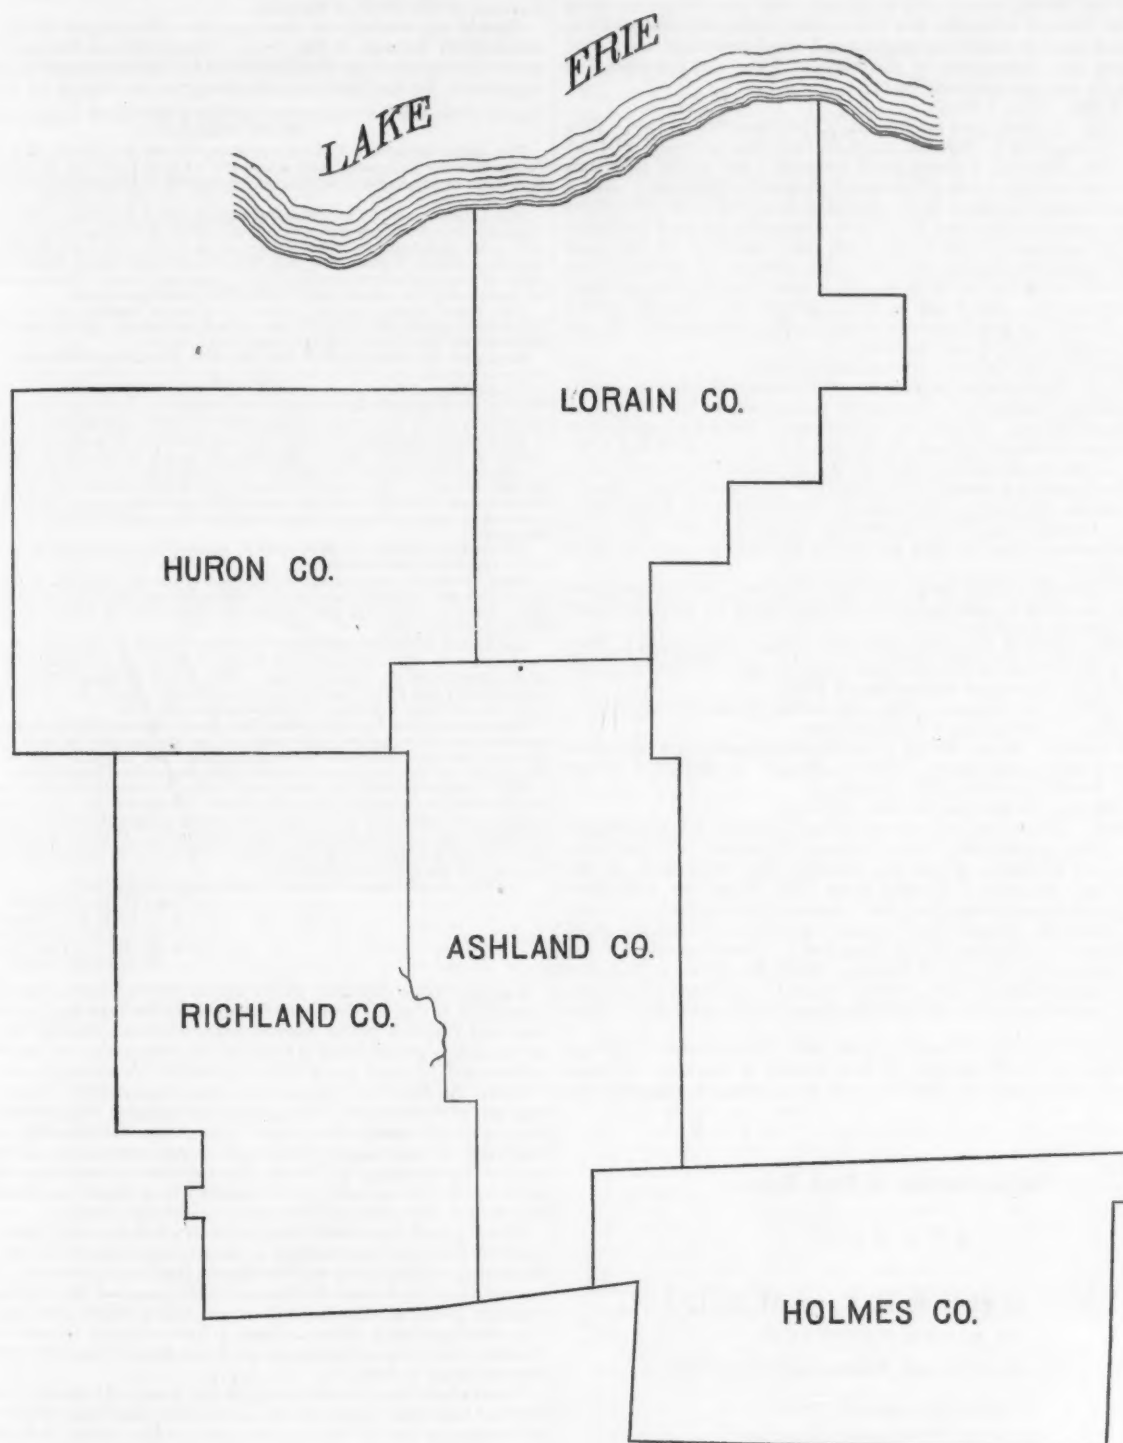

DIAGRAM NO. 7.

14th OHIO CONG. DISTRICT.

WITH HOLMES CO. ATTACHED.

Mr. HERR. I know nothing of the facts, but my friend will never find me excusing such practices any where, by any party.

Mr. ATHERTON. Would it not be better for the missionaries of your party to carry the red flannel skirts into Ohio rather than into Africa or South Carolina?

Mr. HERR. I had hoped that the missionary work of our party was well-nigh completed, but since listening to the iniquities of these election cases and since examining the redistricting of Mississippi and South Carolina I am satisfied that the work of the genuine missionary in this country is just begun. [Applause.] And in my campaign work the coming fall I propose to hold up before the people of the North these very diagrams, that very map, to show them what kind of rascality the Democratic party stands ready to indorse, and also to let them understand what practices they may expect from the Democrats of the South. [Mr. ATKINS rose.] I know you do not indorse such work.

Mr. ATKINS. No; I do not.

Mr. HERR. I knew you would not. You have too square a face for that. [Laughter.] But to return to the case on trial. For the contestee, Mr. Tillman, I have great respect. My social relations with him have always been of the most pleasant character. But I say to him frankly he comes here weighted down with the iniquities of an entire community, and he will in a measure be held responsible for their past sins. Such has been their conduct in the past toward the freedmen in that district that charges of intimidation and fraud will be believed of those people more readily than of some other communities. And I ask in all candor if such should not be the case. Is not the gentleman to some extent responsible for the state of things that exists about him?

Mr. ATHERTON. Is he to be responsible for—

Mr. HERR. He is to be held responsible somewhat for the political opinions and actions of the people among whom he lives as an acknowledged leader. Where the members of his own Legislature can perpetrate such an outrage as the one I have pointed out here, it naturally throws suspicion upon all the political actions of such a State, and whenever a man will indorse such a scheme and then in the next breath take such a high moral stand as did my friend from Ohio, [Mr. ATHERTON,] there is another suspicion that naturally follows, and that is that he does not really believe one word that he says. [Applause.]

Mr. ATHERTON. That may be very well, but I want to suggest that among lawyers a man is not to be convicted in 1880 for what somebody may do in 1882.

Mr. HERR. That is very true, but still what a man does in 1882 may show a confirmed habit and thus throw some light on the probabilities of what he might have done in 1880.

The SPEAKER *pro tempore*. The gentleman's time has expired.

Mr. HERR. I would like a moment more.

Mr. MOULTON. If my friend from Michigan asks for a minute I will give it to him with great pleasure, though he objected to my friend from South Carolina, [Mr. EVINS.]

Mr. THOMAS. It was not he who objected.

Mr. HERR. I want only a moment simply to show the gentleman from Ohio, [Mr. ATHERTON,] who took me unawares as to the fourteenth district of Ohio, which my brother may represent in the next Congress. My friend DAWES from that State has furnished me a diagram here showing the exact shape of the district as it now is. Just look at it. Simply four entire counties in one square, solid chunk. There. [Pointing to the diagram.] [See diagram No. 6.]

Now, to put on the county of Holmes, which my friend ATHERTON claims naturally belongs there, would make the picture like that. [See map of fourteenth district with Holmes County attached. Diagram No. 7.]

He must have become so familiar with Democratic districting that a district does not look natural to him unless it has one of those prongs on it. [Laughter.] As it now is it is a square, shapely district.

Coaling-Station at Port Royal.

SPEECH

OF

HON. ROBERT SMALLS,

OF SOUTH CAROLINA,

IN THE HOUSE OF REPRESENTATIVES,

Saturday, August 5, 1882,

On the sundry civil appropriation bill.

Mr. SMALLS said:

Mr. SPEAKER: I desire to say but a few words in advocacy of Senate amendment No. 145, which the committee of conference recommend. It is as follows:

For establishing and completing a coaling-dock and naval storehouse at Port Royal Harbor, South Carolina, \$30,000, the site for said coaling-dock and naval storehouse to be located by a board of naval officers appointed by the Secretary of the Navy for that purpose.

I would have preferred the original amount of \$30,000 with which the Senate amended the bill. But the House refused to concur yesterday in that amendment. The committee now recommend twenty thousand.

I am willing to accept that amount, and do earnestly hope that the House will reconsider its action of yesterday whereby it refused to concur in the Senate amendment granting \$30,000 for this purpose, and will now concur in the committee's report and grant the twenty thousand recommended.

Port Royal Harbor is one of the best, if not the best, harbor on the Atlantic coast south of Hampton Roads, and I might include the harbors of the Gulf of Mexico.

Should my remarks on the superior advantages of this harbor be discounted because it lies in my Congressional district, I will here quote the report of the distinguished and disinterested board of officers appointed by the Forty-fourth Congress to report on this subject:

Report of the board of officers convened by authority of Congress for the examination of navy-yards.

The board embarked at Washington on the 22d November, 1876, in the United States steamer Tallapoosa, and proceeded south to ascertain by personal observation what positions could be selected for a naval station on the coast of South Carolina or Georgia.

The Tallapoosa stopped first at Port Royal, South Carolina. This harbor is well known to naval officers, and its value as a naval station has been appreciated since 1861, when it was first occupied by our naval forces, and it was found to be the only harbor between Norfolk and Key West that would afford shelter to our largest ships of war, and where a naval station possessing most of the requirements could be established for refitting and replenishing our squadrons.

Port Royal is very easy of access; its channel leading into the harbor or bay offers sufficient depth of water for our largest vessels, and the bay and its tributaries could afford anchorage for the largest navy.

Soon after the occupation of Port Royal by Rear-Admiral Dupont its importance was recognized, and depots for coal and provisions and temporary machine-shops were established for the use of our naval forces, and Port Royal was continued as a naval station until 1865, when it was broken up, our small Navy not requiring more navy-yards than those recommended by the board to be kept in commission.

Without doubt there are some excellent locations for a naval station to be found either in Port Royal Bay or Beaufort River, on Broad River, or on Colleton or Checheesee Rivers, but the limited time of the board did not permit them to make minute surveys. They availed themselves of information furnished by the naval officers stationed at Port Royal, secured the services of the best local pilots, and proceeded in the steamer up the several tributaries as far as their judgment deemed necessary.

In selecting a site for a navy-yard or station there are many important matters to be taken into consideration:

First. A minute and correct hydrographical survey should be made, for although the charts are no doubt correct and serve perfectly well for navigating the streams and rivers, yet they are not sufficiently minute in all cases for the purpose of locating a navy-yard.

The harbor of Port Royal, South Carolina, and its tributaries, present great advantages, and offer the necessary depth of water and facilities for entering the port without risk to vessels of war. Port Royal Bay is a noble sheet of water, undoubtedly the finest harbor on our southern coast. The wonder is that the place was so little known or appreciated prior to 1861.

There are several favorable sites for a naval station at Port Royal, all of which must be carefully studied and compared before the best one can be determined. In the mean time the board recommend that Port Royal be used as a temporary fitting and coaling station for vessels stationed in the West Indies.

This could be established at no great outlay, by keeping here a few old ships, on board which temporary machinery could be erected for the repair of vessels, engines, and boilers—a store-ship is at present stationed there—a depot for coal on shore or in hulks, and a hospital and ordnance ship, all of which could be removed at a moment's notice, if the Government did not deem it expedient to continue to occupy this place as a naval station.

We have the honor to remain, very respectfully, yours,

DAVID D. PORTER, Admiral.
S. C. ROWAN, Vice-Admiral.
C. H. DAVIS, Rear-Admiral.
J. W. KING, Chief Engineer.
J. W. EASBY, Naval Constructor.

I might appropriately add what is now of historical importance, that Port Royal Harbor was selected by the late distinguished Rear-Admiral Dupont as the base of his operations during the early part of the late war and that it was the headquarters for important operations both by land and sea during the entire continuance of the war.

Since the war Port Royal has been practically a "coaling-station and naval storehouse," though not designated such formally by law. One or more vessels have been lying there continually, so that the building of this coaling-dock and naval storehouse on land owned by the Government will be really a matter of economy and will dispense with the necessity of vessels lying there continually in the stream for this purpose, subject to constant decay.

The Pawnee has been lying in the harbor for more than a year, and is there still, and is reported to be greatly injured by worms. The Wyoming is also lying in Port Royal Harbor at present. The building of this dock and storehouse will prevent the necessity of the Pawnee lying in the harbor or any other vessel for that purpose. The distinguished officers whom I have already quoted say "it is a wonder that the advantages of Port Royal Harbor were so little known prior to 1861."

I will state that its advantages are now well known. Port Royal Harbor has more water on its bar at low tide than either Charleston or Savannah has at the highest spring tide. And it is yet destined to be the great port of outlet for the immense grain products of the West on their way to Europe.

It is a harbor, moreover, that the Government will not be annually called upon to make large appropriations to keep in a condition to allow large ships to enter, as it is required to do both at Charleston and Savannah. It is a harbor furnished by nature for the largest ships in the world, and can easily contain the entire Navy of the United States.

I speak from personal knowledge and experience, Mr. Speaker, for it was my good fortune during the late war to be engaged as a pilot in the Navy in this harbor and afterward as a captain in the Quartermaster's Department.

Port Royal Harbor, with its twenty-one feet of water on her bar at low tide and twenty-eight feet at high tide, is destined to rise to the position which her great natural advantages entitle her at an early day, although she lies between the two old and well-established sea-ports of Charleston and Savannah; her railroad to Augusta and thence to the great West will give her the facilities which she needs, and she will yet eclipse all the South Atlantic ports.

Naval Appropriations.

SPEECH

OF

HON. BENJAMIN W. HARRIS.

OF MASSACHUSETTS.

IN THE HOUSE OF REPRESENTATIVES.

June 28 and 29, 1882.

The House, in Committee of the Whole on the state of the Union, having under consideration the bill (H. R. No. 6616) making appropriations for the naval service for the fiscal year ending June 30, 1883, and for other purposes—

Mr. HARRIS, of Massachusetts, said:

Mr. CHAIRMAN: The Committee on Naval Affairs have during the session spent weeks in carefully investigating into the present condition of the Navy and its wants. The result of their labors is the bill No. 5001, entitled "A bill authorizing the construction of vessels of war for the Navy of the United States, and for other purposes." That bill lies buried upon the Calendar of the whole House on the State of the Union. A report, No. 653, to which is appended a mass of valuable testimony taken by the committee, accompanies the bill. We had hoped and expected to have secured for that bill a hearing upon its merits. We had little doubt that it would secure the approval of the House and be promptly passed. But our expectations have been disappointed. The rules of practice in the House are such that a majority of less than two-thirds is as helpless to execute its will as even the feeblest minority.

The measure which had been matured with so much labor, care, and industry by the committee, which the people of this country would approve, which the best interest of the Navy demands, and which this House has shown its readiness and desire to consider and act upon, under our rules is utterly out of our reach. The only privilege which the Committee on Naval Affairs, or myself, as its chairman, are by the rules permitted to enjoy and exercise is the privilege granted as a matter of grace and favor freely and generously, I take pleasure in saying, by the Committee on Appropriations, of participating for an hour in the general debate on the naval appropriation bill, into which that committee has seen fit to put a few fragments of the legislation proposed by the Committee on Naval Affairs and contained in the bill before referred to. You can hardly imagine the humiliation which, as chairman of the Committee on Naval Affairs, I feel in participating in the debate on the bill before us. I am justified, I think, in saying that we deserve more than this, and that the important question as to what is the duty of this House toward the Navy of the country demands more than this.

OBSTRUCTIVE RULES.

But so it is. By our rules two or three of the leading committees which are always entitled to the floor with their business have the power to dictate to all other committees what they shall say, what they shall do, and when and how they shall say it or do it. By the kind grace and favor of the Committee on Appropriations I am permitted to advocate on a bill prepared by that committee measures wholly matured and as I think much better set forth in a bill prepared by the Committee on Naval Affairs, and in the authorship of which I may not improperly claim a large share. I do not complain of the Committee on Appropriations. They have undertaken to help us a little, and to give us a day in court otherwise denied to us.

Mr. HISCOCK. I desire to say to the gentleman, if he will allow me—

Mr. HARRIS, of Massachusetts. Certainly.

Mr. HISCOCK. That it has been the intention of the Committee on Appropriations to work in entire sympathy and harmony with the Committee on Naval Affairs, and especially with the honorable chairman of that committee.

Mr. HARRIS, of Massachusetts. I cheerfully acknowledge the correctness of the statement made by the honorable chairman of the Committee on Appropriations.

Mr. HISCOCK. And many of the provisions of this bill have been inserted by our committee because the rules of the House denied to the committee of which the gentleman is chairman a hear-

ing before the House. We have done what we could to facilitate his having a day in court.

Mr. HARRIS, of Massachusetts. And I want in the amplest manner to render thanks to that committee for having done so. I am complaining of the rules of the House and not of the honorable chairman or of his committee.

I venture to hope that no other House which may assemble here will tamely adopt for its guidance this body of rules as a whole, and thus put itself in bondage at the moment of assuming the duties and powers of legislation as did this House. I pray Heaven that the Congress hereafter to be convened may be wise enough to so far preserve its freedom and escape the despotism of parliamentary rules as to be able to practice in legislation the great distinguishing doctrine of our American Republic, that the will of the majority shall govern.

RECONSTRUCTION OF THE NAVY NOT A POLITICAL MEASURE.

Mr. Chairman, when the bill and report from the Committee on Naval Affairs to which I have referred were presented and referred to the Calendar of the Whole House on the state of the Union—that tomb in which lies so much of honest, intelligent, and useful proposed legislation, but from which, however, there is so little hope or promise of resurrection—the work had the indorsement and approval of the best friends of the country. The best portion of the public press spoke of it with approval. When an attempt was made to assign a day for the consideration of the measure, 145 members voted in the affirmative and only 91 in the negative. It failed of a hearing because by a rule we have agreed that in such matters a minority of one-third and one more shall govern.

Since that time the enemies of the measure, in this House and through the columns of some of the newspapers, have tried to bring political considerations to bear against it. Prejudice against members of the committee have been attempted to be engendered and excited to its injury. It has been proclaimed on this floor that the present able Secretary of the Navy should not be permitted to expend money for the building up of a navy, not, as I understand, because he is either incompetent or dishonest, but because he is a Republican, and too able a Republican to inspire confidence in Democratic circles. I desire to say that in the Committee on Naval Affairs no such spirit prevailed. Political considerations were shut out entirely. Personal prejudice had no place there. Our bill and report represent the views of the entire committee with no dissenting voice or vote. The committee was a unit.

Now, Mr. Chairman, while thanking the Committee on Appropriations for having accepted and incorporated in the bill before us a part of the measures proposed by the Committee on Naval Affairs, I can but regret that they have not accepted and adopted more of it. I wish they could have seen their way clear to adopt the whole bill No. 5001, appropriating \$10,000,000 for the building of the pioneer ships of a new navy. I am confident that it would have reflected no discredit on the committee, and if adopted it would have brought honor to Congress and the country.

Mr. HISCOCK. We would have done it, but it would have been liable to a point of order perhaps.

Mr. HARRIS, of Massachusetts. I understand the reason, but if a point of order would lie against an appropriation of \$10,000,000 for new vessels, why not against the bill of the committee which appropriates a smaller sum for the same purpose. Yes, it is the rules which stand in our way when we wish to do anything of great importance to the country. Fear of the rules and of the general objectors who use the rules to defeat legislation often makes cowards of us and deters us from attempting what we ought to do and may properly do.

If under the rules it is unlawful to appropriate \$10,000,000 for new ships, it is equally unlawful to appropriate \$500,000 for that purpose. It is not a question of degree. Grant the power to appropriate one dollar, and we may appropriate any sum which we may think best.

THE NAVY IN CONGRESS.

Mr. Chairman, during the last fifteen years Congress has been at fault and has not done its duty toward the Navy. Gentlemen rise upon this floor and complain of the conduct of the former administrations of the Navy Department. They denounce in bitter and in almost vindictive terms acts of a former Secretary. My friend from Tennessee, [Mr. WHITTHORNE,] the late chairman of the Committee on Naval Affairs, has had the opportunity at last (and I congratulate him upon it) to deliver a speech which was due in its order in the Forty-fourth Congress. I have for a long time desired to hear that speech, and that desire has now been gratified. Had it been delivered in the Congress to which it belonged, I might have then felt it to be my duty to make some reply to it, and to have pointed out some of its error and injustice.

But in that and the succeeding Congress, during which the gentleman as chairman of the Naval Committee conducted his great inquisitorial investigation into the administration of naval affairs, I had an opportunity to reply generally by report to so much of the findings and conclusions and charges of the gentleman and his associates of the majority as I deemed deserving of notice. That matter has long since passed by. My duty has been fully and honestly discharged. The record is made up so far as I am concerned, and I have no desire to change it. Whatever charges he now revives and brings here must be answered, if answered at all, by some person other than myself.

The gentleman at whom the speech of the gentleman of Tennessee was aimed is now here a member on this floor, and he can answer for himself if he thinks he is called upon to reply at all.

DEPARTMENTAL AND PRESIDENTIAL RECOMMENDATIONS.

I said, sir, that Congress has been neglectful of its duties to the Navy. Congress has had from the close of the war, in 1865, repeated and annual warning that the Navy was falling into rapid decay. I have only to turn to the annual reports of the Secretary of the Navy and messages of the President to establish the fact.

In his annual report of December 1, 1869, the Secretary of the Navy said:

It is not doubted that any war with a foreign enemy must be a maritime one. The American people are accustomed to success on the ocean; and they would have little cause, and less inclination, to forgive a policy which, at the first sign of a foreign war, sent our Navy hurrying ignominiously to our shores.

Yet we have not at this time, on any foreign station, a squadron whose combined force would avail for a day against the powerful sea-going iron-clads which both France and England have on the same stations.

These are not agreeable facts to contemplate, or to state, but after giving the subject much investigation and reflection, I have felt it to be my duty to state the truth frankly, through you, to the representatives of the people, that they may determine how much and how prompt action the situation requires.

In his annual report of December 1, 1870, he called the attention of Congress to the subject in this language:

I have not repeated at length many of the important suggestions and recommendations for the improvement of the Navy which I felt it my duty to make last year; but those recommendations still remain, and I beg to refer to and again press them, as suggestive of much that is needed not only for the efficiency of the naval service, and for the honor, safety, and welfare of the country.

Should Congress at any time think fit to adopt any measures looking to permanent improvement in the number and character of our naval force, the Department will be ready to furnish the proper information and estimates.

In this connection I will repeat, what I have had occasion before to remark, that neither ships, dock-yards, nor ordnance can be legislated into existence at the moment when needed, but are the products of long-continued industry and skill. A ship of war, armed, equipped, manned, and officered for efficient service, cannot be extemporized, but is the combined result of much labor, skill, science, training, discipline, and experience, produced by slow processes and organized with great care.

Merchant vessels, whether of wood or iron, though of great value as an auxiliary force of privateers, dispatch boats, and cruisers, could not in time of war be relied on as a main body of the Navy. Not built to carry heavy batteries, nor to resist the effect of heavy shot or shell, they could not encounter the war ships of any enemy.

In his report of 1872 he says:

This subject has been constantly pressed upon the attention of Congress, and I again repeat it, because I am constantly warned, as ship after ship is withdrawn from active service and laid up without hope of usefulness in the future, that the limit of our old resources is being rapidly reached, and that without new material our active force on the several stations must rapidly decrease, until our cruising navy will in a few years pass almost entirely away.

President Grant, in his annual message of that year, used the following language:

NAVY DEPARTMENT.

The report of the Secretary of the Navy herewith accompanying explains fully the condition of that branch of the public service, its wants and deficiencies, expenses incurred during the past year, and appropriations for the same. It also gives a complete history of the services of the Navy for the past year, in addition to its regular service.

It is evident that unless early steps are taken to preserve our Navy that in a very few years the United States will be the weakest nation upon the ocean of all great powers. With an energetic, progressive business people like ours, penetrating and forming business relations with every part of the known world, a navy strong enough to command the respect of our flag abroad is necessary for the full protection of their rights.

I recommend careful consideration by Congress of the recommendations made by the Secretary of the Navy.

The admonitions to Congress above quoted have been repeated in various forms almost annually from 1865 to the present year. And now we have addressed to us, in the message of the President, the following earnest appeal in behalf of the Navy:

I cannot too strongly urge upon you my conviction that every consideration of national safety, economy, and honor imperatively demands a thorough rehabilitation of our Navy.

With a full appreciation of the fact that compliance with the suggestions of the head of that Department and of the advisory board must involve a large expenditure of the public moneys, I earnestly recommend such appropriations as will accomplish an end which seems to me so desirable.

Nothing can be more inconsistent with true public economy than withholding the means necessary to accomplish the objects intrusted by the Constitution to the national Legislature. One of those objects, and one which is of paramount importance, is declared by our fundamental law to be the provision of the "common defense." Surely nothing is more essential to the defense of the United States and of all our people than the efficiency of our Navy.

We have for many years maintained with foreign governments the relations of honorable peace, and that such relations may be permanent is desired by every patriotic citizen of the Republic.

But if we heed the teachings of history we shall not forget that in the life of every nation emergencies may arise when a resort to arms can alone save it from dishonor.

And the Secretary of the Navy commences his annual report with this earnest appeal in behalf of the Navy:

The condition of the Navy imperatively demands the prompt and earnest attention of Congress. Unless some action be had in its behalf it must soon dwindle into insignificance. From such a state it would be difficult to revive it into efficiency without dangerous delay and enormous expense. Emergencies may at any moment arise which would render its aid indispensable to the protection of the lives and property of our citizens abroad and at home, and even to our existence as a nation.

We have been unable to make such an appropriate display of our naval power abroad as will cause us to be respected. The exhibition of our weakness in this important arm of defense is calculated to detract from our occupying in the eyes of foreign nations that rank to which we know ourselves to be justly entitled. It

is a source of mortification to our officers and fellow-countrymen generally that our vessels of war should stand in such mean contrast alongside of those of other and inferior powers.

The mercantile interests of our country have extended themselves over all quarters of the globe. Our citizens engaged in commerce with foreign nations look to the Navy for the supervisory protection of their persons and property. Calls are made upon the Department to send vessels into different parts of the world in order to prevent threatened aggression upon the rights of American citizens, and to shield them in time of civil commotion in foreign lands from insult or personal indignity. It is to be deplored that in many such instances it has proved impossible to respond to these calls from the want of a sufficient number of vessels.

These things ought not to be. While the Navy should not be large, it should at all times afford a nucleus for its enlargement upon an emergency. Its power of prompt and extended expansion should be established. It should be sufficiently powerful "to assure the navigator that in whatsoever sea he shall sail his ship be is protected by the Stars and Stripes of his country."

CONGRESSIONAL COMMITTEES' REPORTS.

The warning has been heard, if not by Congress, by the Committees on Naval Affairs, and they have faithfully reported to this House during the last two Congresses at least. The committee of the Forty-fifth Congress, in a report on the subject, used the following language:

In comparison with the leading naval powers of the world, we occupy a very humiliating and unsatisfactory condition; but we had better know and appreciate it now, and, if possible, provide the remedy, than be startled by the revelation at a period of impending danger.

It is for Congress to say, with the evidence before it, what measures shall be taken to place the country in a condition for defense, and to provide the means for carrying the flag of the country in honor and safety upon the sea. The people of the United States will not long consent to this present condition of weakness and possible danger.

The Committee on Naval Affairs of the House in the Forty-sixth Congress were no less unanimous. In a report on the condition of the Navy, after showing in detail the real condition of every ship and every gun in the Navy, they say:

At the opening of the late war the ships and the guns of the American Navy were equal to those of any nation. When the Monitor and the Merrimac met and startled the world with their conflict in which thick armor became for the first time an over-match for heavy guns, the other nations commenced to solve great problems in naval warfare. While they have been spending vast sums of money and making experiments in all directions, we have rested and waited, until now the power of guns has outrun the resisting power of armor. In comparison with the navies of Great Britain, France, Italy, and even Spain, the American Navy is immensely inferior in ships and armament. And yet these nations have in the construction of these navies but followed out and improved upon American examples and models.

In view of these facts, the committee believe it to be our duty to begin at once to prepare for the work of building up a navy adequate to the national defense and to the preservation of the national honor. We cannot expect at once to build up a navy powerful enough to meet in mid-ocean and successfully contend with the monster iron-clads of England, France, and Italy, nor do we desire that the attempt should be made. We have no colonial dependencies to hold in unwilling subjection, nor jealous rival nation upon our borders to overawe by any exhibition of power. We have no temptation to make aggressive war for conquest upon any transoceanic nation. We have an empire equal to our ambition, not too large, let us hope, to be successfully governed as one nation upon republican principles.

We have a navy capable of protecting our commerce in all seas, of defending our own borders from invasion, and of destroying the commerce and sea-going cruisers of any nation which may make war on us.

To do the first, we should put our iron-clad fleet in condition of the greatest efficiency; we should also develop the torpedo system to its fullest extent. This arm of defense American in origin, and has performed its greatest service on this side of the Atlantic. It deserves the greatest care. It may be improved and carried to a state of perfection not now conceived of, if we will invite and encourage our inventors to give the subject their best efforts. With our iron-clad fleet in condition for coast and harbor defense, and our torpedo system perfected, 45,000,000 of Americans may defy all danger of foreign invasion.

In this connection it may be well to remark that the great iron-clads of Europe, of which so much is said and written, are few of them dangerous to us. They are too heavy and too unwieldy to venture 3,000 miles across the ocean, and of too great draught to navigate the shallow waters of the Atlantic sea-coast. Upon the ocean they can do no harm, for they would find no antagonist anxious to engage them, and their speed would not enable them to overtake steam sea-going cruisers worthy of the name.

But we should be able not only to meet and beat off an invader at our shore but also to exert from an enemy terms of honorable peace, by aggressive war upon the high seas. In case of war with a great commercial nation like Great Britain the hardest blow we could strike at her would be upon her commercial ships. With her commerce unharmed, England would be England still, even if every ship of war of her vast navy was sunk at the bottom of the sea. We should possess and be able rapidly to put afloat in case of war a few ships of not more than 2,000 tons burden, armed with rifled guns of great power and range, and so swift as to be entitled to be called "the cavalry of the sea."

The late war of the rebellion taught us how much harm a few fast ships, gallantly commanded, cruising at will in all seas, can do. The lesson should not be lost upon us as a nation, and, in the opinion of this committee, the time has arrived when it is a national duty to begin the construction of a new navy on this plan and with the policy here laid down. Our cruisers should not all be so large as 2,000 tons, and some may well be larger, but they should be armed with guns of the longest range and greatest power, and should possess a speed sufficient to enable them to choose time and occasion and fight or flee at will and administer just retribution upon an enemy by the destruction or capture of his commerce.

In any future wars with European nations we must fight upon the sea or nowhere; they will never meet us upon the land on this side of the water; and we shall never invade their shores. England, as we have said, is vulnerable only in her commerce. Upon her own territory she is well-nigh invincible, and we hope she may ever remain so, cripple or destroy her commerce and you punish England.

With this adopted as the future policy of the country in naval affairs, we should commence the work at once. But we do not recommend the expenditure of large sums with a view to perfecting such a navy this year or next. We would lay down our plan, begin the work carefully and evenly, and commence the construction of three or four such vessels each year, and keep constantly employed a regular force of skilled mechanics no larger than can be kept steadily and regularly at work.

The Committee on Naval Affairs of this House have again brought to the attention of Congress and the country the condition of our Navy. As an appendix to my remarks I shall make extensive extracts from that report.

ACTION BY CONGRESS.

But, sir, what has Congress done in all this time? If nothing had been done except that which Congress had expressly authorized, we should have had almost no Navy at all.

The only express authority given by Congress for building new vessels of war is found in the act of February 10, 1873, "authorizing the construction of eight steam-vessels of war." The total appropriation for these vessels was \$3,200,000, and the total tonnage authorized was 8,000 tons. This would have given, if the ships authorized had been all of one class, eight small vessels of 1,000 tons each. But the Department expended this appropriation in building vessels of three sizes, namely:

Vessels.	Displacement.	Tonnage.
Trenton	3,900	2,300
Adams	1,375	615
Alliance	1,375	615
Essex	1,375	615
Enterprise	1,375	615
Alert	1,020	541
Huron	1,020	541
Ranger	1,020	541
Total	12,400	6,383

It will be seen that all of these vessels except the Trenton are small, indeed the smallest cruising vessels whose names appear on the Register. Their total tonnage is only 6,383. They were built substantially within the appropriation. If the appropriation had been larger I presume more of the Trenton class would have been built. These vessels are known as the "eight sloops" authorized by the act of 1873.

The Trenton is the finest and most useful vessel in our Navy, and the largest vessel in service with the exception of the Tennessee, which has a displacement of 4,840 tons and a tonnage or carrying capacity of 2,840 tons. She has greater speed than any other vessel in the Navy, and has a battery of eleven 8-inch converted rifles, the most formidable armament on any vessel of the Navy, though weak as compared with those on European vessels of war.

The only other vessels which have been added to the Navy by the express authority of Congress since 1865 are the torpedo boats Intrepid and Alarm. The Intrepid has neither gun nor torpedo machinery on board.

The Alarm is armed with one 15-inch smooth-bore gun, similar to those in use on the monitors. She is able to carry a much heavier gun, and if she could have a 12-inch breech-loading steel rifle, even in her present imperfect condition, she would be the most formidable vessel in our Navy. She has a maneuvering capacity unequalled by any vessel of her size in the world. She has been much improved in speed by the introduction of the Mallory steering-wheel. Her engines are not, however, such as to give her the best result. She has many points of excellence which I hope to see at no distant day utilized in better vessels of her class.

This is the extent to which Congress has gone in the direction of improving the Navy by direct enactments since 1865.

A great deal of money has been expended since that time in repairing and rebuilding the old ships left us at the close of the war, and keeping them in condition for service during this period of profound peace. Whether the money has all been wisely, prudently, and economically expended for that purpose I am unable to say, and I cannot know. But all the navy we have to-day is the remnant of the old navy of 1865, repaired, rebuilt, and reconstructed out of the ordinary appropriations, and the remaining seven sloops of war built under the act of 1873—the Huron having been lost at sea—and the two torpedo boats.

While Congress has thus for so many years deliberately neglected its duty to the Navy, the Navy Department has in spite of that neglect maintained a navy as formidable as that which we had at the end of the year 1865, after we had reduced our war navy by the sale of purchased and useless vessels, and has even improved upon it. We have now fourteen single-turreted iron-clads in good condition, which since the war have had their wooden beams removed and replaced with iron. But for this wise action of the Navy Department they would now all be like the Dictator, rotten and unfit for any possible service.

THE REBUILDING OUTCRY.

The five double-turreted iron-clads—Puritan, Monadnock, Miantonomoh, Amphitrite, and Terror—which were originally wooden vessels, and became by decay unfit for further service, are now wholly iron vessels, partially finished. They are going through the process well understood in the Navy long before the war and in all administrations, now designated by the gentleman from Tennessee in all his reports and speeches as "rebuilding under the name of repairs." He is free in his denunciation of the naval authorities for having exercised unlawful power in thus trying to maintain and keep up the Navy. In his eyes it is a crime for a Republican administration to "rebuild under the name of repair" any vessel of the Navy, notwithstanding it is but following the precedents and practice of every Democratic Administration which preceded it.

Nearly our whole fleet of old vessels now in the service which were left to us from the war have been maintained in use by substantially rebuilding them. The Brooklyn, the Richmond, the Lancaster have all been lately brought from rotten row into our cruising fleet by this process, and the Hartford is undergoing the same operation, and will soon take to the sea again, as good a ship in all respects, if not better, than she was the day she won her fame under her great commander.

It may be popular for members of Congress to denounce cabinets and administrations, to charge fraud, corruption, and high crimes upon the men who have the responsibility for the practical administration of the affairs of a great Department like that of the Navy, and to pretend to see bribery and jobbery in every contract or transaction. But for myself, I venture to say, that until we will do our duty here and make just and proper appropriations, and surround them with proper safeguards and limitations, and do all in our power to secure the best interest of the Government and people, we had better be a little modest in our strictures upon the conduct and motives of others who have responsibilities as heavy, and reputations as dear and sacred as our own.

That we have any Navy at all capable of bearing our flag we have to thank not Congress so much as the men who have administered the affairs of the Navy Department since 1865. They may have violated the strict letter of the statute in some instances, or exercised doubtful authority, but as yet all attempt to bring home to any one of them proof of corrupt motives or willful violation of law to serve their personal gain have utterly failed. The time seems now to have arrived when Congress should turn from groping in the rubbish of the dead past in search for the evidence of wrong-doing to the consideration of the demands of the present, and to anticipate the necessities of the great future of the country.

IRON-CLADS.

One of the practical questions before us distinctly raised by the provisions in this bill is, shall the five double-turreted iron-clads be finished? Upon this question I care to say but little, and I care but little. The Naval Committee took the precaution to visit those on this side the continent before forming or expressing any opinion. We are fully satisfied that their workmanship thus far is of the very best class. The hulls and boilers of the three not yet launched are completed so far as they can be before the engines are put in, except as to armor and turrets. The Monadnock on the Pacific side is understood to be in similar condition. They have cost nearly or quite \$4,000,000. The iron of which they are constructed, as has been shown by the gentleman from Tennessee, [Mr. WHITTHORNE,] in his former reports and in his speeches, came mainly from the old ships and iron-clads which were destroyed and removed under a former administration. That old iron was exchanged with manufacturers who had facilities for reworking it, which the Government had not, at the rate of 1½ cents per pound for the old and 5 cents per pound for new, rolled and worked into forms and shapes adapted to the new vessels. That exchange has been condemned as unlawful, unwise, and even fraudulent.

Much personal censure not to say abuse has been heaped upon the heads of the parties to it. I cannot now waste time to inquire whether the exchange was wise or unwise, lawful or unlawful, or whether done in perfect good faith toward the Government. Persons who know what the value of old iron was in 1875 to 1876, and what the value of new plate bar, angle, and beam iron rolled to dimension was at that period, can judge as to the fairness of the contracts. I shall not assume to judge. It is now enough for me to know that the material out of which these great vessels were constructed came from the scrap-heaps of the various navy-yards, and that the vessels belong to the Government, and must now be finished and made of use for the national defense or condemned and sold; and that as soon as may be. The question now is, shall they be finished? I have here comparative tracings furnished me by the chief of the Bureau of Steam-Engineering, showing the relative defensive power of the American iron-clads, as compared with similar English iron-clads.

Although I cannot show these tracings to every person in the House at once, all gentlemen desiring to do so may examine them. These two exhibit the comparative strength of the British turret iron-clad Agamemnon, of 8,490 tons displacement, and the United States turret iron-clad Miantonomoh, of 3,815 tons displacement, now unfinished.

Here are two which make a comparative exhibit of the strength or defensive power of the British iron-clad Inflexible and the iron-clad Puritan, of the United States Navy, now also unfinished. The Inflexible is of 9,515 tons displacement, and the Puritan of 5,000 tons displacement.

The English ships are of course much larger than the American, and armed with modern guns. Whether the English vessels would be able to resist successfully such guns as they themselves carry may be uncertain, as the improvement in guns has almost outrun in the race the resisting power of armor. But the tracings I think show that the relative difference in the defensive power in these vessels is not so great as some people imagine. When the United States monitors are finished as they may be, with solid steel or steel-faced armor, with a backing of twenty-four inches of oak, with the coal-bunkers five or six feet thick filled with coal, which has been proved to be a good defensive auxiliary, and with steel-faced or solid steel

turrets of proper thickness, I think no vessel afloat belonging to any nation capable of coming to our waters would like to engage them if properly armed.

I know there has been much talk about them and that they have been severely criticised. They have been a general subject of unfriendly comment among naval officers. It is said that they were unlawfully commenced and that a great wrong was done in rebuilding them. Perhaps they suffer unreasonable criticism on this account. But the ships are on the stocks in private yards in an unfinished condition.

When the Committee on Naval Affairs went a few weeks ago to look at these vessels the Chief of the Bureau of Steam-Engineering accompanied us. We also had with us a line officer of the Navy of ability and experience, whose opinions would generally have great weight. This officer was asked to examine carefully their lines and the general character of the vessels and to give us his opinion of them. He reported after examination that if we were to build new vessels to-day from the keel up we could not improve upon these models. In his opinion the only question as to their efficiency depended upon the manner in which they were completed and armed. In this opinion Mr. Shock, I think, fully concurred. It has been said that they would not float when finished, armed and equipped, and ready for sea. But the Miantonomoh is afloat with all her machinery on board, and is high out of water, and it is said by those competent to judge that when her turrets and guns are adjusted, and her coal and stores are on board she will float even higher out of water than was calculated when she was commenced. The Amphitrite, the Terror, and the Monadnock are in all respects like the Miantonomoh in size and design. The Monadnock is in the private yard of the contractor on the Pacific coast. The Government owes the contractor, Mr. Burgess, several thousand dollars on account, and will neither take the vessel away and pay him the reservations due him nor allow him to finish his contract. He is now an old man, nearly or quite eighty years of age, and is much broken down in health. This injustice ought not longer to be inflicted upon him, for no one charges him with any wrong.

These vessels are all of one general type. If upon a careful and intelligent examination of them it shall be determined that they will not float sufficiently high when completed as originally designed, changes can be made which will remedy the defect. One turret instead of two can be put on them. The four now on the stocks are not so far completed that this or other changes cannot be made in them if it is found necessary or expedient.

When I was asked by the Secretary of the Navy, not long since, what would be the least I would advise should be done to these vessels, I gave him this opinion, and I will take the liberty to give the same as my advice to this House now.

If you will not finish them as originally designed, then, in the interest of economy, I would recommend that you spend \$50,000 upon the Puritan and \$25,000 upon each of the others to put their shafts and propellers on, stop up all of the valves in the hulls, launch them, and take them down into the fresh waters of the Delaware, and let them wait there until you are ready to make the necessary appropriations for their completion, and then make appropriations, as may be hereafter determined upon, for their completion. That, I say, is the least that ought to be done.

Mr. ROBESON. Will the gentleman yield to me for a question?

Mr. HARRIS, of Massachusetts. Yes, sir.

Mr. ROBESON. I desire to ask the gentleman from Massachusetts whether the provisions of this bill do not do exactly what he advises. The provisions of this bill are, as far as these monitors are concerned, to put the turret on the Miantonomoh, which is completed except her turrets; to launch the others from the private yards in which they are, and to do nothing upon the hulls, nothing upon the armor, but to expend the remaining money appropriated, that is, a million of dollars, upon the engines and the machinery of such vessels as the Secretary of the Navy may think for the best advantage of the service to expend it upon. Now, I desire to ask the gentleman from Massachusetts, because he is thoroughly familiar with the subject, and I desire his statement to fortify my own, whether anybody has ever objected to the plans with regard to the engines or machinery, or has suggested any modifications in them from the beginning to the end of this matter; and whether we are not now reserving, upon the question of armor and the hulls, the right and the power in the Navy Department and of Congress in the future to direct such modifications in the kind of armor as the experience of lapsing time may suggest?

Mr. HARRIS, of Massachusetts. I understand, Mr. Chairman, that in the pending bill there is a provision for launching the vessels in the best manner, and a provision for carrying on the work upon their engines and machinery only in the appropriation made for the construction and repair, which I think, by the way, is put in the wrong place, for it is found in the appropriation for steam-engineering—

Mr. HISCOCK. It is put under the control of the Secretary of the Navy, who can authorize it to be expended as he may judge most effective.

Mr. HARRIS, of Massachusetts. I accept all that this bill does for these vessels, but I want to put on record here my conviction that the duty of the Government is to complete them. I would not urge their completion at once, but would launch them simply to get them

away from the private ship-yards, and let the question of their completion be determined hereafter. I would not have it said that the Puritan should not be finished because she stands in John Roach's private ship-yard. If there is any stigma upon the contract with him, I would take the ship entirely away. We ought to finish them, and I would not pause to consider the question whether John Roach has been perfectly honest or not in his contract with the Government. Mr. Chairman, I would not cast a word of reproach upon that citizen, for I believe him to be one of the best ship-builders in this country, and so far as I know he is as honest as any man on this floor, and as free from any desire or intention to injure or take advantage of the Government. The other contractors are also men of reputation and high standing in the community. We owe them money. We should allow them to complete their contracts, or pay them what is due and take the ships out of their way.

Mr. WHITTHORNE. Will my friend yield to me for a question? Mr. HARRIS, of Massachusetts. Yes, sir.

Mr. WHITTHORNE. Now, Mr. Chairman, I simply ask my friend from Massachusetts, when he states that if these vessels are completed, as they may be, that is with steel armor, and with the backing he designates, if there is anything in this bill that does that thing?

Mr. HARRIS, of Massachusetts. No. Mr. Chairman the gentleman in his speech complained of the provisions concerning the iron-clads that there were not sufficient guards thrown around that appropriation of money.

Mr. HISCOCK. If the gentleman from Massachusetts will permit me, I will say in answer to the gentleman there is no appropriation in the bill for armor at all.

Mr. ROBESON. None whatever.

Mr. WHITTHORNE. Pardon me. Right in there, as we may discover when we come to the sections of the bill, I beg leave to state to my friend that there may be a "large bug under that chip."

Mr. HISCOCK. The gentleman will not succeed in finding it.

Mr. HARRIS, of Massachusetts. Mr. Chairman, I am not of a suspicious nature. I believe we have to trust somebody, and I am ready to trust the present Secretary of the Navy. If I were here a Republican, as I am, with a Democratic administration in power, I do not believe I would be so unpatriotic as to say that the Navy of the United States should not receive assistance or aid from me until the Republican party got into power again. I do not believe that to be the proper spirit by which a member of this House should be governed.

I do not think I would say, as I heard said on this floor not very long since, that my party would make no appropriations for the Navy to be expended under a Democratic Secretary. If I should so act, I think I should be open to the suspicion of being governed more by a love of party than of my country.

I hope and believe, if the question were presented to me with a Democratic administration in power, that I would have patriotism enough to say, whoever rules the country, that such measures should receive my support as are for the best interests of the service. It is in my judgment essential that the country should be protected and defended by land or sea, and I shall be always willing to support just and adequate appropriations for that purpose. I believe that is statesmanship, even though it may not be good politics.

I am sustained in my opinion that the iron-clads should be finished by Mr. John Lenthall, who is always authority on the other side.

In a report which he made upon the subject to Hon. R. W. Thompson, the late Secretary of the Navy, April 27, 1880, in reply to a joint resolution passed April 2, 1880, which required him to report, first, whether it is to the interest of the Government to complete them; second, whether, if so, it is to the interest of the Government to complete them according to the existing plans, models, and agreements; and third, if any change is demanded in order to make said vessels more efficient for war purposes; and to inquire into the extent and character as well as cost of such modifications as they should deem necessary, and into any other fact material to each of the foregoing questions, he said:

In conclusion, in reply to the first inquiry of the joint resolution, it is thought to be to the interest of the Government to complete the vessels; second, but it is not considered to be the interest of the Government to complete them according to the existing plans and agreements; and, third, the changes demanded to make them more efficient (excluding the question of the turrets) is to increase the strength of the hull, to increase the thickness of the armor, and to substitute a superior metal, the total cost of which is estimated for each vessel to be less by about \$48,000 than that contemplated in the bureau order for the hull which has been suspended, and a reduction of \$40,000 for each vessel in the cost of the machinery yet to be made under the existing order.

Mr. HEWITT, of New York. Will the gentleman be good enough to inform us whether the Miantonomoh has been strengthened according to the recommendations of Mr. Lenthall?

Mr. HARRIS, of Massachusetts. I think the Miantonomoh is in substantially the same condition now that she was when that report was made.

Mr. HEWITT, of New York. Do the drawings which the gentleman submits show the Miantonomoh as she was to be or as she is?

Mr. HARRIS, of Massachusetts. As she is. Now, with reference to these vessels, while I feel that they should be finished, I am not wedded to any particular plan. I am not competent to determine upon any plan. But I ask this House to authorize the Secretary of

the Navy or some other competent authority to determine in what manner these vessels shall be finished before the work on their armor is commenced upon.

In recent years there have been improvements in the matter of armor. The English Government has adopted systems of armor quite different from those in the original designs of the Terror, the Amphitrite, the Monadnock, the Puritan, and the Miantonomoh. An officer of the American Navy has devised a system of what he calls deflective armor—a system which is worthy to be considered by the highest and best officers of the American Navy. I would like this House to take such steps that these vessels, which have cost a large sum of money, shall be put on the way to be completed in the most effective manner. Beyond that, I have no wish in the matter, and I should yield my own opinions upon any question of mere form or method of completion. I desire to say no more upon this question.

THE UNITED STATES NAVY OF 1862 AS COMPARED WITH THE UNITED STATES NAVY OF 1865.

Mr. Chairman, I turn aside here to say a word personal to myself. I may do so as well at this point as anywhere.

It has been said of me (very unjustly I am happily able to demonstrate) not here, I believe, nor anywhere I think by persons who know the exact facts, or have no motive for misrepresenting them, but elsewhere, and in some unfriendly newspapers—that in 1875 and 1878, or at some time five or six years ago, I represented in some report or speech that the American Navy was in very fine condition, better than ever before, and formidable for offensive or defensive war; but that lately, in 1880 and 1882, in the last reports upon the Navy which I have prepared for the Naval Committee and presented to the House, I have represented it in a hopelessly wrecked and ruined condition, and utterly incapable of either offensive or defensive warfare. In other words, that I have made public statements concerning the Navy at one period which I have contradicted at a later period.

Justice demands that now and here, where my action upon the subject is best understood, I should exhibit the record as my full vindication from any charge of inconsistency.

In the investigation of the administration of the Navy Department, conducted by the Committee on Naval Affairs under the direction of Mr. WHITTHORNE, its chairman, in 1875-'76, I, as a member of the committee, took part. I had the duty in part of writing the report of the minority of the committee. Then, if ever, was the time when I represented our Navy as in a satisfactory condition. If not then, then never. Let us turn to that report and see. I read from report No. 784, Forty-fourth Congress, first session, page 180, this language, of which I am the author:

At the close of our late war the United States were far beyond the rest of the world in the matter of iron-clads and turreted vessels; since that period no new iron-clads have been authorized by Congress and many of the older ones have gone to decay and have been withdrawn from the service. But during this period the great naval powers of Europe have been industriously at work in constructing large, costly, heavily-armed, sea-going iron-clads, and other vessels of great speed and power. That we have no vessels in the American Navy which can compete with these is a fact, and it needs no long argument or great amount of proof to establish it. It is a recognized fact not denied by the Navy Department; it is a fact, however, if at all to the disadvantage of the American Navy, which is not chargeable to the Navy Department but to Congress.

It appears from the testimony of Captain Shufeldt, Chief of the Bureau of Equipment and Recruiting, (at page 676, miscellaneous proof,) that he visited, on a tour of inspection, in March last, all the ships belonging to the North American squadron. When asked the condition of the Navy to-day, as compared with what it was in 1869, he says:

"I think it is in a great deal better condition to-day than it was in 1869." According to his statement, the condition of the ships in 1869 and 1876, respectively, was as follows:

In 1869 there were in good condition only 12 vessels, while in 1876 there are 70 vessels; in 1869 there were in that condition known as fair 25 vessels, while in 1876 there are only 14; in 1869 there were wanting important repairs 24, in 1876 only 16; in 1869 there were wanting extensive repairs 76, in 1876 only 15; there were in 1869 unfit for repairs 58 vessels, and in 1876 there were only 10."

This is from the first report ever made by me on the subject of the Navy. It will be seen that while I thus publicly declared our naval weakness as compared with the navies of other countries, I was simply saying what I am ready now to maintain, that our Navy of 1876 was, as compared with itself, stronger than at any period before the war or since the close of the war in 1865. The extract from Captain Shufeldt shows how much stronger it was in 1876 than in 1869, four years after the close of the war. Let us go now to the Navy of 1861, when the war opened. What was our Navy then? I find in that admirable and most valuable book by Chief Engineer J. W. King entitled "The War Ships and Navies of the World," edition of 1880, at page 378, the following:

List of ships belonging to the Navy April 1, 1861.

Steam screw frigates.....	7
Steam screw corvettes, first class.....	6
Steam screw corvettes, second class.....	8
Steam screw corvettes, third class.....	5
Side-wheel ships, first class.....	4
Side-wheel ships, second class.....	4
Sailing ships of the line.....	6
Sailing frigates.....	10
Sailing corvettes, first class.....	5
Sailing corvettes, second class.....	15
Sailing brigs.....	3
Receiving and store vessels.....	9
	— 48
Total.....	82

The Navy of 1861, as we see, had forty-eight sailing-vessels which were then supposed to possess some value as fighting ships, and thirty-four vessels propelled in part by steam, eight of which were side-wheel vessels, even then out of date for war purposes, leaving only twenty-six screw steam-vessels in our Navy.

Between 1865 and 1869 there was no doubt great deterioration in the Navy. The nation rested after a great war, and its ships, many of which were built in haste and of poor material, went rapidly to decay. From 1869 to 1876 great activity prevailed, and really the complaint in 1876 was that in an effort to save and restore the Navy too much money had been expended. The investigation of that year was in fact in part instituted upon charges of waste, extravagance, and corruption in the expenditure of money upon the ships of the Navy.

I think I should not be far wrong in saying that the American Navy, feeble as it truly is as compared with European navies, as compared with itself in its past history is in fair condition, more formidable than it was in 1861 or in 1869, a little less so than it was in 1876, because of the neglect and hostility of Congress toward it since that time. Since 1876 some vessels have become worthless and only one has been added, the Nipsic, which was two-thirds finished at that time.

Wooden sailing-vessels and side-wheel steamers made the bulk of the Navy in 1861. The iron-clad was unknown and the monitor had not even been dreamed of. When the Merrimac and Monitor met in conflict March 9, 1862, they settled several important questions in naval warfare. Then it was made certain that for harbor and coast defense thick armor and heavy guns could only be relied upon. The Merrimac had the day before demonstrated that sail-power and wooden walls were out of date in war. In the conflict of one brief hour a lesson in naval warfare was taught which all the naval powers of the world have learned by heart, and which nearly all have profited by more than the United States. We have now in our Navy fit for service fourteen iron-clads, every one of them of iron, and much more formidable than was the Monitor of 1861.

VIEWS OF THE NAVAL AFFAIRS COMMITTEE.

The Committee on Naval Affairs have in their reports to this House at this session shown the Navy substantially as it is. The list of all the vessels, their present location, use, and condition, is shown in the extracts from those reports, hereto appended.

I have never at any time or place in any report or speech undertaken to say that our Navy was worthy of our country or at all to be compared with the navies of other powers. In the report made to the House by the Committee on Naval Affairs, which the chairman [Mr. WHITTHORNE] did me the honor to intrust to me to draw, and which had the unanimous approval of that committee, and which was reported May 7, 1878, and numbered 662, may be found the following:

Our relative naval strength as compared with the leading naval and maritime nations is shown by the following extracts from Martin's Year-Book for 1878, descriptive of the navies of France, Germany, Great Britain, Italy, Spain, and Turkey.

It is probable that among the ships composing the navies of these countries there are some which, like many in our own Navy, are useless for war purposes; but the iron-clad vessels of those countries, it must be borne in mind, are comparatively new, having been all built since we ceased building. They are in a large measure, if not wholly, creations inspired by the Monitor, and there is every reason to suppose that they are great improvements upon that vessel, and that they are generally in a condition fit for war.

Here followed lists of the navies of France, of Germany, England, Italy, Spain, and Turkey. The report then continues as follows:

The facts here presented are startling, and so humiliating that no argument from the committee will be needed to arouse Congress, or if not Congress the country, to a sense of insecurity and danger which will demand that immediate steps be taken to strengthen our means of defense at home, and to provide a fleet for service at sea worthy of a nation hitherto occupying a proud eminence as a naval power, and having a record in the annals of naval warfare of which older nations might well be envious.

The committee will not in this report pause to inquire how it happens that our Navy is in such feeble and unsatisfactory condition, nor to whom the blame belongs. On those questions we might differ. Upon the facts here presented, and upon the lessons of patriotism and duty which they teach, we do unanimously agree.

We agree that it is our duty to recommend to Congress that immediate and adequate measures be taken for the formation of a new and formidable navy. We should not, however, enter rashly or with wasteful extravagance upon the work of building costly and ponderous vessels capable of contending in mid-ocean with iron fleets of Europe. Such vessels will never be useful to the United States, and their value to any nation is yet problematical. We are prevented alike by distance and our national policy from participating in the conflicts which constantly menace the powers of Europe. If we will defend our own shores, and protect our commerce on the sea, we shall be invincible at home and respected abroad. We have no colonial dependencies to be either defended or held in subjection by force, and no neighbors either powerful enough or ambitious and unjust enough to covet our possessions or seek to divide us. With peace and prosperity among ourselves we shall require but small armies and navies. But if war is thrust upon us we should be prepared to meet and beat back the most powerful enemy, and we should also be in condition to carry on aggressive war upon his commerce, in ships so swift and destructive as to sweep it from the ocean. We know the demoralizing effect upon commerce of a few swift cruisers gallantly commanded. England knows how much she gained by the destruction of our commerce during our late civil war, and how little she paid as damages for her participation in that destruction. We remember how much we suffered also.

Should, unfortunately, war ever come between England and the United States, and should the latter put upon the ocean to prey upon the immense commerce of Great Britain a few swift, well-armed, and powerful cruisers, we know how terrible would be the retribution. Her great iron-clads met at our shores by coast and harbor defenses, torpedoes, rams, and iron-clad batteries, could not do us half the damage which twenty-five such vessels could do her upon the sea. The fact that we were in readiness for such a contest would keep the peace and compel her to

submit to our just and reasonable demands, and we are not likely to make other demands of a nation in whose honor and glory we have so great and so proud an interest. What we have said of England will apply to any other of the commercial nations. To be ready for war is to be secure in peace.

But we are not ready for war; we are wholly unprepared. We have, however, profound peace, and therefore the time to prepare for war.

We may begin carefully, and may consult and exercise in our preparations the most rigid and scrupulous economy. We have no need to enter upon expensive, doubtful, and wasteful experiment.

While we have been doing nothing in the way of experiment during the last thirteen years, and have been year by year reducing and curtailing our naval expenditures, and even suffering our ships to go to decay, all Europe, indeed the whole world, has been carrying to fullest demonstration the experiments which in our extremity we began.

The net results of those vast expenditures and dreadful failures and great successes we can now have the benefit of at the least possible cost.

This fact goes far to reconcile us for our present feeble naval power.

They have had the experience and suffered the loss; but the fruits are ours, in part at least.

They have the ships and the guns, to be sure, but they have the bad ones as well as the good ones.

We can imitate and, I have no doubt, improve upon the good ones, while the bad and worthless ones will be theirs alone.

In another part of the same report occurs this language:

We have been thus particular in giving the present condition, age, armament, and displacement of each vessel of the Navy, that our actual strength as a naval power may be fully understood and if possible realized by Congress and the country. We have attempted to strip off all disguises and to penetrate all mysteries, and to present the undisguised and simple truth.

In guns we are not less feeble than in ships, as will appear from the following statement furnished by Commodore W. N. Jeffers, Chief of the Bureau of Ordnance, showing how each vessel now in service, and such as by completion or repair may be made serviceable, are or will be armed. As compared with the guns other navies, they are by no means creditable to us.

On the 23d of May, 1878, in a speech delivered on this floor in advocacy of a bill known as a "bill providing for the establishment of a board of assistants for the Navy of the United States, and for other purposes," some of the leading provisions of which the Committee on Appropriations have adopted in the bill before us, and are now at last likely to be enacted, I said:

It was to me a most startling and astounding fact, when I learned that our whole present effective naval force, both for offensive and defensive naval purposes, consisted of only forty-three vessels, carrying two hundred and forty-five guns and having an aggregate displacement of 80,665 tons.

Such is, however, the truth. We have practically no navy worthy of the name, and I think the announcement should be made in the most public manner in order that the country may know and understand it, and that Congress may prepare itself for the adoption of some wise future policy in its naval affairs. It is wise that statesmen having the well-being and honor of the country in their keeping should know the whole truth, however humiliating and alarming, to the end that they may promptly seek and apply the remedy.

I do not propose to say by whose fault it happens that our Navy is in its present shamefully weak and feeble condition. I propose to accuse no man—to defend no man. I cannot refrain from saying, however, in passing, that Congress itself, by its neglect of the subject during the whole period since the close of the war, must be and ought to be held to answer for a large share of the responsibility for our present naval weakness. Congress cannot plead in defense want of information or admonition. Every year since the close of the war the condition of the Navy has been made known, and Congress has been repeatedly warned that without more and better ships the country would in case of war with one of the great naval powers be helpless, and would suffer defeat and disaster. During that whole period, however, Congress has authorized the construction of only eight small sloops of war.

I think I am justified upon this exhibit in saying that we have practically no navy. If foreign war should come upon us we should be less able than at any other time in our history as a nation to defend our own shores from invasion, and we could not strike an aggressive blow upon the sea if we relied alone upon our Navy proper.

I am not forgetful of the fertility of American inventive genius or the heroic daring of American naval officers and seamen, and I have little fear that any foreign enemy could successfully invade our shores or possess themselves of our great ports and harbors. The torpedo and other means of defense so well understood by our people would doubtless protect us in this respect. But our present Navy would be driven in disgrace from the seas and compelled to seek ignominious protection behind our coast and harbor defenses, and our commerce, left unprotected, would fall an easy prey to the enemy. For a great nation like this, bounded by two oceans, rich in all the natural resources and capable of leading in the commerce of the world, and having a hardy and daring population ready and anxious to carry our flag in honor and in glory into every sea where commerce invites, and to defend it against every foe, whether foreign or domestic, this condition is dishonorable and even disgraceful.

Since the close of our civil war we have been strangely neglectful of our Navy and of our rank as a naval power. At the opening of that memorable struggle we held a position of substantial equality with the other nations. We had not, to be sure, a great Navy as compared with some others, but our ships were the equals class for class, our guns as powerful and our officers and seamen as brave and skillful as those of any nation. The weapons of naval warfare were then understood equally well by all, and could be increased and multiplied by all or any, as the demands of war or the interests of commerce might seem to require.

Then personal daring and prowess counted for something in naval conflict, and indeed, as may be illustrated abundantly from our own naval history, often compensated for lack of ships and armament. At that time the American Navy was formidable alike for offensive or defensive war, and was held in respect at least by all the other naval nations. Our ships were as fast, as well armed, manned, and commanded as those of any nation, and their models were among the finest in the world.

The history of the American Navy is the pride of every true lover of his country. It has accomplished in the short period of its existence as much as any navy in the world, and has won victories both of war and peace as renowned and glorious as any recorded in the annals of time. It is devoutly to be wished that its future may be as honorable as has been its past history.

But no honorable future awaits it unless Congress shall provide new ships and armament equal to the requirements of improved modern naval warfare and worthy of the nation and the age.

The progress in the last fifteen years in naval architecture, in guns, projectiles, fuses, and exploders has been truly marvelous. All science has contributed to this change. No nation has added more to the world's stock of knowledge upon this subject, or led the way, or pointed out the path to these great improvements with more intelligence than America.

Nevertheless the close of the war found us in possession of an iron-clad fleet the largest and for defense the most formidable in the world, and with a sea-going navy sufficiently numerous and powerful to secure immunity from all danger of foreign war. We had conquered a peace after the most destructive war of modern times and were in condition to maintain it. No nation in that supreme moment of our triumph and exultation had any temptation to engage in war with us. Even England, with her great wealth and resources and her immense naval power, would have found no provocation sufficient to have induced her to try her strength with us. She had, in accordance with her traditional policy, been false to both parties to the contest and had incurred the hostility of both sections. She had taken the confederacy into her pretended confidence and sympathy long enough to plunder and rob the United States of its commerce. That being accomplished and her interests secured, her regard for the confederacy changed to the coldest contempt. She would have looked in vain to this country for aid in a contest with the United States at that time. The payment of \$15,500,000 has not blotted her treachery from the memories of the people of this country nor satisfied them that the debt is wholly paid. At the close of the contest the people of both sections were exhausted, weakened, and impoverished. They had seen war in all its horrors, had felt its cruelties, and were satisfied. They gladly turned from the pursuits and thoughts of war to those of peace.

It is not strange that at the close of the war and when peace was assured the nation pursued the policy of selling off the vessels temporarily added to the Navy, laying up her iron-clads, and reducing her sea-going squadrons to the lowest possible numbers. Is it not strange that we have stood still ever since, doing nothing to increase our power on the ocean, and have suffered our ships, then so formidable, to be destroyed by rust and decay.

But I fear we have fallen into a grave error, which, if not fatal to us, will yet be repented of in sorrow.

We taught the world lessons in naval architecture and naval warfare, which it carefully studied and appreciated and which it has imitated and greatly improved upon. While we have rested, economized, and indulged in pride and vanity over our past achievements, all the great nations have far outstripped us in the means and capacity for war.

Such, Mr. Chairman, is the record. Upon it I think I can stand and defiantly challenge all comers to show that on this question I have ever uttered or written one sentence which conflicts with any other sentence by me uttered or written.

My whole effort has been to show to Congress and the country that while our Navy as compared with itself in the past was in tolerable condition, yet that when compared with the navies of the world it was unsafe to be relied upon for the national defense, and wholly unworthy of this great Republic. That seems to have been my mission. I have tried to be faithful to that mission. Mr. Chairman, I need no other vindication from the accusations I have named and of which I complain than the record which I have thus in part only called up from the forgotten and receding past.

THE NAVAL COMMITTEE AND ITS WORK.

Having said thus much for my own personal vindication, I now return to the subject of the appropriation bill.

The bill reported by the Committee on Naval Affairs for the reconstruction of the Navy to which I have before referred, from which the Committee on Appropriations have been kind enough to extract several important provisions, cannot now be reached or acted upon, but in discussing the bill before us I may be pardoned for explaining to some extent the provisions of that other bill which has furnished so large a part of this one.

Heretofore naval committees of this House, when organized, have been allowed to grope in the dark with little aid from the Navy Department as to the best methods of building up or improving the Navy. No systems have been proposed and no methods suggested.

The late Secretary of the Navy saw and appreciated some of the difficulties which beset the paths of naval committees, and attempted to remove them. He saw, I suppose, how difficult it would be for a Committee on Naval Affairs, composed largely, if not wholly, of gentlemen unfamiliar with the subject, to deal wisely with the great and complex questions involved, unaided by recommendations and suggestions from the Department.

Mr. Chairman, what are the subjects with which the Committee on Naval Affairs is called upon to deal.

The Navy Department is the great mechanical department of the Government. It deals not only with purely scientific questions of great subtlety and intricacy but with the construction of great vessels of war and the wonderfully intricate and ponderous steam-engines which propel them, with guns and their carriages, with gunpowder and other explosives, with all manner of machinery, and with the various weapons of offense and defense made use of in war. I may say without offense that the Committee on Naval Affairs is required to consider more purely technical, mechanical, and scientific questions than perhaps any other committee.

The late Secretary tried to anticipate our necessities, and at least to point out for us a way to useful results.

ADVISORY BOARD.

He organized on the 29th of June, 1881, the naval advisory board, so called. The order under which that board was convened and acted is as follows:

ORDERS OF THE SECRETARY OF THE NAVY CONVENING THE NAVAL ADVISORY BOARD.

NAVY DEPARTMENT.
Washington, June 29, 1881.

I. In order to meet the exigencies of the Navy, it is highly important, in the opinion of the Department, to present in the report of the Secretary at the next session of Congress a practical and plain statement of the pressing need of appropriate vessels in the service at the present time.

Such a statement can best be furnished by an advisory board, who may consult together and be able to reconcile conflicting opinions and theories with reference to the number and class of such vessels as should be constructed, and to unite in recommending such as Congress would be most likely to approve.

II. Accordingly, the following officers in the service are detailed to constitute such a board:

Rear-Admiral John Rodgers.
Commodore William G. Temple.
Captain P. C. Johnson.
Captain K. R. Breeze.
Commander H. L. Howison.
Commander R. D. Evans.
Commander A. S. Crowninshield.
Lieutenant M. R. S. MacKenzie.
Lieutenant Ed. W. Very.
Chief Engineer B. F. Isherwood.
Chief Engineer C. A. Loring.
Passed Assistant C. H. Manning.
Naval Constructor John Lenthall.
Naval Constructor Theo. D. Wilson.
Naval Constructor Philip Hichborn.

III. The board will consider and advise the Department upon the following subjects:

1. The number of vessels that should now be built.
2. Their class, size, and displacement.
3. The material and form of their construction.
4. The nature and size of the engines and machinery required for each.
5. The ordnance and armament necessary for each.
6. The appropriate equipments and rigging of each.
7. The internal arrangements of each, and upon such other details as may seem to be necessary and proper; and lastly, the probable cost of the whole of each vessel when complete and ready for service.

IV. The members of the board will assemble in Washington City on the 11th day of July next, at 12 meridian, and will report to the Department the result of their labors not later than the 10th day of November next.

WILLIAM H. HUNT,
Secretary of the Navy.

The high character of the venerable head of this board and of his associates challenges for their report at least respectful consideration. No men, certainly, comprehend and appreciate more fully than they the wants and necessities of the Navy.

This board convened on the day named in the order, and with great industry pursued their investigations through several months, and on the 7th day of November, 1881, they made their report to the Secretary of the Navy, which has been printed and is now in the possession of Congress. In their report, page 13, may be found as the general result of the work of the board the following:

SUMMARY OF THE NUMBER, CLASS, TYPE, AND COST OF THE VESSELS THAT THE BOARD RECOMMEND NOW BE BUILT.

Two first-rate steel, double-decked, unarmored cruisers, having a displacement of about 5,873 tons, an average sea speed of fifteen knots, and a battery of four 8-inch and twenty-one 6-inch guns. Cost, \$3,560,000.

Six first-rate steel, double-decked, unarmored cruisers, having a displacement of about 4,560 tons, an average sea speed of fourteen knots, and a battery of four 8-inch and fifteen 6-inch guns. Cost, \$8,532,000.

Ten second-rate steel, single-decked, unarmored cruisers, having a displacement of about 2,043 tons, an average sea speed of thirteen knots, and a battery of twelve 6-inch guns. Cost, \$9,300,000.

Twenty-fourth-rate wooden cruisers, having a displacement of about 793 tons, an average sea speed of ten knots, and a battery of one 6-inch and two 60-pounders. Cost, \$4,360,000.

Five steel rams of about 2,000 tons displacement, and an average sea speed of thirteen knots. Cost, \$2,500,000.

Five torpedo gunboats of about 450 tons displacement, a maximum sea speed of not less than thirteen knots, and one heavy-powered rifled gun. Cost, \$725,000.

Ten cruising torpedo-boats, about 100 feet long, and having a maximum speed of not less than twenty-one knots per hour. Cost, \$380,000.

Ten harbor torpedo-boats, about 70 feet long, and having a maximum speed of not less than seventeen knots per hour. Cost, \$250,000.

Total cost of vessels recommended now to be built, \$29,607,000.

As will be noticed, they recommend in this summary the construction of sixty-eight vessels or eight different classes. Such in their opinion are the present necessities of the naval service.

They recommend as the first in character, if not in present importance, two first-rate steel double-decked unarmored cruisers, having a displacement of about 5,873 tons, a sea speed of fifteen knots, to be armed with 8 and 6 inch breech-loading guns. They estimate the cost at \$3,560,000, or \$1,780,000 each. This estimate covers not the hulls alone, but the completed ship, with engines and armament and ready for equipment and stores. This estimate includes the cost of guns of modern types and of high power and great range.

The estimates for all the other classes of vessels named in this summary were equally thorough and complete. They are of course but estimates and may be and probably will be exceeded in execution of the work recommended. Estimates usually are; but they are the calculations of careful and experienced men. The recommendations when carried out will require thirty or forty millions of dollars. But these vessels alone would make a cruising navy of far greater strength than that which we now have, which has cost vastly more.

The board also recommended the construction of six first-rate steel double-deck unarmored cruisers, having a displacement of about 4,560 tons, an average sea speed of fourteen knots, and a battery of 8-inch and 6-inch guns; the cost of which was estimated to be \$8,532,000, or \$1,422,000 each. These were also completely equipped; they were armed and prepared to take the sea to do effective service as cruisers. Then they recommended ten second-rate steel single-decked unarmored cruisers, having a displacement of about 2,043 tons, an average sea speed of thirteen knots, and a battery of twelve 6-inch guns, costing \$9,300,000. They also recommend twenty wooden cruisers; five steel rams of about 2,000 tons displacement, with an average sea speed of thirteen knots; five torpedo gun-boats of about

450 tons displacement, with a maximum sea speed of not less than thirteen knots; ten cruising torpedo-boats about 100 feet long, having a maximum speed of not less than twenty-one knots per hour, and ten harbor torpedo-boats about 70 feet long, having a maximum sea speed of not less than seventeen knots per hour; and the total estimated cost of all these vessels is put down at \$29,607,000.

THE WORK OF THE PRESENT NAVAL COMMITTEE.

When our committee assembled at the commencement of this present session of Congress, these were problems which we had to deal with. The majority of the advisory board recommended or agreed that the ships should be built of steel. The board was not unanimous in this. They also had some difference of opinion as to whether the second-class vessels should have been spar or open decks, and these questions were referred to our committee. We were authorized to commence an investigation into the subject, and I think no one will deny that the committee has faithfully discharged its duty. Certainly no gentleman who has read the testimony taken, and the report of the committee, will fail to give us credit for an honest effort to get at the truth.

We felt constrained, before adopting the views of the board as to the kind of ships to be built, to determine for ourselves if possible and to give Congress the information upon which to base a determination also what material ought to be used in their construction. In commencing so great a work it would be folly not to select the very best possible material. These ships when built may last fifty years. They certainly will outlast any wooden steam-vessel ever built many times over. We felt it to be our duty to recommend the building of no ship which would not be in all respects equal to and if possible superior to any ever built for cruising purposes. We think that no cruising ship at this day should have an average sea speed of less than fifteen knots, and even this is too low. In the bill we have provided that the two largest ships shall have an average sea speed of at least fifteen knots per hour. There are but few vessels in the world, even in the merchant-marine service, that can attain and long sustain that speed; perhaps not a dozen in all. But the age is a progressive one. We are to build for the future, and we should secure in our new vessels all the attainable speed. We should discount as much of the future as possible.

STEEL AND IRON.

To enable us to decide the problem left to us by the advisory board, by reason of their disagreement, we invited before us the largest manufacturers of steel and iron in the country. Many came bringing specimens of their manufactures. We had specimens from the Norway Iron and Steel Works at Boston, Park Brothers & Co. of Pittsburgh, the Otis Steel Works of Cleveland, and Shoenberger & Co. of Pittsburgh.

I hold in my hand two pieces of steel plate, one from the works of the Otis Company of Cleveland and one from Park Brothers & Co. of Pittsburgh—steel of the mild type, capable of bearing a terrible strain of 60,000 pounds to the square inch and having an elongation or ductility of 20 to 25 per cent. when used cold. I have also here an equally good specimen from each of the other establishments named.

The specimen I now hold I saw folded cold under a steam-hammer at the navy-yard. It was a piece of steel taken at random out of the scrap heap. It presents no sign of strain or fracture. It will be noticed that they are specimens of $\frac{1}{4}$ -plate steel, and that they are folded two ways or four double and driven down perfectly flat, as you might fold a pocket handkerchief. I now take up a piece of plate iron of the same thickness. It is the same kind of iron usually used in plating iron ships. It is said to be of a good quality and better than much which is used for that purpose. As you see, in bending cold it fractures at 65 degrees. The best of rolled plate iron is laminated and splits, and when used in boilers is liable to blister. In its manufacture the different layers of which it is composed do not become perfectly welded. Not so with steel. It is cast into ingots and then heated and rolled into plates. It is homogeneous and cannot laminate. It is perfectly welded in every part. Steel can never present the appearance shown in this piece of blistered boiler-iron.

We have recommended that steel be used in all the vessels which we have recommended to be built. We propose, in view of the present condition of the Navy, that only the best and the largest ships recommended by the advisory board shall now be undertaken, two of the largest and four of the second size. These, with the steam-ram and the torpedo-boats recommended, will cost the sum of \$10,000,000, if built of steel, equipped, armed, and ready for the ocean.

It was urged by some members of the advisory board and by others that it might not be prudent to limit the Department to the use of steel in the construction of these vessels, because it was not certain that steel in sufficient quantity, of the proper quality, could be produced in this country. But the investigation, we think, ought to remove that doubt. The evidence reported satisfied the committee, I think, (it certainly satisfied me,) that the quantity is fully equal to any demand of the Government. This is, if not the first, not less than the second steel-producing country in the world, and our progress in the direction of steel production is now very rapid. It is also true that the American mild steel is unrivaled by any

made elsewhere. So much for the bill reported by the Committee on Naval Affairs.

TORPEDO-BOATS.

Since that bill was reported, and in view of the fact that we have no cruising iron-clads and no iron-clads except the fourteen small single-turret iron-clads for use in harbors and rivers and in comparatively smooth water, and in view of the recommendation of the advisory board that "five torpedo-gunboats of about 450 tons displacement, &c., should be built, the Committee on Naval Affairs have voted to recommend to the House as an amendment when the bill shall come up for action a provision authorizing the construction of five torpedo-gunboats of not less than 450 tons displacement each, having an average sea speed of not less than thirteen knots per hour, and the fullest maneuvering power, and capable of carrying each one breech-loading rifle gun of high power of not less than 10-inch caliber."

The reason for this action on the part of the Naval Committee should be stated. As I have before said in speaking of the unfinished iron-clads, there has lately been introduced the idea of deflective armor. We have one ship in our Navy which is adapted to this kind of defense. She has been very much criticised, and by many persons condemned as a failure. She has been a costly vessel, but I am convinced that she embodies ideas which may be utilized in new constructions and which may prove of great value. I refer to the *Alarm*, which was built under the direction of Admiral Porter and upon plans designed by him.

She had a propelling-wheel known as the "Fowler wheel," which possessed the great merit of being able to turn the vessel rapidly on its center and almost in her own length. That wheel proved a failure in many respects. It did not furnish the speed expected or desired. Congress in its liberality two years ago appropriated \$25,000 for the purpose of putting into that vessel a new propelling-wheel. The wheel adopted was that known as the "Mallory steering and propelling screw."

Since that wheel or screw was placed on board the *Alarm* a board of engineers, consisting of Chief Engineers B. F. Isherwood, Theo. Zeller, and George W. Magee, have, by order of the Secretary of the Navy, examined and very thoroughly tested it. Their report, which is very full and exhaustive of the subject, bears date January 31, 1882. That report did not get into print so that the Committee on Naval Affairs could have the benefit of it until their bill had been reported and placed on the Calendar. The report closes with these words:

As now perfected the Mallory system can be recommended as meeting every requirement of the purposes for which it is intended.

The system is designed both for propelling and steering. Under the control of this screw the speed of the *Alarm* has been greatly improved. It is claimed for her that with a clean hull and engines in good condition she has lately made twelve miles per hour. Her engine is understood not to be equal to her requirements, nor well adapted to develop the best qualities of the vessel. Whatever may be justly said in condemnation of this vessel, she has many advantages. She breaks the water in her forward movement less than any ordinary vessel, for the reason that her under-water torpedo-bow acts as a sharp wedge and divides the water with less surface disturbance than does an ordinary perpendicular prow. Her bows only are armored. By the aid of her wheel she can keep her sharp deflective bows always toward an enemy even in retreat. She can turn round on her center in three minutes, and move backward with slightly less speed than in moving forward. She can carry with safety a much heavier gun than she now has, and should be armed with the modern breech-loading steel rifle-gun of high power, of eleven-inch caliber at least; and it is claimed by some that she can carry even a larger gun.

If we should now build a few single-gun torpedo-boats, utilizing in their construction all the advantages possessed by the *Alarm*, adding such modifications and improvements as experience may suggest, arm them with heavy rifles and improve upon the deflective armor by the use of steel, we should have harbor defenses of real value.

Mr. HEWITT, of New York. Would not the monitors now under construction accomplish the purpose the gentleman aims at?

Mr. HARRIS, of Massachusetts. I am not certain whether the monitors can be provided with the deflective turrets instead of the upright or vertical turrets designed for them or not.

Mr. HEWITT, of New York. But could they be converted into such rams as the gentleman has been describing?

Mr. HARRIS, of Massachusetts. I have not been describing a ram, but a single-gun torpedo-boat with sharp, deflective, armored bows. I do not think the vessels now on the stocks could well be converted into that kind of vessel.

Mr. HEWITT, of New York. That is the answer I wanted.

Mr. HARRIS, of Massachusetts. The monitors are too large for such use. The proposed gun torpedo-boats are to be only four hundred and fifty or five hundred tons displacement.

I am admonished that I must hasten to a conclusion. I shall, with the permission of the House, insert in my speech as printed in the RECORD many things which I now omit for want of time.

GUNS.

I wish to call attention for a moment to the guns with which vessels of the American Navy is armed. It is fashionable now to laugh when our naval guns are mentioned. I sympathize with the fashion. But it was not always so. If we are feeble in guns as well as ships, it is the fault of Congress, and Congress only can remedy the defect. During and at the close of our late war the United States was not behind other nations in naval ordnance, and if we are so far behind them now it is because we have absolutely stood still while all the other nations have been moving in a terrific march of improvement. I refer to a speech which I made in the House on the 14th of April, 1880. I quote briefly from that speech, as I cannot better express now my views on the subject:

The American 11-inch smooth-bore gun was considered in England a most formidable weapon no longer ago than the battle between the *Kearsarge* and the *Alabama*, June 19, 1864, and the English writers at that time declared it to be a better gun than could be found on any English ship. The *London Evening Star*, soon after the battle, in an article describing it, said of the armament of the *Kearsarge*:

"But she also had two 11-inch smooth-bore Dahlgrens; and it is to these tremendous weapons the sinking of the *Alabama* is due."

The *Liverpool Mercury* of June 25, 1864, six days after the battle, said: "It is notorious that there is not an 11-inch gun on board a vessel in the British navy, while on board the *Kearsarge* there are two of these tremendous weapons, each capable of throwing 200-pound shell or shot."

In an account of that battle, written by Frederick Milnes Edge, published in *London* in 1864, is the following, showing the opinion in Europe of the American gun at that time:

"There is but one key to this victory. The two vessels were as nearly as possible equal in size, speed, armament, and crew, and the contest was decided by the superiority of the 11-inch Dahlgren guns of the *Kearsarge* over the Blakely rifle and the vaunted 68-pounder of the *Alabama*, in conjunction with the greater coolness and sharper aim of the former's crew."

"The French, at Cherbourg, were by no means dilatory in recognizing the value of these Dahlgren guns. Officers of all grades, naval and military alike, crowded the vessel during her stay at that port, and they were all eyes for the massive pivots and for nothing else. Guns, carriages, and even rammers and sponges, were carefully measured; and if the pieces can be made in France, many months will not elapse before their muzzles will be grinning through the port-holes of French ships of war."

"We have no such gun in Europe as the 11-inch Dahlgren; but it is considered behind the age in America. The 68-pounder is regarded by us as a heavy piece, but in the United States it is the *minimum* for large vessels, where some ships carry the 11-inch gun in broadside. * * * It is considered far too light, however, for the sea-going iron-clads, although throwing a solid shot of 160 pounds; yet it has made a wonderful stir on both sides of the channel. What, then, will be thought of the 15-inch gun throwing a shot of 480 pounds, or of the 200-pound Parrott with its range of five miles?"

Such was the state of American gunnery in 1864. We are, however, but little further advanced than at that time, while England, instead of having no gun in its navy equal to our 11-inch smooth-bore gun of 8 tons, mounts upon her ships of war rifles of 81 tons, throwing shot of nearly a ton's weight, and which can penetrate 22 inches of solid iron armor. Ought America longer hesitate to put her ship-builders, her forges, and her foundries at work? For a nation which proposes to dominate a hemisphere, and to dictate to the great naval powers of Europe non-interference in the affairs of the American republics, the United States is singularly neglectful of the means by which she may make her manifesto effectual.

This tells the story of the state of American gunnery in 1864, and the reason for our present weakness. It is not that our guns are poorer now than then, for we have the same and a few even better than they were.

To-day the *Kearsarge*, the ship which won that great victory, is even a better ship than she was on that day. She carries amidship the two 11-inch Dahlgren guns which are said to have given her the victory over the *Alabama*. She is as able now as then to engage in battle, and in an engagement with another *Alabama* would be as likely now as then to come off victorious. But there will be no more *Alabamas*. The fighting cruisers of all European powers carry guns as superior to hers as were hers superior to those of the *Alabama* at that time. The *Kearsarge* as a fighting ship has won her last victory. Both ship and guns are of a past age. In peace she is useful, and bears the flag which she defended and honored worthily. In war she would stay in port.

CRUISING VESSELS OF WAR.

While I cannot of course find it in my heart to complain of the Committee on Appropriations for what they have done, yet I desire to call the attention of the House to the appropriation they propose for the Department of Construction and Repair. They give the meager sum of \$1,750,000. How is this to be applied? Out of it is to come, according to the bill, first, the cost of materials and stores of all kinds; labor in navy-yards and on foreign stations; preservation of materials; purchase of tools; wear, tear, and repair of vessels afloat; and general care, increase, and protection of the Navy in the line of construction and repair and incidental expenses.

Now, this will cost a large sum, even if the 30 per cent. limitation as to repair of wooden ships is accepted. One million dollars of this appropriation at least will be thus consumed. The balance is all they propose to allow for the commencement of the new navy, now so much needed and so universally desired. What will this balance of \$500,000 or \$700,000 do toward the construction of two great steel ships of war, designed to be the best unarmored cruising ships which float upon the ocean?

But I thank them even for this little. If, however, it is proper and no violation of our sacred rules to make appropriation in this

bill for new ships of this small amount, what prevents that committee, if they really feel as I have no doubt a majority of them do, that a navy is needed and ought now to be built, from generously permitting an amendment to the bill appropriating a sum adequate to the commencement of all the vessels recommended by the Committee on Naval Affairs? I hope at least they will consent to some increase of appropriation for the two cruisers, if they cannot see their way to authorize the commencement of others. We are, of course, not to antagonize the Committee on Appropriations. What they are disposed to do to help the Committee on Naval Affairs to get a hearing in spite of the rules, we ought to accept in good faith and in thankfulness.

But I call attention to the fact that this bill does not guard the appropriation for new ships. I think small as the appropriation is it should be properly guarded. This is the point of beginning and may prove to be the establishment of a new policy in naval administration.

In the bill of the Naval Committee we provide that not one dollar of the appropriation shall be expended under the exclusive direction of the bureaus as they now exist. I have been personally struggling during my long membership of the Committee on Naval Affairs, as I think the former chairman, Mr. WHITTHORNE, will bear witness, to lift the Navy up and beyond the liability of great mistakes and failures, and to take it out of the divided control of these inharmonious bureaus, and to center upon the administration of the construction department a combination of skill and knowledge. I have no fault to find with men or heads of bureaus. I quarrel only with what I believe to be a vicious and expensive system.

In a former bill reported by me for the Committee on Naval Affairs it was proposed to establish a board of assistants for the Navy something on the plan of the old board of admiralty, which was intended to pass upon all designs and plans. The bill which contained that provision has furnished the substance for the two bills reported by the present Committee on Naval Affairs, the one for the construction of new ships, and the other for sale or destruction of the old ones.

BOARD OF ADVICE AND SURVEY.

We have been obliged in this new bill, in compliance with the views of many persons of knowledge and experience in these matters, to adopt another plan and to provide that not one of these great ships of war shall be commenced until the Secretary of the Navy shall designate a board of five officers of the Navy of the highest skill, from the line and the staff, and without reference to rank, and also three experts from civil life, who shall pass upon every plan, and that every single step in the process of construction shall be submitted to them. That is, not that they shall have power to control the Navy, but that they shall advise the head of the Department, shall give him their assistance and counsel, so that he shall not be subject to the danger of following the lead of some naval constructor who may build a good ship without reference to the engines she is to carry, or the blunders of some steam-engineer who may be able to construct splendid engines without reference to the ships they shall propel, or some ordnance officer who may build splendid ordnance without reference to the vessel to be armed with them.

We propose that all the great elements of ships of war shall be considered first by the board before a blow is struck in their construction. I ask this House how better could we guard the Treasury of the Government, and how better could we provide for the constructing of a navy worthy to bear our flag?

I trust the Committee on Appropriations will accept as an amendment to their bill the provisions for guarding their appropriations substantially as found in the bill of the Committee on Naval Affairs, No. 5001.

Under the rules of the House we to-day here have the privilege of advocating so much of this appropriation bill as will barely begin the work, and in my judgment in a very unsatisfactory manner.

Mr. ROBESON. Will the gentleman pardon me for interrupting him a moment?

Mr. HARRIS, of Massachusetts. Certainly.

Mr. ROBESON. Perhaps I misunderstood the gentleman, but I thought he said that this bill gave only \$750,000 for the construction and repair of the Navy.

Mr. HARRIS, of Massachusetts. I said it gave \$1,750,000.

Mr. ROBESON. It gives \$1,750,000 to the Bureau of Construction.

Mr. HARRIS, of Massachusetts. That is what I said.

Mr. ROBESON. And limits the amount to be expended on the repairs of old wooden ships to \$400,000.

Mr. McLANE. That is what the gentleman from Massachusetts said.

Mr. ROBESON. That will leave \$1,350,000 available for new ships.

Mr. HARRIS, of Massachusetts. I do not think that is a fair statement of it.

Mr. ROBESON. I so understand it; I speak of the Bureau of Construction. The sum of \$1,750,000 is appropriated for the Bureau of Construction, \$400,000 of which only may be expended on the repairs of old wooden ships. The remainder will be applicable to building the ships as recommended by the Committee on Naval Affairs.

Mr. HEWITT, of New York. How about the other iron-clads? How are they to be provided for?

Mr. ROBESON. They are provided for in a different portion of the bill.

Mr. HARRIS, of Massachusetts. The gentleman and I do not differ. I stated that the amount given for construction was \$1,750,000; and I said that from this you must first take enough to make your purchases for that department, which ordinarily cost \$500,000 a year; that then \$400,000 would be required for the repair of old wooden ships, leaving the balance of the appropriation applicable to the commencement of work on the two great ships of war. I believe that this House if it could fairly and fully consider all that we as members of the Naval Committee have considered, would consent to increase this appropriation largely and put upon it the limitations which we have recommended in regard to the expenditure of the money.

The Committee on Appropriations have allowed \$100,000 for guns. I thank them for so much; but that \$100,000 in the hands of the Ordnance Bureau will not produce two 6-inch rifles, manufactured as they are to be in our works. Why, sir, in order to commence this great work we must either encourage the great iron founders, the gun-makers of the country, by giving them contracts, or we ought to begin at once the work of building for our own use a foundry for the manufacture of steel guns. Let me say (for I wish to conceal nothing) that when you enter upon the work of building up a navy you must spend some money; and you might as well meet the issue now as at any other time. The first thing to be done, if you are going to commence the construction of heavy steel guns after the European plan, is to build a 100-ton hammer. We can produce the steel here; there is no trouble about that; but when we have the steel ingots we must have a hammer equal to that used in Europe; this hammer will cost probably a million dollars.

THE NAVAL APPROPRIATION BILL.

Mr. Chairman, there is other new legislation in this bill to which I wish briefly to refer. Some of it has been under consideration in the Committee on Naval Affairs; the greater part of it has not been. Therefore I cannot, as a member or as chairman of the Naval Committee, as representing the committee, indorse all these provisions. While I am inclined to believe that the provision concerning the Naval Academy, cutting down at the bottom is wise, I am not prepared to cut off at the top. I am not quite content to say that officers of the Navy holding the rank of captain, ten of whom have been in the service since 1841, officers who went through our late war, many of them winning distinction, shall now, just as they are about to become commodores, be compelled to retire as captains.

I do not think it just that officers who have been promoted for gallantry should be retired at a lower grade just as they have reached the point of promotion. The Admiral and Vice-Admiral are to be retired. It is said that those officers who have received honorable mention by Congress shall retire with their full pay until they have been fifty-five years in the service. Now, the Admiral entered the service in 1829; he has been in it fifty-three years. He has three times received the thanks of Congress. He has won victories for the country of which every American is proud. No vote of mine shall ever strike at him. No vote of mine shall ever take from him a single honor or diminish in his declining years any of the privileges which the country has bestowed upon him. Nor shall my vote be given to take from that other brave and distinguished officer, Vice-Admiral Rowan, either the honors or the pay which he so worthily enjoys. They served their country in war. I did not. Mine is not the vote to be cast for their dishonor.

SALE OF OLD AND WORTHLESS VESSELS AND MATERIAL.

In conclusion I cannot fail to express my satisfaction at the prospect that the bill before us provides for the final condemnation and sale or removal of worthless vessels of the Navy. The Committee Appropriations have adopted as a part of this bill, being all of the second section, all the essential and important provisions of the bill reported from the Committee on Naval Affairs, now No. 6 on the Calendar of the Whole House on the state of the Union, entitled "A bill to provide a permanent construction fund for the Navy, and for other purposes." That portion establishing a permanent construction fund from the proceeds of the sale of old material and old vessels, and from appropriations therefor, is omitted, but I do not much object on that account. The main and great purpose of that measure was to compel the sale of condemned materials and ships, and save the great annual cost of their care and preservation. And it is a matter of small moment whether the net proceeds go directly into the Treasury as a part of the public money or into a construction fund. In either case Congress could do with it just as it should see fit. If any considerable amount should be realized it might make Congress feel more liberal in its appropriations for the Navy. It is a measure of real economy, as I will show.

In report No. 139 the Committee on Naval Affairs give three lists of old vessels supposed to be useless and which they believe should be sold or broken up. Those lists, with the comments of the committee upon them, are as follows:

The following is a list of eight ships, with their tonnage, displacement, proposed number of guns, age, and location, which are unfinished on the stocks in the several navy-yards, rotten and utterly worthless, and which must be torn down where they stand because they cannot be floated, and probably could not be sold to be

removed. The old timber which they contain has little or no value, and it is doubtful whether the metal contained therein is worth the cost of removal.

Name.	Age.	Guns.	Tonnage.	Displacement.	Location.
Connecticut.....	1867	21	2,869	4,450	Boston navy-yard.
Pennsylvania.....	1867	22	2,490	4,000	Do.
Java.....	1867	21	2,490	4,000	New York navy-yard.
Colossus.....	1867	4	2,127	Do.
Massachusetts.....	1867	4	2,127	Portsmouth, N. H.
Oregon.....	1867	4	2,127	Boston navy-yard.
Virginia.....	1818	2,600	4,150	Boston, partly cut down.
New Orleans.....	1818	4,150	Sackett's Harbor.

These vessels cannot be destroyed without a large expenditure of money, and the old material which they contain will be the only remuneration the Government will secure from their destruction. The Government has now on hand too much old material which it cannot use and which should be sold. The bill provides that the cost of the destruction and removal of these vessels may be paid out of the construction fund, and that the proceeds of the sales of such old material as is not fit for further use shall be paid into such fund.

Another list, of 24 vessels, is here presented, which includes only worn out and worthless vessels, which can be of no further use as vessels of war. They are given in classes, as they stand in the Register.

STEAM-VESSELS.

Name.	Age.	Guns.	Tonnage.	Displacement.	Location.
FIRST RATE.					
Niagara.....	1855	12	2,958	5,440	Boston navy-yard.
Florida.....	1864	12	2,135	4,220	New London navy-yard.
SECOND RATE.					
Susquehanna.....	1850	23	2,213	3,960	New York navy-yard.
Congress.....	1867	16	2,000	3,050	Portsmouth, N. H., navy-yard.
Worcester.....	1867	13	2,000	3,150	Norfolk navy-yard.
Benicia.....	1867	12	1,122	2,400	Mare Island navy-yard.
Canandaigua.....	1862	9	955	2,130	Norfolk navy-yard.
Monongahela.....	1862	9	960	2,100	Mare Island navy-yard.
THIRD RATE.					
Narragansett.....	1858	5	506	1,235	Mare Island navy-yard.
Kansas.....	1863	3	410	900	Portsmouth, N. H., navy-yard.
Saco.....	1863	3	410	900	Mare Island navy-yard.
Nyack.....	1863	3	410	900	Do.
Shawmut.....	1863	3	410	900	Norfolk navy-yard.
FOURTH RATE.					
Frolic (purchased)...	1864	8	614	1,300	Washington, D. C., navy-yard.

SAILING-VESSELS.

Name.	Age.	Guns.	Tonnage.	Displacement.	Location.
Ohio.....	1820	5	2,700	4,250	Boston navy-yard.
Constitution.....	{ 1797 and 1876 }	6	1,335	2,200	League Island navy-yard.
Sabine.....	1855	22	1,475	2,450	Portsmouth, N. H., navy-yard.
Savannah.....	1842	1,475	2,330	Norfolk navy-yard.
Cyane.....	1837	2	695	950	Mare Island navy-yard.
Guard (purchased)...	2	925	Portsmouth, N. H., navy-yard.
Relief.....	1836	2	468	Washington, D. C., navy-yard.
Supply.....	1846	2	547	League Island navy-yard.
Dictator.....	2	1,750	4,500	Do.
Roanoke.....	6	2,260	Chester, Pa.

It may be that some of these ships are worth retaining, but I venture to predict that for every one on this list worthy of being retained there will be found two from the list of so-called able ships which should be added to it.

I have not the means of showing how much money these vessels have cost for their care and preservation since they ceased to be of any service. But I can give the cost of a few of them.

The following is a list of vessels, with the date of their last cruise and the cost of their maintenance, care, and preservation since that time:

Name.	Last cruise.	Cost.
Niagara.....	1865	\$98,805 15
Florida.....	1868	67,557 00
Susquehanna.....	1868	34,338 64
Narragansett.....	1875	9,664 00
Congress.....	1874	12,810 51
Kansas.....	1875	14,443 00
Canandaigua.....	1875	20,067 00

From these figures it may be seen that the provisions of the bill concerning their sale are wise and expedient, and will result in substantial saving to the Government.

Taking advantage of the privilege granted by the House, I will annex in form of an appendix extracts from the report of the Committee on Naval Affairs, and several papers of interest to persons seeking information in relation to the Navy.

APPENDIX A.

The Naval Register last issued brings official information concerning the Navy down to January 1, 1882. The list of 140 vessels there given is made up of the following classes:

Steam-vessels:	
First-rates.....	13
Second-rates.....	20
Third-rates.....	27
Fourth-rates, including two torpedo-boats.....	8

Total Sailing-vessels:	68
Second-rates.....	4
Third-rates, first-class.....	6
Third-rates, second-class.....	6
Fourth-rates.....	5

Total Iron-clads.....	23
Tugs.....	25

Total number of vessels of all classes..... 140

On the 10th day of January last this committee made a report (No. 139) to the House on the subject of the bill H. R. No. 677, entitled "A bill to provide a permanent construction fund for the Navy, and for other purposes," in which they give a list of eight steam-vessels which are unfinished on the stocks in the navy-yards, rotten and utterly worthless. That list is as follows:

Name.	Age.	Guns.	Tonnage.	Displacement.	Location.
Connecticut.....	1867	21	2,869	4,450	Boston navy-yard.
Pennsylvania.....	1867	22	2,490	4,000	Do.
Java.....	1867	21	2,490	4,000	New York navy-yard.
Colossus.....	1867	4	2,127	Do.
Massachusetts.....	1867	4	2,127	Portsmouth, N. H.
Oregon.....	1867	4	2,127	Boston navy-yard.
Virginia.....	1818	2,600	4,150	Boston, partly cut down.
New Orleans.....	1818	4,150	Sackett's Harbor.

Another list is given of fourteen vessels, which includes only worn-out, obsolete, and worthless vessels, which it would be shameless folly and unpardonable extravagance to attempt to repair, having no possible present or prospective use, and which cost annually a considerable sum to guard and save from depredation by harbor thieves. That list is appended:

STEAM-VESSELS.

Names.	Age.	Guns.	Tonnage.	Displacement.	Location.
FIRST RATE.					
Niagara.....	1855	12	2,958	5,540	Boston navy-yard.
Florida.....	1864	12	2,135	4,220	New London navy-yard.
SECOND RATE.					
Susquehanna.....	1850	23	2,213	3,960	New York navy-yard.
Congress.....	1867	16	2,000	3,050	Portsmouth, N. H., navy-yard.
Worcester.....	1867	13	2,000	3,150	Norfolk navy-yard.
Benicia.....	1867	12	1,122	2,400	Mare Island navy-yard.
Canandaigua.....	1862	9	955	2,130	Norfolk navy-yard.
Monongahela.....	1862	9	960	2,100	Mare Island navy-yard.
THIRD RATE.					
Narragansett.....	1858	5	506	1,235	Mare Island navy-yard.
Kansas.....	1863	3	410	900	Portsmouth, N. H., navy-yard.
Saco.....	1863	3	410	900	Mare Island navy-yard.
Nyack.....	1863	3	410	900	Do.
Shawmut.....	1863	3	410	900	Norfolk navy-yard.
FOURTH RATE.					
Frolic (purchased).....	1864	8	614	1,300	Washington, D. C., navy-yard.

Still another list is given, which includes eight old sailing-ships and two iron-clads, all of which, with perhaps the exception of the iron-clad Dictator, are utterly worthless for naval purposes and wholly unworthy of repair. That list is as follows:

SAILING-VESSELS.

Name.	Age.	Guns.	Tonnage.	Displacement.	Location.
Ohio.....	1820	5	2,700	4,250	Boston navy-yard.
Constitution.....	{ 1797 and 1876 }	6	1,335	2,200	League Island navy-yard.
Sabine.....	1855	22	1,475	2,450	Portsmouth, N. H., navy-yard.
Savannah.....	1842	1,475	2,330	Norfolk navy-yard.
Cyane.....	1837	2	695	950	Mare Island navy-yard.
Guard (purchased).....	2	925	Portsmouth, N. H., navy-yard.
Relief.....	1836	2	468	Washington, D. C., navy-yard.
Supply.....	1846	2	547	League Island navy-yard.
Dictator.....	2	1,750	4,500	Do.
Roanoke.....	6	2,260	Chester, Pa.

Of the twenty-five "tugs, &c.," borne on the Naval Register, the committee estimate that at least ten are worn out and useless, and which should be sold or demolished. If the committee are correct in their estimate, here are forty-two, out of one hundred and forty vessels of all classes, whose names appear as part of the "Navy of the United States," representing not only no naval power whatever, but which can hereafter serve no useful purpose, and which are, moreover, a constant drain on the appropriations for the support of the Navy, and a consequent loss to the Government to the extent of the cost of their protection, which aggregates annually no small sum.

As an illustration, we may take the case of the Niagara, at Boston, which has been tied up to her dock, a worthless hulk, since the attempt to repair her, nearly or quite eighteen years ago, was abandoned. She has cost for her care alone since that time more than \$98,000, and it is doubtful if she is worth to-day, or will bring, \$25,000 at auction.

Other instances of the same kind are numerous, and the statistics on that subject are in preparation and will be laid before Congress. We regret that we are unable to present them in this report for want of time for their completion. From the list of one hundred and forty vessels whose names are borne on the Register, forty-two thus fall out at once, without question or doubt, and we are left with a total Navy of only ninety-eight vessels of all classes. But this does not, by any means, tell the story of our naval weakness, for of these ninety-eight fifteen are but navy-yard tugs, which are not serviceable for war purposes. We therefore treat them as tools, useful in navy-yards and naval stations, as are other tools and machines, as a part of the plant, rather than as vessels of the Navy, and we strike them out of the ninety-eight, leaving only eighty-three as the total number of our vessels of the Navy capable of service.

But our humiliation is not yet complete. Of these eighty-three fourteen are old sailing-vessels of a bygone age, and of an outgrown and abandoned system. We give their names, ages, tonnage, guns, and their present location and use:

Name.	When built.	No. of guns.	Tonnage.	Displacement.	Location and use.
New Hampshire	1818	15	2,600	4,150	Repairing at Norfolk for training-ship for boys.
Vermont	1848	19	2,400	4,150	Receiving-ship at New York.
Constellation	1797 and 1854	10	1,236	1,886	Practice-ship at Naval Academy.
Independence	1814	22	1,891	3,270	Receiving-ship at Mare Island, California.
Santee	1855	48	1,475	2,430	Gunnery ship at Naval Academy, Annapolis, Md.
Portsmouth	1843	12	846	1,125	Apprentice training-ship.
Jamestown	1844	12	888	1,150	Fitting for apprentice training-ship.
Saratoga	1843	12	757	1,025	Training-ship at Washington; a hulk.
Saint Louis	1828	431	830	Receiving-ship at League Island, Pa.
Saint Mary's	1844	8	766	1,025	Public Marine School, New York. Lent to that State.
Dale	1839	8	320	675	Practice-ship at Naval Academy, Annapolis, Md.
Pawnee	1858	872	1,650	Store-ship at Port Royal.
Onward	3	704	Store-ship at Callao, Peru.
Freda	Mare Island, Cal.

* Purchased.

By deducting these our list falls from eighty-three to sixty-nine. These sixty-nine include steam-vessels only and were intended for war purposes. This number must be again reduced by withdrawing the name of the Arctic ship Rogers, which was purchased for and sent out on the humane mission of rescuing lost Arctic explorers, and the names of four double-turreted iron-clad monitors, now on the stocks in the private yards of contractors at Wilmington, Chester, Philadelphia, and Mare Island, with the question of their fate still undecided, namely, Amphitrite, Puritan, Terror, and Monadnock; and also the name of the Miantonomoh, now afloat at League Island, Pennsylvania, new and in perfect condition and ready for sea; except that having neither turrets nor guns she has no excuse for going to sea. With this reduction our list falls to sixty-three. But if we seek our present real naval power for active service at sea we must continue this dissolving view. The following table gives the names, ages, displacement, tonnage, guns, and present use of several steam-vessels of the Navy, some of which are not in present condition for service, some of which can never be made so, and all of which are of very doubtful value to the service:

Name.	When built.	Guns.	Tonnage.	Displacement.	Present location, condition, and use.
Franklin	1854	39	3,173	5,170	Receiving-ship at Norfolk.
Colorado	1855	46	3,032	4,700	Receiving-ship at New York.
Minnesota	1855	46	3,000	4,700	Training-ship at Newport, Rhode Island.
Wabash	1854	45	3,000	4,650	Receiving-ship at Boston.
New York	1865	21	2,490	4,070	A frame on the stocks at New York; live oak; worthy of being finished.
Iowa	1865	26	2,019	4,000	Probably worthless; at Boston; machinery taken out; white oak; built at close of the war; very fast; did no service.
Aniaketam	1865	21	2,490	4,000	A mere hulk; at League Island; white oak; launched in 1874; used as store-ship and marine barracks; no machinery on board.
Michigan	1844	8	450	685	Iron paddle-wheel lake boat at Erie, Pa.; should give place to a vessel of war to fill treaty rights of United States.
Tallapoosa	1863 and 1874	2	650	1,270	A transport used by Navy Department; lately repaired; a good vessel and useful to the Government in this service.

Names, ages, displacement, tonnage, &c.—Continued.

Name.	When built.	Guns.	Tonnage.	Displacement.	Present location, condition, and use.
Dispatch	Purchased.	4	730	A mere dispatch vessel; a purchased pleasure yacht; fast, and useful to the Government in this service.
Intrepid	1870	311	800	Built for torpedo service; strong and able, but too slow; could be made useful if completed; no torpedo machinery on board.

It is manifest that these vessels can be of little if any practical service in actual war, and we deduct them from our list, which reduces the Navy to fifty-two. But of this reduced number fourteen are of the single-turreted monitor class, not suited for cruising service, and only to be relied upon for coast and harbor defense. They are good vessels of their class, have been rebuilt of iron, or rather have had their old wooden beams replaced with iron since the war. Whether good or bad, they are all we have in the nature of iron-clad harbor defenders afloat and armed, and yet there is not one breech-loading rifled gun of any size in the entire fleet. They are all armed with smooth-bore guns of large caliber, but of small power and short range. They did good service during the war in a contest with an enemy which had no navy. Some of them bear the scars of war, and are objects of respect and veneration, but it is unsafe longer to rely on them as our sole defense against the powerful navies of modern times. They are all classed as fourth-rates, and are as follows, with their guns, tonnage, &c.:

Name.	When built.	Guns.	Tonnage.	Displacement.	Location.
Ajax	1865	2	550	2,100	City Point, James River.
Canonicus	1864	550	2,100	Navy-yard, Pensacola.
Camanche	1865	496	1,875	In ordinary, Mare Island, Cal.
Catskill	1863	496	1,875	City Point.
Jason	1863	496	1,875	League Island, Pennsylvania.
Lehigh	1866	496	1,875	City Point.
Mahopac	1864	550	2,100	Do.
Manhattan	1864	550	2,100	Do.
Montauk	1863	496	1,875	In commission, Washington.
Nahant	1863	496	1,875	League Island.
Nantucket	1863	496	1,875	Annapolis, Maryland.
Passaic	1862	946	1,875	Receiving-ship, Washington.
Saugus	1864	550	2,100	Laid up at Washington.
Wyandotte	1866	2	550	2,100	In commission, Washington.

We have now left to account for only thirty-eight vessels, and in this number is to be found all the naval power for ocean service of the United States.

We annex a table of these thirty-eight vessels, their ages, tonnage, displacement, and guns, their present service, or location, if out of active service. We give them by classes as they stand in the register:

Name.	When built.	Tonnage.	Displacement.	Number of guns.	Kind of guns.	Service.
FIRST RATE.						
Tennessee	1863	2,840	4,840	21	18 s. b., *3 rifle.	Flag-ship, North Atlantic squadron.
SECOND RATE.						
Powhatan	1850	2,182	3,980	16	14 s. b., 2 rifle.	Paddle-wheel, on special duty.
Trenton	1876	2,300	3,800	11	11 8-inch rifle.	Out of commission at New York.
Lancaster	1858	2,120	3,250	20	20 s. b.	Lately repaired, European station.
Brooklyn	1858	2,000	3,000	18	16 s. b., 2 rifle.	Flag-ship, South Atlantic station, en route.
Pensacola	1858	2,000	3,000	22	20 s. b., 2 rifle.	Flag-ship, Pacific station.
Hartford	1858	2,000	2,900	16	Rebuilding at Boston, to have rifled 8-inch converted.
Richmond	1858	2,000	2,700	14	12 s. b., 2 rifle.	Flag-ship, Asiatic squadron.
Alaska	1867	1,122	2,400	12	10 s. b., 2 rifle.	Pacific station.
Omaha	1869	1,122	2,400	12	12 s. b.	Repairing at Portsmouth, N. H.
Plymouth	1867	1,122	2,400	12	12 s. b.	Repairing at Portsmouth, N. H.
Lackawanna	1862	1,026	2,220	9	6 s. b., 3 rifle.	Pacific station.
Ticonderoga	1862	1,019	2,220	9	6 s. b., 3 rifle.	Lately returned to New York.
Vandalia	1874	981	2,080	8	7 s. b., 1 rifle.	North Atlantic squadron.
Shenandoah	1862	929	2,100	9	6 s. b., 3 rifle.	Flag-ship, South Atlantic squadron.
THIRD RATE.						
Juniata	1862	828	1,900	8	7 s. b., 1 rifle.	Repairing at New York, nearly complete.
Ossipee	1861	828	1,900	8	8 s. b.	Repairing at League Island.
Quinnebaug	1866	910	1,900	8	6 s. b., 2 rifle.	European station.
Swatara	1865	910	1,900	8	7 s. b., 1 rifle.	Asiatic squadron.
Marion	1874	910	1,900	8	7 s. b., 1 rifle.	South Atlantic squadron.

Names, ages, displacement, and tonnage, &c.—Continued.

Name.	When built.	Tonnage.	Displacement.	Number of guns.	Kind of guns.	Service.
Mohican.....	1858	910	1,900	8	7 s. b., 1 rifle.	Repairing at Mare Island, California.

FOURTH RATE.						
Alarm.....	1873	311	1,550	1	1 s. b., 15-inch	In commission at Washington.

* s. b., smooth-bore.

It may seem useless to further point out the weakness of our Navy, but it is best that the whole truth be known now, so that we who have the responsibility for the future peace and safety of the country upon us may have the perils and dangers of neglect of present duty clearly before us. A careful examination of the last table, in which is displayed the whole of our offensive naval power, will satisfy any person that many of the vessels there named are old and nearly worn out, slow in speed, feeble in offensive power, and utterly deficient in defensive power, even in the power of running away from danger, and which, when war comes, will only be safe behind fortifications or unapproachable harbors.

The Powhatan will serve as an illustration. She is our second ship in size in active service and is at the head of our list of second-rates. She was built in 1850, more than thirty years ago, and is propelled when under steam by the paddle-wheel, which is now seldom seen at sea. She is little more than a sailing vessel with auxiliary steam-power. She could not fight with the smallest vessel of our Navy. The little torpedo-boat Alarm, with her one smooth-bore fifteen-inch gun and more rapid speed and her wonderful capacity of so maneuvering as always to keep her sharp defective armored prow and great gun to the front, would be an antagonist with which the Powhatan would never successfully engage. And if, in addition to her gun, the Alarm would bring her bow torpedo into play, in a contest with the Powhatan, the trial would end in a few minutes by the sinking of that first of our second-rate vessels of war.

The Omaha, the Plymouth, the Osage, and other of our vessels are now out of active service, awaiting destruction or repair as future necessity or policy shall determine, and it is extremely doubtful whether a wise economy does not dictate their abandonment as vessels of war. The Lancaster has lately been rebuilt at enormous cost, and we cannot but entertain a doubt whether every dollar spent upon her has not been wasted. She is really a new ship, and in many respects better than she was at first, but she is a new ship on an old and outgrown model, and possessed of but few of the qualities required in modern cruising vessels of war. It is often said of her that she is a fine ship in times of peace.

But we have little respect for a ship of war which is only good in times of peace. Profound respect is paid to that ship in times of peace or war which is ready for war, and such vessels, and such only, few in numbers though they may be, are those which this country can afford to maintain. One such vessel is worth a whole navy of obsolesces. The Hartford is undergoing the same process at large cost and will soon be completed, but when finished and afloat she will be only a new ship on an old plan, as good as before and no better. The progress of an age has been made—an age of startling development in war and the arts of naval architecture—since she was conceived and brought into being. When she first took the sea and proudly bore her flag she was the equal in speed and in offensive and defensive power of any vessel of her class in the world. When she achieved her victories and won glory for herself and immortal fame for her great commander, she was but five years old and as good as any vessel of her class afloat. She was built of wood, and so were most of the war ships of her time.

Other vessels have, within a few years, been brought back from "rotten row" into the service in the same way at great cost. The process may go on indefinitely unless a different and wiser policy is now established.

Had the money which has thus been expended (and properly expended in the absence of authority of Congress to make wiser use of it, perhaps) been applied to the completion and armanent of our double-turreted iron-clad monitors we should not now be, as we confessedly are, helpless to defend our own shores and great commercial centers against the attack of the smallest nation of the earth, which may have had the courage and the wisdom to buy and to fit out a modern iron-clad vessel of war effectively armed.

The double-turreted iron-clad monitor, Monadnock, is now on the stocks in the private ship-yard of Mr. Burgess, at Vallejo, California, half finished. She was intended to be a defense for the city of San Francisco and the west coast. The money which has been expended in rebuilding obsolesces of wood since work on the Monadnock was suspended would have finished and armed that vessel with the most powerful guns of modern times, and San Francisco, the great center of our Pacific commerce, would be in no danger from any enemy. We are not probably in danger of falling into new difficulty with Chili; but that people have just passed through a great war with Peru. They are flushed with victory. They may, like other nations under similar circumstances, feel able to resent supposed insults, and may treat gentle expostulation as intended threat. War generally comes without sufficient cause and with short notice. Should Chili find cause to make war on us she would have it all her own way from the start, and in one day

would inflict greater injury upon our people than the cost of fifty Monadnocks could repay. Chili has three European-built iron-clads in her navy, namely:

Name of vessel.	Thickness of armor, in inches.	Displacement, in tons.	Speed, in knots.	Number and description of guns.	Remarks.
Almirante Cochrane..	4½ to 9	3,500	12.8	6 9-inch 12½-ton guns.	Full sail-power.
Blanco Encalada.....	4½ to 9	3,500	12.8do.....	Do.
Huascar.....	4½ to 5½	1,100	11	2 300-pdrs., 4 40-pdrs.	Captured from Peru.

The United States naval force on this—the South Pacific station—consists of four unarmored wooden vessels, namely, Pensacola, (flagship), Alaska, Lackawanna, and Adams. The Pensacola can make eight knots per hour; the Alaska, eleven knots; the Lackawanna, eight knots; and the Adams, eleven knots. Not one of these vessels could either overtake or run away from the Almirante Cochrane or the Blanco Encalada. The entire squadron is not of sufficient force to compete successfully with even one of these two iron-clads, and not of sufficient speed to avoid a hopeless conflict.

It is manifest that in a conflict with this small nation the United States would be helpless to resist the first attack, the most important thing to do in war always, and Chili could levy tribute on the city of San Francisco or seal up the Golden Gate as with an iron wall.

GUNS.

It is not in ships alone that we are weak. The guns on the single-turreted monitors are all smooth-bore muzzle-loaders. There are in the armament of the thirty-eight cruising vessels shown in the table three hundred and eighty-six guns of all classes.

We may not be entirely accurate in this statement, and we have again to regret the absence of official information in the course of preparation. But it is manifest that our Navy is sadly deficient in guns, and that we have not one high-power long-range rifled breech-loading cannon afloat in the Navy, and it may as well be said here that we have not one to put afloat.

It is perhaps not to be regretted that we have not spent large sums of money in the manufacture of guns since the close of the war, for we have doubtless escaped many expensive blunders thereby. The time has not been wholly lost. Our manufactures have been developed during that period to a degree quite unprecedented in our own history. At the close of our war there was not a pound of steel made in this country fit for the fabrication of cannon. To-day our manufacturers can produce steel of the best quality for that purpose in very large quantities, and with their present plant can supply over 150,000 tons a year for that purpose, besides supplying the present demand for steel for all other purposes. The steel made in this country is better than that made in Europe. In six months' time, if we were called upon for it, we could furnish all the steel which the gun-makers of the world could use.

Such is the Navy of the United States. The defense of our harbors and the great centers of our commerce is found in fourteen light-draught monitors, armed with twenty-eight smooth-bore muzzle-loading guns, and one experimental torpedo-boat with one gun.

Our naval power on the ocean is represented by thirty-eight cruising vessels of all classes, carrying three hundred and fifty-seven guns of all calibers, none of which are of high power or breech-loaders, and only sixty-two of which are rifled.

In order to enable this House and the country to compare our Navy with the navies of other countries we here insert tables of the English navy, compiled from official records at the Navy Department, and a few leaves from a pamphlet lately prepared at the Navy Department. The pamphlet does not pretend to absolute accuracy, but is probably sufficiently accurate for all practical purposes and for mere comparison. The contrast may be humiliating, but it will prove useful and result to our advantage.

We here take leave of this branch of the subject with no further comment; argument would seem to be quite out of place.

The unarmored fleet consists of 3 frigates, 9 corvettes, and 12 gunboats.

APPENDIX B.

DOUBLE-TURRET IRON-CLAD MONITORS.—MEMORANDA.

The original monitors, Miantonomoh, Terror, Amphitrite, and Monadnock, were hurriedly constructed during the latter part of the war, of perishable white oak. They have been rebuilt, in conformity with strict specifications and under watchful superintendence, of the best quality of iron. They have double bottoms, water-tight bulkheads, and water-tight coal bunkers, subdivided into compartments so as to insure the flotation of the vessel even if one or more compartments be flooded. In case of an injury to the outer hull, each vessel has an inner skin, strongly bracketed to the hull, which would keep the ship afloat. The inner and outer hulls are sufficiently far apart to admit of their being painted and examined when necessary, and no estimate can be made of the life-time of the vessels under proper care.

The white-oak hulls of the original vessels commenced to rot so soon that shortly after the return of the Miantonomoh from Europe and the arrival of the Monadnock in California, they were found to be beyond repair, and they remained in this rotting condition until they were finally broken up. When stripped of armor and machinery, these old hulls were sold in every case for less than \$10,000, and were burned for the iron bolts in them.

The Terror saw but little service, while the Amphitrite, from error in her design, was unable to float her battery and armor with safety, and was kept for a time anchored off the Naval Academy at Annapolis.

That properly constructed vessels of this kind were able to make long voyages was demonstrated by the European cruise of one and the voyage of another from Philadelphia to San Francisco. It is a matter of record that they made long voyages without requiring assistance from other vessels accompanying them, and that they were perfectly safe and easy in gales that their convoys struggled through. In one case, the convoy became disabled and was towed into port by the monitor, and in another, one of the monitors continued on her course through a gale and reached her destination, while her convoy sought shelter in a convenient port.

In the original vessels the side armor consisted of five plates only, each about 1½-inch thick, making an armor of less than 5 inches of laminated plate iron; that proposed for these new vessels, and now actually fitted to the Miantonomoh, is 7 inches thick of solid rolled iron plates, and with steel faces (compound armor) would have over 100 per cent. greater resistance to projectiles than the original armor.

Powerful rams have added their destructive effect to the strength of the armor, making them in this, as in all other respects, superior to the original design.

The Miantonomoh, which is finished in every detail except her turrets and guns, establishes the capacity for carrying this weight at sea, for her draught of water is known, and she has more than sufficient displacement for the heaviest class of turrets and guns, with her coal and sea stores, leaving her more than the estimated free-board for sea service.

The Terror, Amphitrite, and Monadnock are vessels of similar weights and dimensions, and by the substitution of steel-faced or deflecting armor, as lately invented, their power of resisting shot could be increased so as to equal that of an 11-inch side armor of rolled iron, and there is no doubt of their having sufficient displacement not only for this purpose, but for the additional weight of heavier deck plating, and with this they could carry for an extended cruise a full complement of coals, stores, outfits, &c., including also a steam torpedo boat. With a reduction of coal, &c., to that necessary for a limited time only, as for harbor defense, their armor could be greatly increased.

The turrets of the original vessels were composed of ten plates, each 1½-inch thick, re-enforced at base by a solid ring, while those of the present vessels are proposed to be of solid iron plates (and by a later report recommended to have steel facing) 12 inches thick, more than doubling their resistance to projectiles.

The pilot-houses designed for the new vessels will, like the turrets, be of solid rolled plates, affording more perfect protection to the commander, and by means of the new arrangement for steering the ships by steam, he will, from the pilot-house, control the movements of the vessel with ease and precision.

The new method for lifting the turrets by means of a hydraulic hoist in addition to the ordinary key has removed difficulties which were continually experienced under the old arrangement. They are also protected in regard to free revolution by a solid deflecting plate secured to the deck around the foot of each turret.

The ventilation of the new vessels is a great improvement upon that of the old, and on the Miantonomoh the apparatus for this purpose has been completed. Additional blowers of improved form and capacity have been fitted so as to insure a full supply of air to all parts of the engine and fire-rooms, while, at the same time, exhausting the heated and impure air from all parts of the vessel.

The machinery for turning the turrets has been greatly increased in power, so as to be sufficient for revolving the largest turrets containing the heaviest guns, and, by its new arrangement, is so fitted that the breakage of any part of its gear does not disable the machinery, for a duplicate on the other side will insure the revolution of the turret.

Engines of improved design, on the compound principle, of increased power, and occupying less space, have been substituted for the machinery of the original vessels, and high-pressure boilers for all the vessels have been finished and are ready to go on board. The adoption of twin screws for these vessels makes it possible for them to be turned with facility, and the disarrangement of one engine does not affect the working of the other. The entire machinery of the Miantonomoh is completed in all details, and has been tested under steam and accepted after a most satisfactory performance. The speed of the new vessels will be at least one-fourth greater than that of the old ones, and they will steam at a rate of twelve knots.

The arrangement for pumping from any or all of the compartments into which the new vessels are divided has been made from the most approved plans, and powerful direct-acting steam wrecking-pumps have been designed so as to give the greatest possible pumping-power in case of any accident. In each vessel passage-ways have been provided and extend fore and aft on each side, so as to make the armor-bolts and backing accessible, and large coal-bunkers protect the engines and boilers throughout their whole length.

In the case of the Puritan the improvement over the old vessel is even more distinctly marked. Originally the hull was built of iron with a single bottom, while the present vessel has a double hull with water-tight compartments and bunkers, and is constructed on the longitudinal and bracket system of the strongest form, and similar to that of the best and most recent foreign iron-clads. In the old Puritan the boilers and engines extended to the very hull-plates, but the present vessel has coal on each side of the machinery. Recent experiments have shown this to be a most effective protection against projectiles. The armor of the original vessels projected over the side, forming a most dangerous overhang, but in all the new designs the armor is flush with the side, and by increased displacement again of over three feet in the Puritan's draught has been effected. As at first designed the Puritan was to carry two turrets, but as the building progressed it was found that one turret only could be fitted; even this was never completed, nor was the hull or machinery ever finished, but by a special act of Congress the vessel in this unfinished state was accepted by the Government after an expenditure of \$2,000,000, (\$1,974,622.93.)

From the record of the Dictator, a similar vessel, and the best and most formidable of all that monitor system up to the time when the present designs for the new monitors were completed, it will be seen that the maximum speed of the original Puritan would never exceed ten knots, (the speed of her sister ship, the Dictator,) and her indicated horse-power would have been 2,000. The new Puritan's engines would develop 3,750 horse-power continuously and very greatly increase the speed, carrying her heavier guns and armor also on a draught of from 3 to 3½ feet less than the original vessel.

In all the above-mentioned vessels the material and workmanship, inspected by various boards, has in every case been pronounced of the very best quality, and their completion recommended.

APPENDIX C.

NAVY DEPARTMENT, BUREAU OF ORDNANCE,
Washington City, May 18, 1882.

SIR: Agreeably to your verbal request, I have the honor to inclose herewith an estimate of the cost for the ordnance outfit of a single-turreted and a double-turreted monitor armed with 10-inch guns; and also the estimate for a monitor armed with 12-inch guns.

I am, sir, your obedient servant,

MONTGOMERY SICARD,
Chief of Bureau.

HON. B. W. HARRIS, M. C.,
United States House of Representatives, Washington, D. C.

Estimate of ordnance outfit for the double-turreted monitors.

Four 10-inch guns, at \$56,000 each.....	\$224,000
Four 10-inch gun-carriages, at \$7,000 each.....	28,000
Four hundred rounds of projectiles, 100,000 pounds, at 10 cents per pound.....	10,000
Four hundred rounds of powder, 80,000 pounds, at 25 cents per pound.....	20,000
Three Hotchkiss revolving cannon and ammunition, (47 millimeters,) at \$4,300 each.....	12,900
Two Gatling guns and carriages, at \$1,430 each.....	2,860
One 3-inch breech-loading howitzer.....	1,126
Magazine small-arms, revolvers, and ammunition.....	4,000
Implements and equipments for working the guns, magazine stores, and miscellaneous equipments.....	7,340
Fuses, primers, &c.....	1,174
One launching tube for torpedoes.....	5,000
Four auto-mobile torpedoes, at \$3,675 each.....	14,700
Three electric search-lights, electric battle-lanterns, dynamo-electric machine, and engines therefor, torpedo defense-nets and appurtenances.....	6,000
	343,700

The Puritan will probably carry 12-inch guns, which, with the ammunition and heavier machine guns and more torpedoes and tubes, would increase this estimate in her case as follows:

Excess on 12-inch guns, (4 guns, 42 tons each).....	\$152,320
Excess on 12-inch gun-carriages, at \$8,000 each.....	4,000
Excess on 12-inch projectiles.....	12,000
Excess on powder.....	15,000
Excess on machine guns, (53 millimeters).....	4,000
Excess on small-arms.....	2,000
Excess on torpedoes, (2 side-tubes and more torpedoes).....	18,000

Total excess.....	207,320
Total for Puritan.....	551,020

BUREAU OF ORDNANCE, May 18, 1882.

Estimate of the ordnance outfit for a single-turreted monitor.

Two 10-inch guns, at \$56,000 each.....	\$112,000
Two 10-inch gun-carriages, at \$7,000 each.....	14,000
Two hundred rounds of projectiles, 80,000 pounds, at 10 cents per pound.....	8,000
Two hundred rounds of powder, 40,000 pounds, at 25 cents per pound.....	10,000
Three Hotchkiss revolving cannon, 37 millimeters, at \$2,080 each.....	6,240
Two Gatling guns and carriages, at \$1,430 each.....	2,860
One 3-inch breech-loading howitzer and carriage.....	1,126
Magazine small arms, revolvers, and ammunition.....	2,500
Implements and equipments for working the guns, magazine stores, miscellaneous articles, fuses, primers, &c.....	8,564
One torpedo launching tube.....	5,000
Two auto-mobile torpedoes, at \$3,675 each.....	7,350
Two electric search-lights, battle-lanterns, and dynamo-electric machine and engine therefor.....	4,000

Total.....	181,640
------------	---------

BUREAU OF ORDNANCE, May 18, 1882.

APPENDIX D.

BUREAU OF ORDNANCE, NAVY DEPARTMENT.

Washington City, April 15, 1882.

SIR: Agreeably to your request I inclose an abstract of tests of English ship-building steel, as established by the admiralty, Lloyd's, and the Liverpool Board of Underwriters.

These bodies have demanded a maximum as well as a minimum tensile standard, but I have omitted the former, as I do not think it desirable; and I perceive that the committee in drawing its bill has also omitted the maximum tensile test, which, indeed, would seem to be useless, only imposing a restraint upon the improvement of the steel by the makers.

I think, however, that the committee has not put the minimum tensile limit quite high enough for full utilization of the superior strength of steel as compared with wrought iron.

The committee's minimum limit is 55,000 pounds tensile and 25 per cent. elongation, and it will be perceived by reference to the inclosed table that all the English minimum tensile limits are higher.

This probably results in their getting steel of higher average strength than we would obtain with our comparatively low limit.

At the same time they place the elongation (before fracture) at 20 per cent. over eight inches length, though it would seem probable that more could be obtained.

Sixty thousand pounds per square inch would seem to be a very good minimum limit with the elongation before fracture "equivalent to 20 per cent. in eight inches."

This would be "mild" steel in every sense, and yet would have strength so much superior to that of wrought iron as to enable the designers of the ships' hulls to reap the full advantage of reduction of weight of hull due to the superior strength of the metal.

I am, sir, your obedient servant,

MONTGOMERY SICARD,

Chief of Bureau.

Hon. B. W. HARRIS,

Chairman Committee on Naval Affairs, House of Representatives.

APPENDIX E.

The English Admiralty, Lloyd's and Liverpool Underwriters' Standard Tests for Steel for Ship-building.

Ships cut lengthwise or crosswise of a plate and also angle of bulb steel must have a minimum ultimate tensile strength, as shown in the table below, and an elongation before fracture corresponding to 20 per cent. in a length of 8 inches.

Table of Tensile Tests.

Length of specimens between the measuring points, 8 inches.

	Minimum tensile strength per square inch.	Minimum elongation before fracture.
	Pounds.	Per cent.
Admiralty.....	58,240	20
Lloyd's.....	60,480	20
Liverpool underwriters.....	62,720	20

In testing for elongation (ductility) the percentage of elongation varies with the length of the specimen, about as follows: steel that will stretch 20 per cent. in a length of 8 inches will stretch 25 per cent. in a length of 6 inches; will stretch 32 per cent. in a length of 4 inches; will stretch 37½ per cent. in a length of 2 inches.

TEMPER TEST.

Strips cut from the plate, angle or bulb steel when heated to a low cherry-red and cooled in water of 82° Fahrenheit, must stand bending double round a curve of which the diameter is not more than three times the thickness of the plates tested. The French Government rules reduce the percentage of elongation required as the thickness of the plates decreases.

APPENDIX F.

NAVY DEPARTMENT, Washington, May 26, 1882.

SIR: I have the honor to inclose to you two communications to the Department from the Chief of the Bureau of Ordnance; the first, recommending the purchase of torpedoes; and the second, the purchase of a torpedo-boat and the working drawings therefor.

The subject is respectfully called to your attention, with the request that the committee will make a special appropriation of \$100,000 for the purchase of torpedoes of the latest construction, and a set of launching apparatus with working drawings therefor, and also an appropriation of \$55,000 for the purchase of a torpedo-boat and the working drawings of the same.

Very respectfully, your obedient servant,

WM. E. CHANDLER,
Secretary of the Navy.

Hon. FRANK HISCOCK,

Chairman of the Committee on Appropriations,
House of Representatives.BUREAU OF ORDNANCE, NAVY DEPARTMENT,
Washington City, May 24, 1882.

SIR: The question of a proper armament of auto-mobile torpedoes for the Navy is a very pressing one, and the point of development at which this torpedo material has arrived is now such as to enable the bureau to make an urgent recommendation of prompt action looking to the acquisition of a suitable number of the best type of this most destructive and necessary agent of warfare.

Of course the bureau need not enlarge upon the necessity that exists for the possession of such a weapon, and therefore it will merely remark that the United States is the only country of any pretension which does not now possess an armament of this description.

Among the various torpedoes of this kind that have been brought forward from time to time the only one that is formally and positively incorporated into the naval armaments of the first-class powers is the type commonly known as the "fish torpedo," and of this there are two sizes—one 19 feet long and 15 inches diameter, the other 14½ feet long and 14½ inches diameter. The former is much the superior, having a working range nearly double that of the smaller one, and an equal speed at equal ranges; it is also considered more accurate in flight.

In order to show the favor with which this weapon has been received and the extent to which it has been introduced into the navies abroad, the bureau subjoins a list of the nations that have adopted it as their principal offensive torpedo armament: Austria, England, Denmark, France, Germany, Spain, Greece, Norway, Sweden, Portugal, Italy, Holland, (probably,) Belgium, Russia, Argentine Confederation, Brazil, China, and Chili, (probably.)

This list is a certain indication of merit, and, bearing in mind that this is the only auto-mobile torpedo used to any extent by the navies of these powers, and that they are vitally interested in the efficiency of their naval armaments, the conclusion is unavoidable that, as far as present appearances go, this type is the one which offers the most advantages for introduction into our navy, and, furthermore, that it must be in such a state of development as to surpass by far all its competitors.

The principal manufacturers of the "fish torpedo" are the Berlin Machine-Building Stock Company, formerly Messrs. Schwartzkopf & Co., of Berlin, Germany, and Messrs. Whitehead & Co., of Fiume, Austria. The latter firm is, however, the only one that makes the larger size, (19 feet long,) which appears to be the most suitable to operate from fast torpedo boats, as its range and accuracy are superior to those of the smaller size, as before remarked.

The 14-foot torpedo would answer very well for use for such ships of war as would not have room enough for the convenient handling of the 19-foot size; but the bureau recommends the purchase of the larger weapon and the subsequent manufacture of the smaller one in this country if found necessary.

(Messrs. Whitehead & Co. furnished certain confidential information which is omitted here in consideration of that fact.)

The bureau however recommends the purchase of twenty-five torpedoes and the working drawings, and one set of launching apparatus, as being on the whole the most prudent arrangement.

If this purchase be made, we shall at once be provided with a partial outfit of torpedoes for immediate use in the defense of our large commercial ports and ships of war.

We can then proceed to the manufacture of more of each size as the needs of the service may require, an opportunity being afforded to improve the type if we are able.

We should of course proceed to the immediate manufacture of a sufficient number of sets of launching apparatus to go with the torpedo that we buy, using the one set purchased as a model and embodying such improvements as may present themselves.

Any contract for these torpedoes must of course specify that each one shall perform to the satisfaction of the Navy Department before acceptance, and in case an order is given to Messrs. Whitehead & Co. they will guarantee the following speeds and maximum deviations at the undermentioned ranges:

Class of torpedo.	Length.	Diameter.	Speed, knots.	Range, in yards.	Extreme deviations.	
					Horizontal.	Vertical.
	Feet.	Inches.			Yds.	Inches.
Whitehead, (bronze).....	19	15½	21	833	±16	±16
Whitehead, (bronze).....	14½	14½	24	433	±9	±16
Whitehead, (bronze).....	14	14	22	600	±10	±16

If it should be decided not to purchase any torpedoes, but only the working drawings, then we should have to commence the manufacture ourselves, doubtless making some failures at first and being without any armament until a suitable number could be finished satisfactorily, which would probably take two or three years.

It is believed that twenty-five Whitehead 19-foot torpedoes of the very latest construction and one set of launching apparatus (with working drawings) can be purchased and brought to the United States for \$100,000, and the bureau recommends that such an appropriation be asked for.

I have the honor to be, very respectfully, your obedient servant,
MONTGOMERY SICARD,
Chief of Bureau.

Hon. WILLIAM E. CHANDLER, *Secretary of the Navy.*

APPENDIX G.
BUREAU OF ORDNANCE, NAVY DEPARTMENT.
Washington City, May 24, 1882.

SIR: Directly connected with the question of the auto-mobile torpedo is that of a suitable type of very swift boat or small vessel from which to launch the weapon against hostile ships that might attempt to blockade our harbors or attempt to force an entrance.

Owing to the introduction of magazine small arms, revolving cannon and improved ordnance generally, the possibility of a torpedo-boat remaining long under fire of an enemy's ship without being struck often is very greatly reduced; and therefore, in order that she may reach a range from which her torpedoes may be launched with reasonable accuracy, she must be either loaded with defensive armor and proceed at moderate speed or else she must be made very light and swift, with the object of remaining as short a time as possible under the enemy's fire.

The latter plan is the one in universal favor for the smaller classes of vessels; and in order to obtain great speed builders have reduced all the weights to be carried as much as consistent with the structural strength and stiffness necessary to the development of an exceptional and enormous power, and with the capacity to carry the required armament. This combination of qualities is exceedingly difficult to obtain in perfection, and thus it happens that only two or three firms in the world have been really successful in realizing the high qualities required, or have made much patronage as builders of fast torpedo launchers.

It must not be supposed that there is anything occult or very peculiar in the construction of the hull or machinery of these vessels, (they are both of well-known types,) except that they are very light and beautifully adapted to the immense work they are called on to perform, and their present development with the method of placing and arranging the torpedo-launching apparatus in them is the result of years of the most patient and careful experiment and effort.

It is very desirable, and in fact absolutely necessary to introduce the manufacture of vessels of this kind into the United States, and in order to do so readily and successfully we must make preparations to commence at the point of development which now obtains in Europe, otherwise we shall waste a great amount of time and money in going over ground which has already been explored; and to prevent this waste and delay I beg leave to suggest that an appropriation be asked for the purpose of purchasing a suitable torpedo boat and a set of working drawings from one of the most celebrated and successful manufacturing firms in the world.

Thus equipped, with an example of the most advanced type as a standard of comparison and with the necessary information for duplicating her, we should proceed with the construction of our own boats as the needs of the country may necessitate.

As this bureau is the one charged with the development of the naval torpedo service, I have made inquiry abroad and find that a first-class torpedo-boat can be purchased for \$50,000, and the working drawings of the same for \$5,000; and I beg leave to urge that Congress be asked to appropriate the money to procure one of these vessels.

I have the honor to be, very respectfully, your obedient servant,
MONTGOMERY SICARD,
Chief of Bureau.

Hon. WILLIAM E. CHANDLER, *Secretary of the Navy.*

Diplomatic Relations with Persia.

SPEECH

OF

HON. RUFUS R. DAWES,

OF OHIO,

IN THE HOUSE OF REPRESENTATIVES,

Monday, August 7, 1882,

On the subject of our diplomatic relations with Persia.

Mr. DAWES said:

Mr. SPEAKER: In bringing before Congress the subject of our relations with Persia, I was moved by the necessity that has so clearly been demonstrated of a better protection for American citizens in that country. The British Government has heretofore rendered us this service. But America should protect her own citizens and, at this crisis, she can do it more certainly and effectively by direct diplomatic relations with Persia than through the agency of any other government.

It is doubtful whether at this time the British Government could render such service as it did at the time of the Koordish war. There is less deference in Persia toward the Gladstone administration, and less regard for the good-will of England than existed at that crisis. This is the information I have from there. There is also a general revival of Mohammedan fanaticism throughout the East. These circumstances seriously menace the safety of the Christian missionaries should turbulence or disorder break out. The crisis demands prompt action on the part of this Government in the discharge of its duty of protecting its own citizens.

No class of citizens abroad more richly deserve consideration of their government than the American missionaries in Persia. For fifty years they have carried on their noble self-sacrificing work in that remote land. They have shown a devotion, a heroism, beyond praise, and they have established churches, schools, and colleges, and translated the Bible and distributed it throughout the whole

land, and the influence upon human progress and civilization is felt throughout Persia. By their good works, their discretion, their wisdom when in difficulty, they have commanded respect for themselves and good-will for the great nation they represent.

The wane of English influence is our opportunity in another direction. The occasion is especially favorable for promotion of commercial relations. Persia wants our commerce. Our cotton fabrics, our fire-arms, our manufactures, and our petroleum may find their way there if we open the door. England now largely controls this trade. The time is ripe, the duty imperative. Let this amendment of the Senate be concurred in, and so far as Congress is concerned the work is done of its duty of protection to its citizens. The wane of English influence is our opportunity in another direction.

Contested Election—Smith vs. Shelley.

SPEECH

OF

HON. FRANK E. BELTZHOVER,

OF PENNSYLVANIA,

IN THE HOUSE OF REPRESENTATIVES,

Thursday, July 20, 1882.

The House having under consideration the contested-election case of Smith vs. Shelley—

Mr. BELTZHOVER said:

Mr. SPEAKER: I am constrained by a sense of duty, for the first time in my life, to deliberately argue a case before a jury whose verdict is already made up and only waits impatiently to be recorded. I do not expect, therefore, to be able by anything I may say to change the inexorable decree of a partisan caucus or stay the revolutionary proceeding of electing members of this House by a packed Congressional committee, which but grinds out its grists to meet the most miserable party exigencies. I will not speak one moment longer than is absolutely necessary to present as briefly and plainly as possible some of the matters of fact and propositions of law on which the minority report of the Committee on Elections is based. I will only detain those who are waiting to officiate at the sacrifice of law and justice and propriety long enough to enter a respectful protest against the unholy act. I will not stop to maintain by argument that when the Constitution declares that we are the judges of the elections, returns, and qualifications of our own members, that it uses the word "judges" in its common acceptation and in the sense in which it is applied among men in all other judicial matters. We are judges in the fullest and completest sense, and are bound by all the sacred sanctions which surround and protect that office.

GERRYMANDERING.

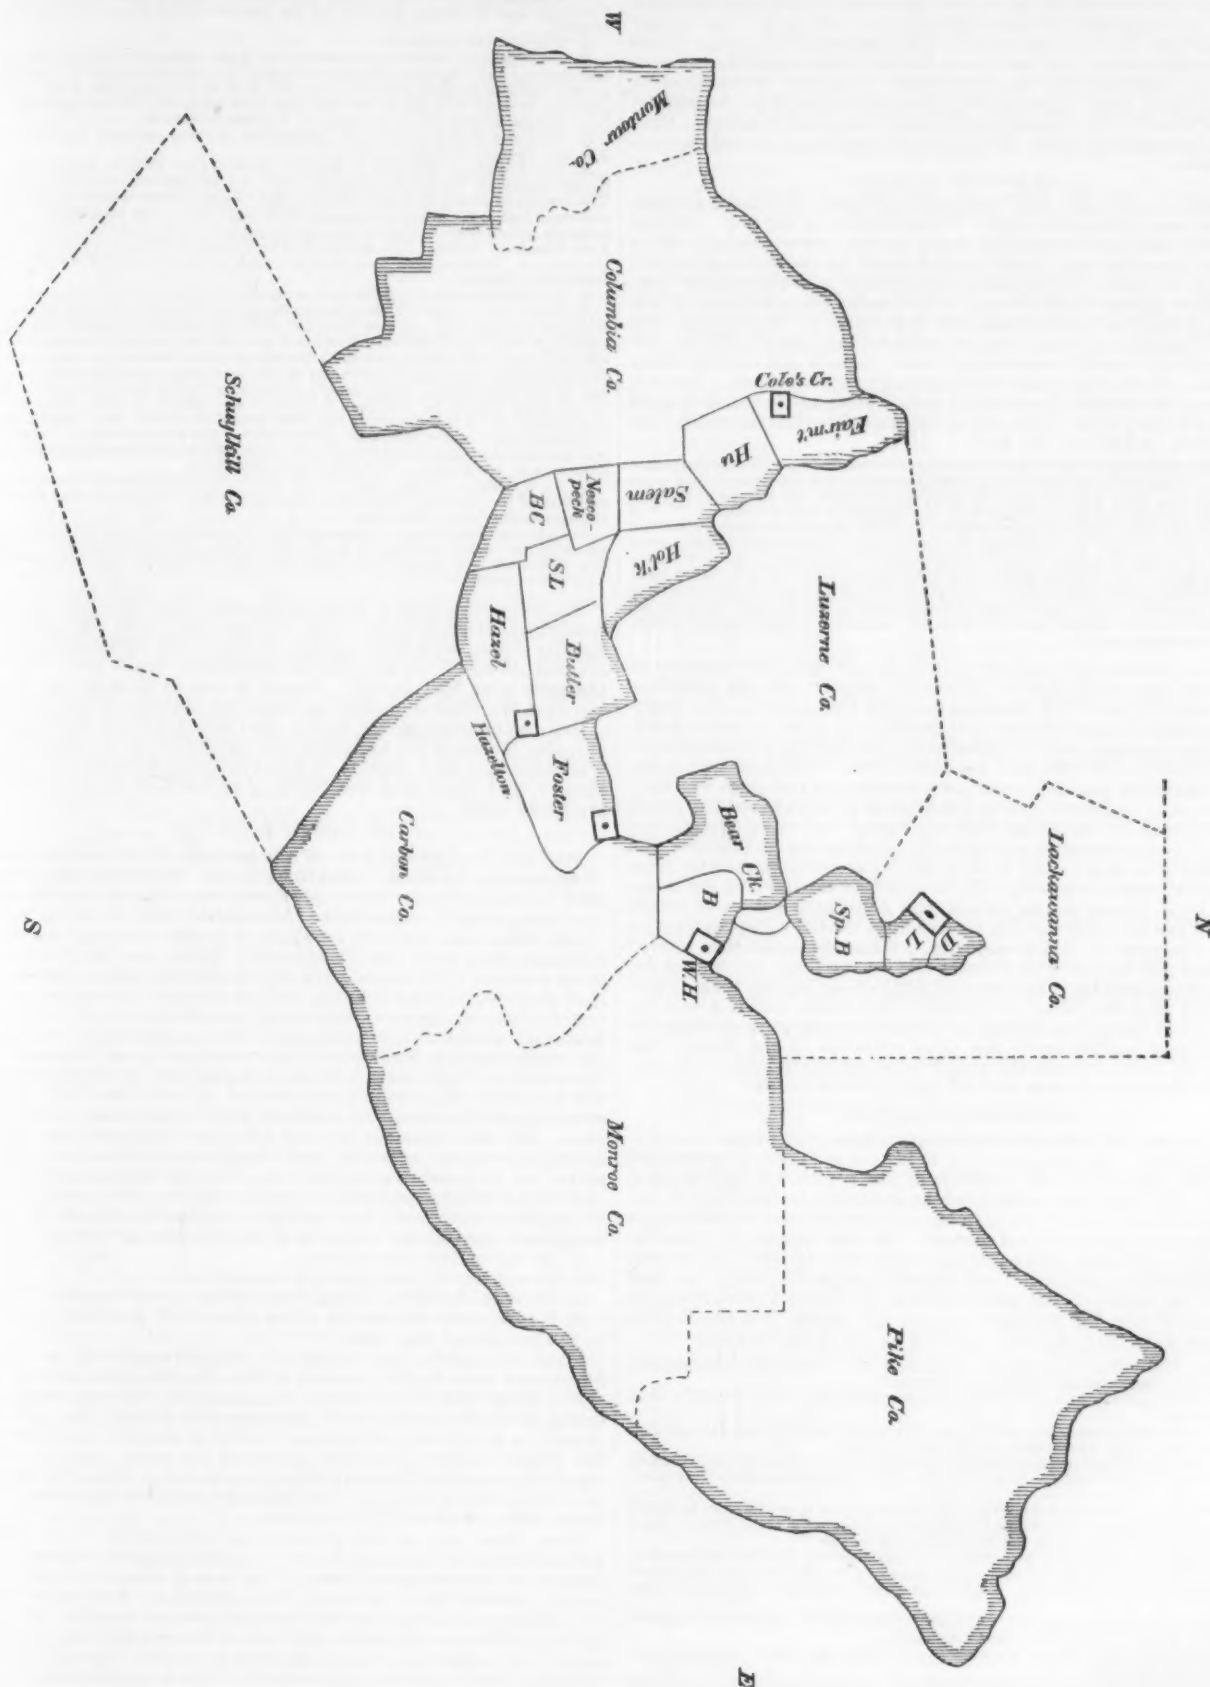

I therefore protest most earnestly that it is improper and highly indecorous in us, sitting in our judicial capacity, to indulge in miserable demagogical appeals to partisan and sectional prejudices and passions and interests. We are bound to consider only the question of the election and return and qualification of the contestant and contestee, and are bound by the law and the facts in the record. What has gerrymandering to do with the question whether Mr. Shelley or any other gentleman has a valid title to a seat in this House? What has gerrymandering in South Carolina and Ohio and New York to do with the determination of an election contest in Alabama? We are not now discussing gerrymandering. This is not the time and place to do so. I presented the subject and urged it earnestly and honestly upon the attention of this House last winter when the apportionment bill was under consideration. That was the proper time and place to debate the question. I did everything in my power to place in the apportionment bill a clause putting upon the States a strong and imperative inhibition against this great and threatening crime against just representation and free government.

Every man on the Democratic side of the House voted for such an amendment, but every Republican in the House, including the gentleman from Michigan, [Mr. HERR], voted against it. It does not lie in his province, therefore, to inveigh against gerrymandering in South Carolina or anywhere. He helped to encourage and sanction and support it by his vote. But there are stronger reasons than the vote of the Republican side on the apportionment bill why it is not their right to denounce unjust apportionment. When you consider that this crime has been carried so far in the Northern States that 1,500,000 Republican votes elect ninety Republican Congressmen, while 1,600,000 Democratic votes elect only twenty Democratic Congressmen, it is rather a thin and demagogical appeal to his constituents and his party for the gentleman from Michigan to criticize South Carolina. The beam removed from his own eye might permit him to see more clearly the mote in his brother's eye.

The gerrymander in South Carolina, while it is bad enough, is only boy's play when you contrast it with the work of the master gerrymanderer's hand in Pennsylvania. No State in the Union can justly be mentioned in the same category with the old Keystone State when the matter of unjust and unparalleled apportionment is

in controversy. The eleventh Congressional district in that State is a model for all the feeble imitators of this unrighteous and unpatriotic science in all the other States. That district is made up of remote counties joined together by townships and half townships, boroughs and half boroughs, so as to gather in its serpentine area

about 9,000 Democratic majority, and resembles a dumb-bell so nearly as to have become known as the dumb-bell district. The accompanying is an exact map of this district and its surroundings, illustrating as nearly as can be done the character of the contiguous territory of which it is formed:

But dismissing this subject with this passing reply to the arguments of those gentlemen who have dragged it into the debate, let us turn to the only question which is properly before the House—who was legally elected as a member of Congress from the fourth Congressional district of Alabama at the election on November 2, 1880? In this contention we must be governed by precisely the same rules of evidence and the same principles of law as prevail in any other tribunal for the administration of justice among men. These rules of evidence and law have been tested by the experience of centuries and approved by the considerate judgment of mankind in every civilized land. They govern the ascertainment of the highest rights of liberty and property everywhere else, and it is worse than wicked to argue that they should not be implicitly trusted and followed here.

THE ELECTIVE FRANCHISE!

The right to vote is a legal and political right; it is not a natural, absolute, and inalienable right; it is a creature of the law. It lives and moves and has its constant being in and under the law. It is fixed and bounded and limited and defined by the strictest technicalities of the law. It can only be exercised in conformity to law. An election is only valid when it is held under the provisions of law which are laid down for its sanction and security. There is no voting and there is no election except in strict compliance with the law which authorizes and empowers the voters to meet and exercise their franchise. There is no valid election except under the law. The person, then, who is elected according to law holds a title which is good against all the world. This rule is well stated in the celebrated New Jersey case, (1 Bartlett, 24, 26:)

Before a member is admitted to a seat in the House something like the judgment of a court of competent jurisdiction has been pronounced on the right of each voter whose vote has been received, and in order to overturn the judgment it must have been ascertained affirmatively that the judgment was erroneous. * * * When the polls are closed and an election is made the right of the party elected is complete; he is entitled to the returns, and when he is admitted there is no known principle by which he can be ejected, except upon the affirmative proof of the defect in his title. Every effort to oust him must accomplish it by proving a case. The difficulties in his path can form no possible reason why the committee should meet him half way. The rule of reason requires that he should fully make out his case, even though it require proof of a negative, and such is also a rule of Parliament in analogous cases.

In favor of this right and title to a high and valuable franchise as in favor of any other right of person or property all the sanctions and presumptions of law stand as defenses and guards. The interests of society all court repose and stability of titles of every kind, and all the instincts and sympathies of order-loving citizens cluster around them to protect and maintain them. The title which Mr. Shelley therefore has in his seat as a member of Congress can only be taken away and destroyed by the most clear and convincing proof. He stands upon his certificate under the great seal of an ancient and honorable Commonwealth, entitled to representation on this floor, and is so entitled to stand until it is invalidated and destroyed by clear legal and competent proof. That certificate fortified by the sanction of high official sworn action, the deliberate action of sworn officers of the law, attests that he was duly elected a Representative to this Congress by 2,651 majority. What does not that imply? That the legal voters of his district met on the legal day and at the proper places, and by a majority of 2,651 chose him as their Representative; that the votes were legally canvassed, counted, and returned by all the sworn officials provided for that purpose from the local precinct boards up to the chief executor of the State; that through all these avenues the proper legal ascertainment of the correct vote the majority was verified and found to be true.

TWO REPUBLICAN CANDIDATES!

The circumstances of the case co-operate to confirm and corroborate this result. No man who now holds a seat here or ever has held a seat here has more of the elements of just popularity than General Shelley. His high character, his long residence in the district, his kindness and courtesy toward all men could not but make him stronger than his party in any political contest. He was opposed by two competitors, both of whom with equal show of justice claimed to be the regular Republican candidate. Mr. Harris, (pages 257, 258,) who had been tax collector, sheriff, and member and senator, testifies most emphatically that Mr. Stevens, and not Mr. Smith, was the Republican candidate for Congress, and that he voted for Stevens:

Question. Who did you support for Congress at the last Congressional election for the fourth Congressional district of Alabama?

Answer. I cannot say that I gave an active support to any one; I voted for William J. Stevens.

Q. Did you or not preside at a political meeting held shortly before the last election at Marion, and in whose interest was that meeting?

A. I was at a political meeting held in Marion shortly before the last election, held in the interest of William J. Stevens, and by request presided at that meeting.

Q. What, if any, charges were brought at that meeting against James Q. Smith in reference to the manner in which he procured a delegation from Perry County to support him for Congress in the Hayneville convention?

A. My impression is that it was charged in this meeting that the delegates in the Hayneville convention who supported James Q. Smith were not the representative men of Perry County. I don't remember that there were any other charges.

Q. Was there not a large majority of colored voters in Marion precinct opposed to James Q. Smith as a candidate to Congress?

A. I don't think they were; they were divided here, but I don't think the majority were against him.

Q. Do you know any fact tending to show that the contestant in this case used

any illegitimate means to get himself declared the nominee of the Republican convention at Hayneville?

A. Nothing of my own knowledge.

Q. Was it not stated and urged by you and Joseph H. Speed and other influential Republicans of this beat, that James Q. Smith was not the nominee of the Republican party for Congress in this Congressional district?

A. I cannot say that it was urged by any one; I said to some of my friends that I thought that William J. Stevens was the nominee of the Republican party of this district.

Q. Why did you think so?

A. I was present at the convention as a delegate from this county, (Hayneville convention,) and witnessed the proceedings of the convention while it was held in a very confused manner, so much so it was hard to tell what was done. The impression created with me at the time was that a majority of the delegates regularly elected favored the nomination of William J. Stevens.

Q. Who was elected temporary permanent chairman of that convention, and was he a Stevens or Smith man?

A. The friends of William J. Stevens claimed that Benj. S. Turner was temporary chairman, whom they afterward elected permanent chairman, I believe. The friends of James Q. Smith claimed that Ben A. Lenorn was elected temporary chairman and J. C. Dukes permanent chairman; this is my impression. My impression is that Benj. S. Turner was the friend of Stevens, and Delemas and Dukes were friends of Smith. I do not know who Turner or Duke supported. During the canvass, Delemas came over here and made a speech in favor of Stevens; just before the election.

Q. Was there or not a split in that convention? If so, give an account of it.

A. There was a split in that convention. The friends of James Q. Smith attempted to elect and claimed they did elect the officers of the convention; the friends of William J. Stevens attempted to elect and claimed they did elect the officers of the convention, and the proceedings of the convention were conducted in a very confused manner by two sets of officers trying to preside at the same time and at the same place. This created so much confusion that it was very difficult to tell what was done. William J. Stevens was placed in nomination while the convention was in this condition and voted for by his friends, and claimed by them to be nominated by the chairman of his friends; and the name of James Q. Smith put in nomination and voted for by his friends, and claimed to be nominated by the chairman of his friends. Both sides then adjourned.

Q. As a member of that convention, who in your opinion was nominated by a majority of the representatives who composed it for Congress for the fourth Congressional district of Alabama?

A. It is very hard to tell, the convention was conducted in such a confused manner, who was legally nominated by the convention; my impression at the time was that if there was any legal nomination made that William J. Stevens was the man who was nominated.

We have therefore a Democratic candidate running against a wrangling, divided party with two equally valid candidates and equally strong with their party. It cannot be contended that thus divided either of the Republican candidates could have obtained a plurality over Mr. Shelley. Indeed it was as clear as the noonday sun that Mr. Shelley was bound to have a plurality if not a majority.

But the contestant, Mr. Smith, and a majority of the committee actually ignore or try to ignore this candidacy of Mr. Stevens, and whenever they find ballots in a box in large numbers for Stevens they cry out fraud, and charge that the ballot-box was stuffed and tampered with.

THE EVIDENCE IN THE CASE!

Now, let us glance at some of the grounds of the contest and the allegations on which it is said to be based. The contestant contends that in Dallas County seven precincts were rejected by the county canvassing board, whereby he [Mr. Smith] lost about 2,000 votes. These votes were rejected for want of proper returns, and the law presumes they were legally rejected. What was Mr. Smith bound to do to count such votes? Clearly to show by legal evidence, first, that there was a legal election held at all these precincts, and, second, to show by legal evidence what was the true vote cast, and for whom it was cast at said precincts. Now, in passing, it must not be forgotten that Mr. Shelley contends most stoutly and earnestly that there was no legal election at these points, and no legal votes cast. But at the elections which are alleged to have been held at these precincts all the officers of elections were Republicans—every one of them. All the evidences of every kind and character, therefore, at these polls was in the control and custody of the friends of Mr. Smith and of the very easiest access to him. It could not be tampered with or changed in any way except by his friends. Now, under the law of Alabama there were four kinds of evidence by which Mr. Smith could have proved the true vote of any of these precincts:

1. By the ballots themselves.
2. By calling or interrogating the voters.
3. By supplementing the informal returns made by parol evidence.
4. By witnesses who could swear from their personal knowledge as to the state of the vote.

Now, as to the ballots, which are retained under the law of Alabama, and were in the custody of Mr. Smith's own friends. One undeviating rule of evidence is that the best evidence must be produced of which the nature of the case will admit; that secondary cannot be substituted for primary evidence unless it be shown that the latter is not within the power of the party, and the former should certainly not be substituted for the latter when it is apparent that the primary evidence is within the reach of the party and is by the law placed within his power.

Now, there are certain documentary evidences of the election which the law of Alabama provides should be preserved for the sole purpose of furnishing evidence of the vote in case of contest; these are the ballots which were cast at the election. The ballots cast at each voting place, together with one poll list, are required to be carefully sealed up in the ballot-box and delivered into the custody of one of the inspectors, who is required to retain it for sixty days intact, and then to destroy the contents of the box unless he is notified

that the election of some officer for which the election was held will be contested, in which case he must preserve the box for such election until such contest is finally determined or until such box is demanded by some other legal custodian during such contest. (Section 288, Code of Alabama.)

It will be seen that the ballots are required to be preserved expressly for the contestant. These are the evidences of the result of the election which the law provides. In addition to this the certified poll lists, statements, &c., which are returned by the board of inspectors of each precinct and the county board of canvassers, are required to be retained intact in the office of the judge of probate. (Section 293, Code of Alabama.)

Now, if the returns are made by the board of inspectors and are attacked, or if insufficient or defective returns or no returns are made, will it be denied that these ballots are the best evidence of the result of the election, especially where it must be admitted from the nature of the case that the ballots in the box retained by law for the purpose of evidence are the genuine ballots which were cast at the election?

And if it be true, as it is, that the ballots from the election at each of these precincts in Dallas County were placed in the custody of the Republican inspector by the Republicans, that they were received from the hands of the voter by Republicans only, counted by Republicans only, placed in a box and sealed up by the Republicans only, will it be gravely contended that the contestant should be permitted to offer secondary and inferior evidence to prove what the vote was at the several voting places without having attempted to put these ballots in evidence or furnish any reason or excuse whatever for his failure to do so? In no instance is any inquiry made for the ballots, nor is any effort made to produce them, not even where the testimony itself shows to whom the ballots were committed, and even in those cases where the person who had the ballots in his custody, as shown by the testimony, appeared and was examined as a witness by the contestant. Without showing that the ballots were not in his power to produce, contestant resorts to oral evidence. This he clearly could not do. Oral evidence cannot be substituted for any instrument which the law requires to be in writing, and no proof can be substituted therefor so long as the writing exists and is in the power of the party. (Greenleaf on Evidence, section 86, volume 1.)

But the contestant having declined to put the ballots in evidence just as they left the hands of the voters, fresh from the custody of his devoted friends, uncontaminated and unchanged, why did he next decline to call the voters themselves? Why did he not interrogate these hundreds of people who he alleges met and held a legal election and voted for him? He does not even trust the third kind of evidence, but resorts to the last and most unreliable of all. The returns from the seven precincts of Dallas County were rejected because they were utterly unintelligible and invalid; they did not have a semblance of legality or regularity. They were made out by the most illiterate and unskillful people, who never held an election and did not know how to do so. These returns did not evidence anything.

MARTIN'S PRECINCT!

The rejection was the solemn adjudication of the subject by an intelligent board of sworn officers of the law in the performance of their duty. How does Mr. Smith propose to overcome this action and prove a legal election and the legal vote which he alleges was cast for him? Does he produce the ballots which were alleged to have been cast and which were intact and untouched in the hands of his friends? Oh, no; he does not trust that. Does he call the persons whom he alleges voted for him and who were easily reached and could have been sworn? No; he does not dare to do that. Take Martin's precinct and see what he does do. He calls two illiterate, ignorant, and stupid colored men who can neither read nor write, who sign their names with marks, Abe Martin and Ned Petteway, and by their sole uncorroborated testimony he attempts to prove and the majority of the committee count for him (Smith) 364 and for Shelley 16 votes.

Why, Abe Martin swears he cannot read or write; that he cannot tell the difference between a Democratic and Republican ticket; that they put the tickets on the floor and counted them in two hats; that the clerks told him there were 16 Democratic votes.

Where in the name of God are the clerks? Why are they not called? Why not call those who might possibly have known the state of the vote? Why not call those who may have read the tickets? Why call these ignorant people who only know by hearsay and testify without knowledge?

A. Martin says that the clerks read the names on the tickets, and it is not pretended that any of the inspectors read them. He only knows that there were 16 Democratic votes cast, because, as he states, (record, page 124,) "I made them (the clerks) hand them out to me."

To show how unreliable is the testimony of the witness Martin, and of these witnesses generally, we ask attention to his statement, (record, page 124,) where he swears positively that the statement of the result of the election was signed by the inspectors; and yet when that statement is put in evidence it is found to be unsigned. Now, if these ballots were simply counted as Democratic or Republican, and if all the candidates on the Republican ticket were the Republican

candidates, and all the candidates on the Democratic ticket were only Democratic candidates, how is it possible to determine from this testimony whether or not Mr. Stevens received any votes? The law of Alabama in regard to the counting of ballots is as follows:

SECTION 1. In counting out, the returning officer or one of the inspectors must take the ballots one by one from the box in which they have been deposited, at the same time reading aloud names of persons written or printed thereon and the office for which such persons are voted for. They must separately keep a calculation of the number of votes each person receives and for what office he receives them; and if two or more ballots are found rolled up or folded together, so as to induce the belief that the same was done with a fraudulent intent, they must be rejected; or if any ballot contains the names of more than the voter had a right to vote for, the first of such names on such ticket to the number of persons the voter was entitled to vote for only must be counted.

When asked what oath was taken by the inspectors the witness Martin tells us:

I swore the inspectors; I told them to raise their hand and say, you solemnly swear to go forth and do the best they could in this election to discharge those duties.

The law makes the following provision as to the oath:

Before opening the polls the inspectors and clerks may take the oath to perform their duties at such election in accordance to law, to the best of their judgment, and the inspectors must also swear that they will not themselves or knowingly allow any other person to compare the number of the ballots with the number of the voters enrolled, which oath may be administered to the inspectors by each other, or by a returning officer, or by a justice of the peace. (Code of Alabama, section 265.)

Why, there is not a syllable of testimony given by this witness which is worth anything. It is the most miserable hearsay, with the additional objection that it is given by a very stupid and willing witness.

Ned Petteway, the other witness, swears he can read very little and cannot write; that he stood outside of the window and gave directions as to the counting; that he was forty yards or more away from the polls when the voters cast their ballots. Read the description which he gives of the count, (page 119:)

Question. What was the first thing done after closing the polls?

Answer. They pour the ticket out de box; each man had his hat and commenced counting; then they told the clerks to tally every time when they come to a Republican vote; they said Republican and then Dimycrat vote, they said Dimycrat, and tallied for them.

Q. Did each one of the persons in there count tickets into his hat?

A. Well, I think they did; I couldn't see every man.

Q. How many could you see counting tickets into his hat?

A. I could see three, cause dem was in front; I could see dey hats.

Q. Were they all counting at the same time?

A. Yes, sir.

Q. Could you see the tickets as they were counted?

A. Yes, sir; I could see 'em, but I couldn't tell a 'Publcan ticket from the other one at that distance.

Q. As soon as they concluded counting did each man empty the tickets from his hat into the ballot-box, or what did they do with them?

A. No, sir; as soon as they finished counting into the hats they emptied the ballots on the floor.

Q. How long did they remain on the floor, and what was afterward done with them?

A. They staid there about a quarter of an hour and then count them back into the box.

Q. They were then counting the number, were they not—they did read the ballots then, did they?

A. They were counting and did not read the ballots at that time.

Q. Did any one of them, after first counting some of the ballots into his hat, count over the number he had in his hat?

A. Each of said men counted said ballots, which he had in his hat, two or three times.

Q. Did each man count the ballots in his own hat?

A. Yes, sir.

Q. After the first time he counted them into his hat, was the other counts made to see the number of the ballots each had?

A. It was.

Q. The tickets were never read but once, were they?

A. No, sir.

Q. And then they were read as Republican or Democrat?

A. Yes, sir.

Q. You say that you saw three men each counting tickets into his hat; what three did you see?

A. I didn't zactly take particular notice what men they were, but then I know Abe Martin was one of the men.

Q. Can Abe Martin read and write?

A. I do not know.

On the uncorroborated testimony of these two witnesses the majority of the committee count 384 votes for Mr. Smith. Such a proceeding is worse than a travesty on free elections, and a seat in Congress based on such testimony will bear with it the brand of idiocy or rascality written all over it and stultify or criminate the man who accepts it.

Where are the ballots placed in Stepony's (the Republican inspector) hands and kept by him? Why in the name of justice and decency are they not produced or accounted for? Where is there a reputable court in Christendom that would not compel the production of such a record evidence of the ballots in this case and against such testimony or compel the showing of a reason why they are not produced? Why were the voters not called; these 384 voters? Where are the persons, if any, who read or could read a single ticket?

Not one of these matters of evidence is touched. But on the miserable, uncorroborated hearsay of two illiterate negroes a solemnly adjudicated election to a high office is to be overturned. And this is but a sample of the whole contest.

LEXINGTON PRECINCT.

Take Lexington precinct next. Here the informal return which was rejected gave Smith 140, and Shelley 11. Of this rejection the

contestant complains, and yet at this precinct, by the uncorroborated testimony of two witnesses, he alleges that he has proved and the majority find for him (Smith) 320 votes and for Shelley none. Only two witnesses are examined, and these are July Adams and Harris Mosely. Adams was present, and assisted in the counting of the vote. He says that the ballots were never read when they were counted. (Record, pages 127, 128.) They were all considered as Republican ballots and as votes for contestant, and so counted without ever being read. His testimony as to this is as explicit and positive as testimony can be made, and there is no evidence to contradict or discredit it:

Question. Who received the tickets from the voters?
 Answer. Avery Hurst received the tickets from the voters.
 Q. What did he do with them?
 A. He handed them to Aaron Malette, who was numbering them at the box.
 Q. Were the tickets folded when they were received by Avery Hurst?
 A. Yes, sir; they were folded.
 Q. What did Aaron Malette do with them?
 A. He numbered them and put them in the ballot-box.
 Q. Did he number every one?
 A. Yes, sir; he numbered them all.
 Q. What numbers did he put on them?
 A. He commenced with one and numbered from that on up.
 Q. What did Dan Davis do?
 A. He was one of the clerks and wrote down the names of the men who were voting.
 Q. Did he write every man's name as he voted?
 A. Yes, sir.
 Q. Did he put a number by the side of the name?
 A. He did, sir.
 Q. Was it the same number that was put on a man's ticket?
 A. It was the same number.
 Q. What did Perrie King do?
 A. He was a clerk, and took down the names of the men who voted.
 Q. Did the inspectors have any registration list?
 A. No, sir; they had no list.
 Q. Did any one register on that day?
 A. I did not see any one.
 Q. Was any certificate of registration handed in to the inspectors by any person offering to vote?
 A. If there was any I did not see it.
 Q. What time did the polls close?
 A. The polls closed at five o'clock p. m.
 Q. What was then done by the inspectors?
 A. They counted the tickets.
 Q. Describe exactly how they did this—what each man did.
 A. They counted them one by one. They took them out of the box, one by one, looked at and read them as they were taking them out, and then put them on a paper lying on the floor.
 Q. Who took them out of the box?
 A. Aaron Malette took them out of the box, one by one.
 Q. Did he open the tickets when he took them out?
 A. He did not open them.
 Q. Did he put them on the paper on the floor?
 A. Yes, sir; he did.
 Q. What was done with the tickets after Aaron Malette had put the last on the floor?
 A. He took them up and put them back in the box again.
 Q. Did any other person handle those tickets after the polls were closed?
 A. No, sir; no other person handled them.
 Q. Do you mean that Aaron Malette was the only person who handled the tickets after the polls were closed?
 A. No one else but Aaron Malette handled the tickets after the polls were closed.
 Q. Are you certain that Aaron Malette did not open the tickets?
 A. I am certain of it.
 Q. Did any one open the tickets after the polls closed?
 A. Not that I saw.
 Q. Were you present until they all left the room?
 A. I was, sir.
 Q. Who kept the tally you spoke of in your direct examination, and how was it kept?
 A. Perrie King kept the tally, and he did it by figures on a piece of paper as they called out the vote.
 Q. When Aaron Malette put the first ticket on the floor did he call out one; when he put the second on the floor did he call two, and so on, and did Perrie King write one, two, &c., as Aaron Malette called the number?
 A. Yes, sir; that was exactly the way it was done; just as he called he wrote.
 Q. Did Aaron call anything else as he put the ticket down except the number?
 A. No, sir; he did not call anything else except the number.
 Q. How close were you to Aaron while he was counting this way?
 A. I was right at him.
 Q. Did you see every ticket as it was taken from the box and put on the floor?
 A. Yes, sir; I did.
 Q. How long did the tickets remain on the floor?
 A. They remained on the floor about five minutes.
 Q. Do you mean from the time Aaron Malette commenced counting until he put the last ticket on the floor that it was about five minutes?
 A. Yes, sir.
 Q. Were they put back into the box immediately after the last ticket was placed on the floor?
 A. Yes, sir.
 Q. Was the box then locked up?
 A. The box was then locked up.
 Q. Who took the key?
 A. Avery Hurst kept the key.
 Q. Was that box with the tickets in it opened again before the inspectors left the polling-room?
 A. No, sir; it was not opened any more.
 Q. Where is that box now?
 A. Mr. Avery Hurst said that he carried it to the sheriff's office.

Witness Mosely was a deputy marshal who did not see the votes counted and does not pretend to know what the vote was. (Record, pages 129-131.)

These ballots have never been counted so as to ascertain the actual result of the election.

Neither of these witnesses read a single ticket or counted it except to ascertain whether the number of ballots corresponded with the

tally list. The tickets were never read or counted to determine for whom they were cast or how many were for each candidate.

Where are Malette and Hurst, who handled the tickets and read them, if any one on the earth did?

Besides, Mosely swears that there were in that precinct 300 Republican voters and 60 Democratic voters; yet 320 votes are given to Smith and none to Shelley. Where are the ballots?

Why are the voters not called? There is no earthly answer, except that these kinds of testimony did not suit the purposes of the contestant as well as the parol testimony of these illiterate and blundering but accommodating negroes.

Every other of the seven precincts in Dallas County is similar to these; and yet on such testimony the committee propose to count over 2,000 votes and unseat General Shelley.

In Chillatchi precinct the inspectors numbered the ballots, in violation of the law, and in direct violation of their oaths compared the numbered ballots with the name opposite the corresponding number on the poll-list. (Record, page 143.) No account of the vote cast was kept by the inspectors as the ballots were being counted. In the language of the witness "no one did any writing while the votes were being counted." (Record, page 143.)

The provisions of law in relation to the counting of the ballots were entirely disregarded. The tickets were not read when they were counted, or at any time, as far as it appears by the evidence. They were counted by William Perry, a clerk, and not an inspector of the election; and Lindsey Irby swears that Perry opened the ballots to keep from counting two, but "that he never did read them all over any time." (Record, page 136.) Lindsey Irby swears:

Question. When the polls were closed who took the tickets out of the box?
 Answer. William Moseley took the tickets out of the box.
 Q. What did he do with them?
 A. Handed them to William Perry.
 Q. What did Perry do with them?
 A. He took the tickets, each one, and called the name the man was voted for and then put them in a hat.
 Q. Are you sure he did not read the tickets?
 A. He did not read them, but he opened every one and looked at it to see whose ticket it was.
 Q. How did he know who had voted each ticket?
 A. He had the number of them on the poll list.
 Q. Did he look at the number on the ticket and then the number on the poll list to see who had voted the ticket, and did he then call the man's name he found on the poll list?
 A. Yes, sir; he looked at the number on the ticket and on the poll list, and then called each man's name, because I took down each man's name as he called it.
 Q. Do you mean he called the names on the poll list that he found opposite the number that appeared on the ticket?
 A. Yes, sir.
 Q. And did you then write down the names as he called them on the paper I now show you? [Showing Chillatchie C.]
 A. Yes, sir.
 Q. What was then done with the tickets after he had put them in the hat?
 A. They were counted back and tallied.
 Q. Do you mean they were counted back to see how many there were?
 A. Yes, sir; and to tally them we counted them three or four times to see how many there were.
 Q. Who counted them back from the hat into the box?
 A. William Moseley took them from the hat and handed them to William Perry, and he put them in the box.
 Q. Didn't William Perry open those tickets then?
 A. Yes, sir; he opened them every time to keep from counting two.
 Q. Did he read them then?
 A. He never did read them all over any time.
 Q. Were they taken out of the box after that? By whom, and for what purpose?
 A. Yes, sir; by William Perry, to count them back into the hat again.
 Q. What did he count them back into the hat for?
 A. To see if they were right; to see if the number of ballots were correct.
 Q. What was then done with them?
 A. William Moseley put them into a small sack and took them home with him.

Where are the ballots and where the voters in all these precincts? The ballots are not produced and the voters are not called.

WHITE HILL PRECINCT.

Take next White Hill precinct, in Lowndes County. Here contestant's own witness and agent, McDuffie, swears that when the box was opened it contained about 45 votes for Smith and 200 or 300 for Stevens.

But whenever votes were found for Stevens in this contest they are assumed to be fraudulent, although he was as much a Republican candidate as Smith, and because McDuffie is of opinion that the box was tampered with the vote as found is rejected, and 276 votes are counted for Smith and 14 for Shelley. Smith had not a vote in the box. Stevens had the ballots. Now, McDuffie says:

It's my opinion, from examination and inquiries I have made, that there was a fraud at Whitehall beat, and that it was done by the box being opened from the bottom and everything in it except 45 tickets with Smith's name upon them taken out and these Stevens tickets put in.

McDuffie was the warmest friend of Mr. Smith, and was the officer before whom all of his testimony was taken. He does not inform us what was the extent of his examination or the nature of the inquiries he made. Now, contestant having proved what were the character of the ballots found in the ballot-box by his own witness, it is then attempted to set aside the force of this testimony by accepting the mere opinion of this witness that the box was tampered with. But there is positive evidence that the box when opened by the board of canvassers was, with its contents, in the same condition as when delivered by the inspectors to the returning officer of the precinct and by him delivered to the returning officer (the sheriff) of the county.

The returning officer of the precinct was Philip White, the Republican United States supervisor, and he swears that he delivered the box intact to the sheriff of the county (record, page 176,) and Mr. Graves, the sheriff, swears that the box, with its contents, was delivered by him to the board of canvassers in the same condition in which it was received.

It is not pretended that the ballots were tampered with before they were delivered to the returning officer of the precinct; nor could it be, because White, Republican supervisor, and Willis Brady, (record, page 199,) the Republican inspector, testified to the contrary; nor can it be pretended that the official statement of the result of the election was put in the box and fraudulently extracted, because White, the Republican supervisor and returning officer, testifies that nothing was in the box "but the clerk's list and the tallies."

The box and the ballots are not put in evidence, so that the House is unable to say from examination whether the bottom of the box had been removed or whether anything in the appearance of the ballots indicated that they were not those actually cast. The statement of the witnesses, supporters of contestant, that the vote was different from what the ballots themselves show, is setting up the mere oral declarations of these witnesses as to what the count was, or the count itself against the ballots, it not having been shown that they were not the actual ballots cast at the election. The officers of the election, White and Brady, who testify that the vote as counted does not conform to the ballots as found in the box, were also the officers who negligently or corruptly neglected or failed to make the board of canvassers a lawful return of the vote. Under these circumstances it appears to us that the only satisfactory evidence as to what the vote was at this precinct must be the testimony of the voters themselves, and they have not been examined.

Where are the ballots and where the voters in this precinct?

HAMBURGH PRECINCT.

Take next the Hamburg precinct, in Perry County. Here the committee give Smith 250 and deduct from Shelly 167 votes, making a difference of 417, on the almost uncorroborated testimony of one Watson, a Republican supervisor, who swears that Juan Harris changed the ballot-box. Is it true? (1) Watson made no protest; (2) he went on and counted the vote; (3) made out his supervisor's return and swore to it, in which he gave Smith 336, Shelley 40, Stevens 5, in all 383, while he swore there were only 378 votes cast; (4) but, what is strangest of all, he did not tell the committee of five next morning. Watson swears he got the data for his report and which the committee take as true, as follows. He says "I knew the sentiments of the people and just how they would vote, and I taken a record of the committee's list and got my information from them." He kept no list or record himself. (Record, page 110.) The other witnesses as to the actual vote are Green Johnson, a deputy marshal, and J. T. Harris. They were not officers of the election, and were not in the room where the election was being conducted. This room was in the second story of the building, and to cast his ballot the voter had to enter the building on the first floor and then ascend a flight of stairs. (Record, page 256.)

There was a "committee" of Republicans, five in number, to keep an account of the Republican vote as cast, and they selected one Silas Benjamin to take down the names of the Republican voters. (Record, page 144.) But not one of these committeemen nor Benjamin is examined as a witness, nor is the list of names kept by Benjamin put in evidence. The witness Johnson states that Benjamin told him that there were 340 names in his book, and he has no other knowledge of its contents. (Record, page 146.) J. T. Harris kept a tally of 323 voters whose tickets he saw in their hands, but he states that he does not know whether these tickets were actually cast, as he did not see one of them voted. (Record, page 256.) The voters themselves are not examined.

But there is a more serious deficiency in the proof as to this precinct and county. There is no evidence as to the votes counted by the county canvassing board at each precinct. How can any precinct or the whole vote of the county be corrected without this data? (See page 12, minority report.)

SCOTT PRECINCT.

Take next Scott precinct, Perry County. Here the committee reject the poll and add 274 votes for Smith and deduct 190 from Shelley, making 464 votes difference, on the testimony of Walter Lowery, who swears that Turpin, the Democratic judge, gave him (Lowery) \$35 to permit him to change Smith to Shelley tickets, and that he (Lowery) did so.

Do you believe such an incarnate scoundrel? Let us look at his testimony. He confesses, first, to taking the bribe; second, to committing the fraud; third, to keeping the money; fourth, to making the tally suit the fraud; fifth, to making his supervisor's report and swearing to it; sixth, to living with Smith on his place and with Smith's brother.

He is corroborated by no one. On the other hand, Lazarus Avery, Republican inspector, contradicts him; Turpin contradicts him; Lee contradicts him; Driver contradicts him; Evans and all others contradict him. Perryman swears that Lowery told him the election was fair and no money had been offered to him; but that Smith and Huston had tried to make him swear that money had been offered him, but that he would go to the penitentiary ten years before he would do that.

The tallies sworn to by both Lowery and Avery are utterly insufficient to prove how the vote was. (See Lowery, 160, 161; Avery, 294.)

The ballots are not produced; the voters are not called; the persons who gave tickets to voters are not called. On such testimony 464 votes are held to be proven against General Shelley.

These are fair examples and exhibits of the testimony on which it is proposed to overcome and invalidate and destroy the title to a high and valuable franchise which rests on the sworn official action of men of high character and acting under the solemn sanctions of their oaths. No judicial tribunal in any civilized land would permit such testimony to determine any issue of the slightest moment. Any respectable court would compel the production of the ballots, or demand a reason for the failure to do so. Mr. Shelley has as good a right to his seat until it is assailed in a legal way and by proper testimony as any member on this floor. Whatever would be wrong in an assault upon your seat is wrong in this case.

The contestant was not elected, and the testimony does not show that he was. The testimony is not competent to show anything. It is not only illegal and incompetent but it is adduced in defiance of the plain principle of law which governs the admission of evidence that he was bound to adduce the best testimony within his reach and accessible.

Why did he not procure the ballots from the custody of his own party friends, untouched, untampered with, fresh from the hands of the voters? Why did he not call the voters themselves? There can be no just reason except that these things would not have sustained his case.

But without any regard to whether he should or should not have produced other kinds of evidence, it is entirely sufficient for the present purpose to say that the testimony which he did adduce utterly fails to sustain his case. Never was the rule laid down in the celebrated New Jersey contest, and which we have quoted above, more applicable than here:

When the polls are closed and an election is made, the right of the party elected is complete; he is entitled to the returns, and when he is admitted there is no known principle by which he can be ejected, except upon the affirmative proof of the defect in his title. Every effort to oust him must accomplish it by proving a case. The difficulties in his path can form no possible reason why the committee should meet him half way. The rule of reason requires that he should fully make out his case even though it require proof of a negative, and such is also a rule of Parliament in analogous cases.

Internal-Revenue Taxation.

SPEECH

OF

HON. WILLIAM R. MORRISON,

OF ILLINOIS,

IN THE HOUSE OF REPRESENTATIVES,

Thursday, June 22, 1882.

The House being in Committee of the Whole on the state of the Union, and having under consideration the bill (H. R. No. 5538) to reduce internal-revenue taxation—

Mr. MORRISON said:

Mr. CHAIRMAN: The honorable gentleman from Pennsylvania [Mr. KELLEY] was probably correct in saying the financial condition of the country presented a spectacle not before witnessed in the world's history. That spectacle, sir, is the chairman of the Committee on Ways and Means, the American chancellor of the exchequer, struggling to reduce the revenues and maintain taxation; striving to empty the Treasury of his Government without relieving the burdens of the people. I am not complaining because this bill repeals or reduces taxes. My complaint is that it does not repeal or reduce other taxes; that it reduces those that are least burdensome, while it retains those which are most oppressive to the people. It so reduces taxes that every dollar of tax taken off reduces the revenues of the Government to the same extent. There should be some reduction of those taxes which might be so reduced that when we take a dollar from the revenue we may get rid of three dollars of taxation.

The taxes to be repealed are \$11,317,797 on banks and bank checks; \$3,278,580 on matches; \$2,226,503 on proprietary, including some quack medicines and perfumery; in all something more than sixteen million dollars. To that extent the revenues are to be reduced by the first section of the pending bill. The Secretary of the Treasury, in his message to us at the present session, recommends that these taxes be taken off if "there shall be a reduction of the revenues derived from taxation." But he recommends more than is contained in this bill. He says:

The other source of revenue where a reduction may be made is the customs. While it is a principle that taxation for the expenses of Government, to be just, should bear on all alike and equally, it must also be one that when the aggregate of taxation is to be lessened the reduction should be made in such ways that all will be relieved alike and equally. Hence, it is assumed that if Congress does determine on a decrease of the revenue, it will seek that end as well through a revision of the existing tariff laws as through an abolition or abatement of the internal revenue.

Now, sir, it will be seen that this bill does not recognize or conform to that principle of taxation which the Secretary says "to be just should bear on all alike and equally." Congress determines on a decrease of revenue, but does not "seek that end as well through a revision of the existing tariff," but alone from the "abatement of internal revenue." The tariff and its revision has been given into the protective care of nine wet-nurses—a flimsy device to avoid and prevent the reduction of taxation in such a way that all will be relieved alike and equally, and in violation of that principle of taxation which the Secretary says should bear on all alike and equally to be just. This bill is a fit supplement to the tariff-commission scheme and a further denial of justice, because it avoids any adequate reduction and equalization of taxes.

We collect from customs \$48,000,000 on sugar and molasses; \$27,000,000 on wool, woolen goods, and clothing; \$11,000,000 on cottons; \$21,000,000 on articles of iron and steel; \$3,000,000 on window and other glass; \$1,000,000 on salt; \$1,000,000 on rice; \$1,000,000 on lumber and articles made from wood; more than \$500,000 on books and maps. It has been shown over and over again that the tax on some of these articles yields \$8 in bounty to the manufacturer to \$1 in revenue to the Government. The reduction of \$16,000,000 in the revenue derived from them would decrease taxation \$50,000,000.

The second section of the bill proposes to reduce about 40 per cent. the license or special tax on retail liquor and other dealers, estimated to number six hundred thousand. This section is not to take effect until after the adjournment of the next session of Congress, and may be made contingent on the votes of the six hundred thousand to be affected by it, and who remain subject to the surveillance and taxation of both national and State authority.

The third section reduces the tax on cigars to \$5 per thousand. When the tax on tobacco was reduced to one-third, from 24 to 16 cents, no reduction was made on cigars, which were left at \$6. They should be reduced to \$4, to correspond with the reduction made in tobacco, and cigarettes should be further reduced in like proportion.

The taxes repealed are chiefly collected at the Treasury and from the sales of stamps; of all taxes collected these are least expensive. The amount of reduction exceeds one-eighth of all internal taxes, but the reduction is so made as not to dispense with the service of a single officer or agent of the more than four thousand employed in the internal-revenue service.

If our surplus revenue amounts to but half the sum claimed by the honorable chairman [Mr. KELLEY] and other advocates of the speedy abolition of all internal-revenue taxes, the reduction now proposed is less than half the reduction which can safely be made and which should be made. Both gentlemen from Pennsylvania [Mr. KELLEY and Mr. RANDALL] claim a surplus of at least \$135,000,000. Sir, we have no such surplus, especially not if we pay the public debt when it is payable and when it is due at the option of the Government.

Before the Presidential election of 1872, when that old Massachusetts Yankee, now Hon. Senator DAWES, held the purse-strings of the House, he succeeded in scolding his party associates into such habits of economy in appropriations and expenditures that they were reduced to \$124,000,000 for ordinary expenditures, not including pensions or the public debt. I do not include payments on account of pensions or the public debt among ordinary expenditures.

When that election had passed, and General Garfield—that more amiable man and perhaps better representative of his party in all that pertains to what is popularly known in Washington as "liberal appropriations"—had been made chairman of the Committee on Appropriations, expenditures largely increased.

The average annual ordinary expenditures for the four years—1873, 1874, 1875, and 1876—a little exceeded \$141,000,000. These were the last four years when the party now in the majority here controlled all departments of the Government and made the appropriations.

The average ordinary annual expenditures for the five years last past—1877, 1878, 1879, 1880, and 1881—were less than \$120,000,000. For these five years the appropriations were made by what is now the minority side of the House.

The gentleman from New York [Mr. HISCOCK] and his Committee on Appropriations have been proceeding with commendable caution, and for a time gave encouragement to the belief that they would keep down appropriations and expenditures to the all-sufficient sums provided by their late Democratic predecessors. This I do not doubt was the purpose of the committee, and especially of my left-handed friend and colleague, [Mr. CANNON,] to whom I by no means intend to offer a "left-handed compliment." But it must be apparent to all that the old disease is breaking out, and that the demand for "liberal appropriations" which carried expenditures in General Garfield's time up to \$141,000,000 will speedily increase them with our now increased and fast-increasing population to \$150,000,000. In proportion to population an expenditure of \$150,000,000 for the coming ten years is less than \$141,000,000 for the years in which that sum was expended. The appropriations made and proposed justify the belief that with our increase of population the average expenditure for the coming ten years will exceed the estimate I have made of \$150,000,000.

The annual expenditure for pensions for the next ten years will be at least \$73,000,000. The Commissioner proposes to adjust in the next three years claims for arrears and all claims now pending. This is not likely to be done in twice three years. And while the time of settlement may affect the annual expenditure, it will not change the average annual expenditure for ten years, or my estimate

of \$73,000,000 per annum during that period. The 3½ per cent. bonds, payable whenever we have the money to pay them, and the \$250,000,000 of 4½ per cent. bonds, payable September, 1891, amounted January 1, 1882, to \$801,186,800. To pay off this part of the debt when it is payable, in September, 1891, and to pay the annual interest on the entire debt, allowing for payments made since January last, will require an annual payment of \$130,000,000. The annual payment on account of the public debt for the past twelve years has been about \$160,000,000.

Taking the \$130,000,000 for annual payment on account of the public debt, the \$150,000,000 estimated for ordinary expenditures, and the \$73,000,000 for pensions, and we have as the required annual demand on the Treasury and the resources of the country for the coming ten years the sum of \$353,000,000.

The estimate of the revenues for this fiscal year, made by the Treasury Department, is \$400,000,000. The honorable chairman of the Ways and Means [Mr. KELLEY] estimates this year's receipts at \$405,000,000. These estimates are based on an estimated increase of \$20,000,000 over the receipts of last year from internal revenue, and a like increase of \$20,000,000 from customs duties. The receipts for the past eleven months of the year do not justify the estimates for internal revenue by nearly \$10,000,000, while the customs receipts but a little exceed the estimates from that source, and the revenue for the year will be much nearer \$393,000,000 than \$405,000,000.

It will thus appear that the claim that we have a surplus of any such sum as \$135,000,000 is made unadvisedly.

Beginning with the year 1892, when I trust there will only remain to be paid the \$739,347,800 of 4 per cent. bonds, it will require a yearly payment of \$67,000,000 to pay off this remaining part of the public debt at the time it is payable in 1907, now twenty-five years distant.

The payment of pensions will decline from \$55,000,000 in 1892 to \$23,000,000 in 1907 if no new classes are added other than soldiers of the Mexican war after arrears are adjusted. But those who suffered in prison will soon be added, and before the expiration of the twenty-five years all surviving soldiers will be added to the pension-roll. Whoever is here to make appropriations in the Sixtieth Congress will find a pension-roll demanding more than \$50,000,000. The average annual payment of pensions for the fifteen years from 1892 until 1907 will certainly not be less than \$50,000,000. At the commencement of that period in 1892 we shall have a population of 67,000,000, with ordinary expenditures at about \$170,000,000. At the end of that period in 1907 our population will number 96,000,000, and our ordinary expenditures may be set down at \$250,000,000. We may therefore safely estimate the average annual expenditure at not less than \$210,000,000, and these several sums together give us as the average annual disbursement of the Government for the fifteen years from 1892 to 1907 the sum of \$327,000,000. The disbursements of the Government are not likely ever again to be less than \$300,000,000, for with our growth of population the ordinary expenditures will amount to that sum when the debt is paid and the soldiers rest.

These are estimates, not of what the ordinary expenses of administration ought to be, but of what they will be. Gentlemen inclined to the belief that they are too high forget that with all our wonderful progress we have learned nothing in economy of administration. Just why ordinary expenditures can rightly outgrow population as they do under the one same frame-work of government is one of the many things I have never been able to understand. Mr. Buchanan's administration was driven from power for alleged prodigality in public expenditures, which were less than \$2.25 to the person. When General Grant was President and General Garfield at the head of the Appropriation Committee the cost of administration exceeded \$3 to the person for ordinary expenditures. In 1880, when the appropriations were made by a Democratic Congress and the Hayes administration had been frightened by the methods of its accession to power into a moderately decent use of the public moneys, expenditures were still \$2.50 to the person—10 per cent. higher than in Mr. Buchanan's time. The estimates I have submitted of future expenditures are not excessive.

I know it has been said here, and in parts of the country it is still insisted, that we must at an early day discontinue for a long series of years payments in reduction of the public debt, because of the high rate of premium on bonds (not due) not payable. Because, in other words, it is insisted that it will cost us more to so continue payments in reduction of the debt, premium included, as to pay it off at the time the longest bond is payable, in 1907, than it will cost if we make no payments on these bonds until that date when payments may be resumed without premium.

This sir, is an entirely mistaken view. The annual reduction of the debt by continual annual payments in the spirit of the law creating a sinking fund is at once the legal and the least expensive method of payment. The mistaken impression to the contrary is, I think, the result of errors in statements of the honorable Chairman of the Ways and Means Committee, [Mr. KELLEY,] who in the enthusiasm of debate and discussion sometimes so overstates or understates facts as to convert them into misstatements, which do injury to the country, injustice to his friends, and wrong to himself. In the debate on the "knot-goods" bill he stated the capital invested to be \$200,000,000, which is twelve times the amount actually invested, and he overstated by four or five times the number of persons engaged in the industry.

In his attempt to justify the tariff commission and the refusal of its advocates to intrust the work of tariff revision to him after twenty years of distinguished service, to which he came from the bench with a trained judicial mind, he made some criticisms of the tariff bill which I presented in the Forty-fourth Congress, as evidence of incompetency to treat the subject. His criticisms were not warranted by the facts, though the bill could hardly be faultless.

Mr. KELLEY. Will the gentleman allow me to say that I do not believe I used that word, or anything implying it; for I have the highest respect for the ability of my predecessor as chairman of the Committee on Ways and Means.

Mr. MORRISON. I will revise my remarks into a better speech than I am making and will state what the gentleman from Pennsylvania did say. He said in evidence, if not of my incompetency in evidence of the incompetency of Congress to frame a tariff bill, that in the bill reported by me acetate of potash, prussian blue, and may be other articles, appeared twice—once on the free list, and again sometimes under another name among articles paying a duty—and then he found an "s" at the end of the word chloroform, which disturbed him much.

If the gentleman had told the whole truth he would have said that the articles which appeared twice, once taxed and again on the free list, were by me placed on the free list, and that he and other gentlemen of the committee by his and their votes, not by mine, restored these articles to the taxable list and so they appeared twice. That they were not erased from one list when transferred to the other was a mere clerical omission, may be mine, and this the gentleman parades as evidence that the United States Congress is incompetent to frame a tariff bill.

Mr. KELLEY. I hope the gentleman will allow me to interrupt him for one moment, to make the suggestion that when he comes to write out his speech, as he says he proposes to do—

Mr. MORRISON. That I show it to you. [Laughter.]

Mr. KELLEY. That he will not be too modest to say what I said on that occasion, that the bill of the gentleman, though a pretty bad one, was very much better than the bill reported by the committee. I hope the gentleman will not fail to put that in.

Mr. MORRISON. I will not, and I will not fail to put in the fact that you helped to make it worse. [Laughter.]

Mr. KELLEY. I think it possible that when I saw the blunders that were being made I did not put my head in the way of preventing it.

Mr. MORRISON. No; you made a speech to some Southern gentlemen on that committee, talked about protecting the interests of Georgia, and got them to put these articles on the dutiable list, which were not erased from the free list.

Mr. KELLEY. On that particular committee there was no Representative from Georgia.

Mr. MORRISON. Except BEN HILL.

Mr. KELLEY. And he never became captivated with iron, as his successors did.

Mr. MORRISON. Oh, you could captivate anybody; you captivated him with quinine. [Laughter.] Then you were assuring everybody that to leave quinine where I placed it, on the free-list, with free alcohol for its manufacture, would bankrupt the home manufacturer, leave laboring people without employment, give a monopoly to the foreign producer, and ultimately raise the price of quinine.

Mr. KELLEY. I never captivated you.

Mr. MORRISON. No, you did not; it would trouble you to do that, though you know how much I think of you. [Laughter.]

Now, sir, returning to the cost of paying the 4 per cent. bonds. Beginning when the four-and-a-half bonds are payable and paid, if we reduce the 4 per cent. debt by equal annual payments, the 4 per cent. bonds will be paid when payable with \$1,252,047,915, including \$44,446,525 premium on a basis of a 3 per cent. rate of interest on Government securities. If when the 3½ and 4½ per cent. bonds are paid, we then discontinue payments for fifteen years and ten months, until the 4 per cent. bonds may be paid without a premium, the interest to be paid after that period will exceed the premium required for their earlier payment more than \$250,000,000, which is the cost of postponing payment to avoid the premium.

It will be said that the rate of interest to be realized from Government securities may be less than 3 per cent., which will increase the premium to be paid on the 4 per cent. bonds. Some comparatively small part of the public debt, possibly as much as \$200,000,000, for use in such purposes as call loans, may be taken at a rate as low as 2 per cent., but the investment rate will not be considerably less than 3 per cent. The present low rate of interest as indicated by the high premium on Government securities is the result of the present condition and requirement of the national banking system, a condition which cannot last.

Ten years hence, when we begin payment of 4 per cent. bonds, our coin and paper circulation, now nearly \$1,500,000,000, will with the increased population grow to something like \$1,800,000,000, half of it paper. The national banking system will have so grown upon the people that it will not then still rest upon the remaining portion of the public debt, then in the process of reduction by monthly payments. Some new security or national guarantee will have been provided as a basis for the banking system of the country, and the premium on 4 per cent. bonds will be lowered.

Gentlemen who would pay more than \$200,000,000 interest professedly to save less than \$45,000,000 in premiums, and who talk of new funding schemes, either forget or would have others forget that no funding scheme will avoid payment of premiums.

The bill under consideration and amendments proposed look to the speedy abolition of the internal-revenue system. In fact, the honorable chairman [Mr. KELLEY] and his Democratic colleague [Mr. RANDALL] have candidly declared their purpose to remove all internal-revenue taxes. These, it is said, are war taxes and ought to be removed because the war is over. It is just a little singular that those who clamor most for the abatement of war taxes never ask for any reduction in war taxes from customs, of which we are paying \$100,000,000 a year on sugar, clothing, and other necessities. Sir, much more than half the debt at the close of the war remains to be paid, and more than three-fourths of the cost of the war in pensions remain to be paid. It will require \$2,300,000,000 to pay the public debt yet to be paid, and interest, and at least \$2,000,000,000 for pensions. These are war taxes.

It is insisted that the internal revenue is an undemocratic tax. This means, if it means anything, that it is not undemocratic to maintain a permanent public debt, for if the debt is to be paid a considerable revenue from internal taxation is a necessity.

So intelligent and respectable a body as the National Board of Trade, whose president is an eminent business man of Philadelphia, has declared all internal taxes war taxes and anti-republican in time of peace. It does not appear to have occurred to the National Board of Trade that it is either undemocratic or anti-republican to maintain a war tax of 50 to 100 per cent. on window-glass, iron and steel, wool hats, carpets, and clothing, and other highly war-taxed articles of chief product in the grand old Commonwealth of Pennsylvania, yielding bounties to her capitalists equivalent to the rate of war taxes.

I have already shown that to pay the expenses of administration, pensions, and the public debt, when it is payable, will require a revenue of \$350,000,000 for ten years, and \$300,000,000 afterward. If we pay nothing in reduction of the debt, the cost of administration increased by the payment of pensions and interest on the public debt will require a revenue exceeding \$280,000,000 per annum for the next ten years. All propositions, therefore, looking to the total abolition of internal taxes are simply absurd.

The CHAIRMAN. The time of the gentleman has expired.

Mr. HOLMAN. I hope the time of the gentleman will be extended.

Mr. KELLEY. I trust there will be no objection.

Mr. MORRISON. I shall want but a few minutes more.

The CHAIRMAN. The Chair hears no objection to the extension of time.

Mr. MORRISON. Something has been said of the reductions of taxes since the war. More taxes have been laid on than have been taken off since the war. The taxes taken off yielded revenue to the Treasury, while the taxes laid on give bounty to capital invested in manufactures. The present high rate of taxation ought not to be maintained. Both customs duties and internal taxes should be reduced. We can revise and adjust our system and dispense with all internal-revenue taxes except taxes on tobacco and spirits, and these should be fixed at revenue rates.

We must have revenue from some source through taxation. Taxation is privation. To tax property is to take part of it. Every consideration of private right and public policy demand that the Government should take from the citizen a part of those things he can best spare. He can better spare a part from his whisky and tobacco than all from his food, clothing, and other necessities and comforts of life.

Whatever may be the ultimate policy of the Government as to the sources of its revenue, we require both internal and tariff taxes until the public debt is paid. It must be paid. It corrupts administration, adds to the cost of living, and has been fitly called a moral canker. It is always owned by the few.

In practice the law creating a sinking fund for the yearly reduction of the debt has applied to that purpose the annual surplus. The execution of the law would extinguish the entire debt when it is payable, in 1907. That is the contract. Had we fallen upon national adversity and the rate of interest been increased, we would be classed as breakers of the public faith if we failed to reduce the debt as provided by the sinking-fund act. Now that the rate of interest has fallen, we must not postpone payment in the interest of the holders of public securities by repealing the internal-revenue laws.

In connection with the proposed abolition of all internal taxes there is another view of the subject to which I desire to call the attention of Congress and the country. We derive a considerable revenue from imported fruits, books, salt, leather, and fancy goods, but it is chiefly from duties on cottons, woollens, flax, silk, iron, steel, spirits, wine, tobacco, and sugar that we derive customs revenue. Three-fourths of all we receive are paid on these. The articles of sugar and molasses alone pay about one-fourth of all we receive from tariff revenues; and as to most of the others the productive power of our own country is nearly equal to the wants of our people. We can produce all we use; we can control and supply our own markets. With a revenue tariff there are but few things which can be imported with profit.

Whatever our policy may be as to tariff, whether for revenue, for

protection, or professedly for both, our income from most of the articles which have been our chief source of supply must fall off. It may be true that an ever-growing people acquire new tastes and have new wants to be supplied, thus giving new life to commerce and multiplying exchanges among neighboring and may be distant nations. Such new wants are likely to be in the direction of luxuries enjoyed by the few, and it must be always remembered that it is the multitude that pay taxes, especially taxes from customs, which are chiefly derived, not from luxuries enjoyed by the few, but from the necessities and comforts of the common people. I submit, therefore, in view of present conditions, that prudent statesmanship forbids the entire abolition of internal-revenue taxation.

Mr. Chairman, I am speaking not without consideration of this subject, but without previous thought as to the order of its presentation. I ask, therefore, that I may revise my remarks and append some estimates kindly prepared at my request by Professor Elliott, the Government actuary, and General Dudley, Commissioner of Pensions. The estimate of the Commissioner for pensions to soldiers of the late war are based on existing pension laws, and on the belief that claims for arrears and other claims filed and to be filed up to that time will be adjusted before June 30, 1888.

A.

UNITED STATES TREASURY DEPARTMENT,
Washington, D. C., March 13, 1882.

SIR: You request of me a statement of the constant annual payment required to meet the interest on the interest-bearing debt of the United States and to extinguish the principal of the 3½ per cent. and the 4½ per cent. securities of the United States by the 1st of September, 1891, the date when the latter-mentioned securities become redeemable—a period of nine years and eight months from January 1, 1882; also, the number of years required to call in and extinguish the 3½ per cent. securities, assuming these to be the earlier paid; also, a statement of the constant annual payment required to be made after the 1st of September, 1891, to meet the interest on the public debt of the United States still outstanding, and to extinguish the principal of the outstanding 4 per cent. securities by the 1st of July, 1907, the date when these securities become redeemable—a period of fifteen years and ten months from the 1st of September, 1891; also, a statement of values corresponding to the above, but computed on the assumption that from and after the extinguishing of the 3½ per cent. securities the rate to be realized by the United States Government on its investments and reinvestments will be 3 per cent. per annum instead of at par; also, a statement of the average annual expenditures of the United States Government for the last twelve years for the payment of interest and in reducing the public debt; also, a statement of the net premium each year which the 4½ and the 4 per cent. securities of the Government should command in open market, on the assumption that the rate of interest to be realized by investors in the securities of the United States will be 3 per cent. per annum.

In response to your inquiries, I have the honor to submit the accompanying tables and comments:

B.

PRELIMINARY STATEMENT.

Statement of the interest-bearing debt of the United States outstanding on the 1st day of January, 1882—principal and interest.

	Principal.
Sixes continued at 3½ per cent.	\$149,682,900
Fives continued at 3½ per cent.	401,503,900
Total continued fives and sixes.	551,186,800

Securities.	Principal.	Interest payable each year.
Total 3½ per cent.	\$551,186,800	\$19,291,538
Total 4½ per cent.	250,000,000	11,250,000
Total 4 per cent.	739,347,800	29,573,912
Total 3 per cent.	14,000,000	420,000
Total interest-bearing	1,554,534,600	60,535,450

The total interest payable each year on the interest-bearing debt now outstanding averages 3½ (more exactly 3.8941) per cent. of the interest-bearing portion of the outstanding indebtedness.

TABLE I.—Showing, by years, the sinking-fund payment required to be made by the Government to extinguish the principal of its optional 3½ per cent. securities, (\$551,186,800,) and that of its 4½ per cent. securities (\$250,000) during the period from January 1, 1882, to the date when the four-and-a-halfs become redeemable, September 1, 1891; assuming that, after the 3½ per cent. securities are extinguished investments are to be made at par in the Government 4½ per cent. securities.

[The computed period from January 1, 1882, to extinguishment of the 3½ per cent. securities, 7.0144 years.]

Date.	Aggregate amount of payments proposed to reduce the principal of the public debt from January 1, 1882, to the dates specified.	Annual payments to reduce the principal of the public debt during the years following the dates specified.
January 1, 1882		\$70,688,600
January 1, 1883	\$70,688,600	73,161,700
January 1, 1884	143,850,300	75,724,300
January 1, 1885	219,574,600	78,373,000
January 1, 1886	297,947,600	81,116,300
January 1, 1887	379,063,900	83,956,200
January 1, 1888	463,620,100	86,893,400
January 1, 1889	549,913,500	90,785,300
January 1, 1890	640,698,800	94,877,000
January 1, 1891	735,575,800	65,611,000
September 1, 1891	801,186,800	
7.0144 years after January 1, 1882, or 5½ days after January 1, 1889.	551,186,800	

Outstanding January 1, 1882:

Three-and-a-halfs	\$551,186,800
Four-and-a-halfs	250,000,000

Together

801,186,800

TABLE II.—Showing the constant amount required each year from January 1, 1882, to pay the interest as it accrues on the entire outstanding public debt, and to extinguish the principal of the 3½ per cent. securities and that of the 4½ per cent. securities by September 1, 1891, the date when the latter become by law redeemable, assuming that after the 3½ per cent. securities are called in and paid investments may be made at par in the 4½ per cent. securities.

Calendar year commencing January 1—	Principal to be reduced each year.	Interest payable each year.	Total payment each year for interest and reduction of principal.
1882	\$70,688,600	\$60,535,450	\$131,224,050
1883	73,161,700	58,682,350	131,224,050
1884	75,724,300	55,499,750	131,224,050
1885	78,373,000	52,821,050	131,224,050
1886	81,116,300	50,107,750	131,224,050
1887	83,956,200	47,267,850	131,224,050
1888	86,893,400	44,330,650	131,224,050
1889	90,785,300	40,438,750	131,224,050
1890	94,877,000	36,347,050	131,224,050
1891, (two-thirds of year from January 1, to September 1)	65,614,000	21,868,700	87,482,700

C.

TABLE III.—Sinking-fund payments to extinguish the principal of the \$739,347,800 outstanding 4 per cent. United States debt redeemable in 1907, payments to commence with the extinguishment of the 4½ per cent. bonds redeemable September 1, 1891, assuming interest to be reinvested at the rate of 4 per cent. per annum.

Date.	Aggregate amount of payments proposed to reduce the principal of the public debt from Sept. 1, 1891, to the dates specified.	Amount to reduce the principal of the public debt during the period immediately following the date specified.
September 1, 1891		\$11,303,000
January 1, 1892	\$11,303,000	34,809,300
January 1, 1893	46,112,300	36,201,900
January 1, 1894	82,314,100	37,649,700
January 1, 1895	119,963,800	39,153,800
January 1, 1896	159,119,600	40,722,000
January 1, 1897	199,841,600	42,350,600
January 1, 1898	242,192,400	44,045,000
January 1, 1899	286,239,400	45,806,700
January 1, 1900	332,044,100	47,638,900
January 1, 1901	379,683,000	49,544,600
January 1, 1902	429,227,600	51,528,300
January 1, 1903	480,753,900	53,587,400
January 1, 1904	534,341,300	55,730,800
January 1, 1905	590,072,100	57,960,100
January 1, 1906	648,032,200	60,278,500
January 1, 1907	708,310,700	131,437,100
July 1, 1907	739,347,800	

* Four months. † Six months.

TABLE IV.—Showing by years the amount of the payments required during the fifteen years and ten months elapsing from 1st of September, 1891, the date when the 4½ per cent. securities of the Government are redeemable, to the 1st day of July, 1907, when the 4 per cent. securities are redeemable, in order to extinguish the principal of the 4 per cent. indebtedness outstanding January 1, 1882, and to pay the interest on the public debt as it accrues, assuming payments to be invested at the rate of 4 per cent. per annum.

Periods.	Proposed reduction of principal during each period specified.	Interest payable each period specified.	Total payment period for interest and reduction of principal.
September 1, 1891, to January 1, 1892	\$11,303,000	\$10,147,373	\$21,450,400
Entire calendar year:			
1892	34,809,300	29,541,800	64,351,100
1893	36,201,900	28,149,300	64,351,100
1894	37,649,700	26,701,400	64,351,100
1895	39,153,800	25,195,300	64,351,100
1896	40,722,000	23,629,100	64,351,100
1897	42,350,600	22,000,300	64,351,100
1898	44,045,000	20,306,100	64,351,100
1899	45,806,700	18,544,400	64,351,100
1900	47,638,900	16,712,200	64,351,100
1901	49,544,600	14,800,500	64,351,100
1902	51,528,300	12,824,800	64,351,100
1903	53,587,400	10,763,700	64,351,100
1904	55,730,800	8,620,300	64,351,100
1905	57,960,100	6,301,000	64,351,100
1906	60,278,500	4,072,600	64,351,100
1907, (one-half year, to July 1)	31,037,100	1,188,500	32,175,600

TABLE V.—Statement showing the net reduction of the public debt and interest paid during the twelve fiscal years from June 30, 1869, to July 1, 1881.

Fiscal year—	Annual reduction.	Interest paid.
Ending June 30, 1870.....	\$102,643,880 84	\$129,235,408 00
Ending June 30, 1871.....	94,327,764 84	125,576,565 93
Ending June 30, 1872.....	100,544,491 28	117,357,839 72
Ending June 30, 1873.....	43,667,630 05	104,750,688 44
Ending June 30, 1874.....	4,730,472 41	107,119,815 21
Ending June 30, 1875.....	14,399,514 84	103,093,544 57
Ending June 30, 1876.....	29,249,318 33	100,243,271 23
Ending June 30, 1877.....	39,281,121 73	97,124,511 58
Ending June 30, 1878.....	24,371,391 44	102,590,874 65
Ending June 30, 1879.....	8,579,575 45	105,327,949 00
Ending June 30, 1880.....	85,034,961 03	95,757,575 11
Ending June 30, 1881.....	101,573,483 36	82,508,741 16
Totals.....	648,403,668 60	1,270,596,784 62
Annual average during the twelve fiscal years ended June 30, 1881.....	54,033,639 05	105,883,065 38

Showing that during the twelve fiscal years ended June 30, 1881, the average annual expenditure for the net reduction of the public debt and for payment of interest has been \$100,000,000; more exactly, \$159,916,704.43.

TABLE VI.—Premium, not including accrued interest, on United States 4½ per cent. bonds redeemable (and considered as payable) September 1, 1891, and on United States 4 per cent. bonds redeemable (and considered as payable) July 1, 1907; assuming interest to be reinvested quarterly, and 3 per cent. per annum to be the rate to be realized by investors.

FOUR AND A HALF PER CENT. BONDS OF 1891.

September 1—	Premium paid per \$100 invested.	September 1—	Premium paid per \$100 invested.
1881.....	\$12.918	1887.....	\$5.634
1882.....	11.793	1888.....	4.288

1893.....	11.731	1907.....
1894.....	10.732		

D.

By inspection of the foregoing tables it will be seen that an annual payment of \$131,224,050—if applied to the payment of the interest on the public debt, and to the calling in of the 3½ per cent. bonds until extinguished, and then to the purchase at par of the 4½ per cent. bonds—will cancel the interest as it accrues on \$1,554,534,600, the entire interest-bearing portion of the public debt outstanding January 1, 1882; and will, moreover, extinguish the \$551,186,800 principal of the 3½ per cent. and the \$250,000,000 of 4½ per cent. indebtedness by the date of the maturity or redeemability of the latter, September 1, 1891, the \$551,186,800 of 3½ per cent. debt becoming extinguished in seven (more exactly 7.0144) years from that date.

An annual sum of \$64,351,100 applied to the payment of the interest on all the remaining interest-bearing portion of the public debt, and to investment at par in the 4 per cent. securities of the Government, would cancel the interest as it accrued and would extinguish the 4 per cent. indebtedness of \$739,347,800 by July 1, 1907, the date of maturity or redeemability.

After the extinguishing of the three-and-a-halves, the four-and-a-halves, and the fours, there will yet remain a 3 per cent. debt of small amount (\$14,000,000) of peculiar character, and known as the Navy pension fund. This debt is not likely to be increased or reduced.

If, after the extinguishing of the 3½ per cent. securities of the Government, the 4½ per cent. and the 4 per cent. securities cannot be obtained in the open market at par somewhat larger annual payments than those given in the foregoing tables will be required in order that these securities may each be extinguished at the date respectively when by law redeemable.

If it be assumed that after the calling in of the 3½ per cents only 3 per cent. per annum can be realized by the Government on its reinvestments of interest, the constant sum to be paid each year for interest on the outstanding public debt and

to liquidate principal of the three-and-a-halves and four-and-a-halves would be \$131,800,750 instead of \$131,224,050, and the corresponding period to the extinguishing of the 3½ per cents will be somewhat less than seven years, to wit, 6.9639 years; and the constant sum to be paid each year for interest on the then outstanding public debt and to extinguish the principal of the 4 per cent. securities would be \$67,158,250 instead of \$64,351,100.

A table is given showing the net premium which each of the securities (the four-and-a-halves and the fours) would command in the market each year to redemption or maturity on the assumption that the normal rate of interest, or rate to be realized to the investor in the securities of the United States, will continue to be, as now and for many months past, 3 per cent. per annum.

It will be observed that the rate of premium steadily becomes less as the bond approaches maturity.

A table is also given showing the net reduction of the public debt and the interest paid during each of the twelve fiscal years from June 30, 1869, to July 1, 1881.

The annual average reduction of the debt during these twelve years was fifty-four millions dollars, (\$54,033,639.05.) and the average annual payment of the interest was one hundred and six million dollars, (\$105,883,065.38.) the average annual expenditure for these two objects having been one hundred and sixty million dollars, (\$159,916,704.43.)

Respectfully,

E. B. ELLIOTT, Government Actuary.

Hon. WILLIAM R. MORRISON, M. C.

POPULATION.

TREASURY DEPARTMENT,
Washington, D. C., March 18, 1882.

DEAR SIR: I have the honor to inclose herewith, in accordance with your oral request, an estimate by me of the probable population of the United States (including Territories) for the 1st of June of the years 1890, 1891, 1900, 1907, and 1910 respectively:

Population of the United States enumerated and estimated.

June 1, 1880, (enumerated).....	50,153,000
June 1, 1890, (estimated).....	64,476,000
June 1, 1891, (estimated,) [4½ per cent. bonds payable in this year].....	60,181,000
June 1, 1900, (estimated).....	81,529,000
June 1, 1907, (estimated,) [4 per cent. bonds payable in this year].....	95,380,000
June 1, 1910, (estimated).....	101,310,000

Respectfully,

E. B. ELLIOTT, Government Actuary.

Hon. WILLIAM R. MORRISON, M. C.,

House of Representatives.

EXPENDITURES ON ACCOUNT OF PENSIONS.

DEPARTMENT OF THE INTERIOR, PENSION OFFICE,
Washington, D. C., January 19, 1881.

SIR: I have the honor to forward herewith certain estimates of probable expenditures on account of pensions, for a period of twenty-five years, based on a proposition submitted by Hon. W. R. MORRISON, of the Ways and Means Committee, House of Representatives, which I deem it proper to submit for your consideration and transmission to Mr. MORRISON.

The proposition is presented at the head of the exhibit, and was submitted to me informally by Mr. MORRISON, who desired this information in the interest of public legislation which might come before his committee.

It is proper to make a statement inviting attention to assumed facts carrying unknown quantities, presented in the proposition, so that any estimate made must of necessity be very largely problematical.

I am, sir, very respectfully,

WM. W. DUDLEY, Commissioner of Pensions.

Hon. S. J. KIRKWOOD,
Secretary of the Interior.

PROPOSITION: If all the claims for pensions arising from the war of the rebellion shall be adjudicated within the seven-years' period terminating June 30, 1888, and if, at the end of that period, the survivors of the war with Mexico and their widows shall then be pensioned, what appropriations will be required annually to pay pensions during the next twenty-five years?

June 30, 1881, there were 268,830 names on the pension-roll and their annual value was \$28,769,967.46; or a general average value to each pensioner of \$107.01.

During the fiscal year ending with that date, the average amounts of accrued pension paid to pensioners, as first payments, were as follows: to Army invalids, \$953.62; to Army widows, dependent relatives, &c., \$1,021.51.

This accrued pension is payable only in claims filed prior to June 30, 1880. At that date there were on file 238,224 original invalid, and 71,801 original widows', &c., claims. Of these claims, during the fiscal year next ensuing, 21,143 invalid and 3,719 widows', &c., claims were allowed, leaving 217,081 invalid and 68,082 widows', &c., pending June 30, 1881, in which accrued pension is due if allowed.

An analysis of the files made during the current year shows that 31,119 of the invalid and 22,014 of the widows', &c., claims have been rejected and abandoned. Deducting the numbers settled adversely from the numbers pending as above stated, leaves 185,962 invalid and 45,068 widows', &c., claims to be adjudicated within the seven-years' period stated in the proposition.

Adopting the estimate embodied in the President's message as to the per cent. of claims which it is expected will be hereafter rejected (15 per cent.) it follows that of the 185,962 live original invalid claims pending June 30, 1881, 158,068 will be allowed, and 27,894 rejected, and of the 45,068 live original widows' claims then pending 38,308 will be allowed, and 6,760 rejected.

The amounts of their first payments, and thereby the annual appropriations required, will be dependent upon the rapidity of their adjustment. If settled in equal numbers each year during the seven years, the numbers allowed annually would be 22,581 and 5,472 of the respective classes. In fact, however, during the earlier years of the period, the claims sustained by the record evidence, those which are free from complications, and in which the parole testimony is easily obtainable by the claimants, would be adjudicated; leaving over for the later years the more difficult cases.

The proportion of allowances during each year may be approximately represented by the arithmetical series 10, 10, 10, 9, 8, 7, 6; and upon this assumption, the number of claims to be allowed during each year may be stated as follows:

Years.	Invalid.	Widows, &c.
First.....	26,345	6,385
Second.....	26,345	6,385
Third.....	26,345	6,385
Fourth.....	23,710	5,746
Fifth.....	21,076	5,168
Sixth.....	18,440	4,469
Seventh.....	15,807	3,830

As before stated, the average amount of accrued pension payable upon each allowance June 30, 1881, was \$953.62, and \$1,021.51 to the respective classes of Army pensions. To these sums must be added the annual rate value of each pension to determine the average amount of accrued pension during each year of the septennial period, namely, invalids, \$108.02; widows, \$108.72.

Years.	Invalids.	Widows, &c.
First.....	\$953 62	\$1,021 51
Second.....	1,061 64	1,130 23
Third.....	1,169 66	1,238 95
Fourth.....	1,278 68	1,347 67
Fifth.....	1,386 70	1,456 39
Sixth.....	1,494 72	1,565 11
Seventh.....	1,602 74	1,673 83

To adopt these conclusions is to assume that the annual rate of each pension will remain as at present. It has slowly increased in the past, but in the absence of more definite figures, these may be accepted for the purposes of this calculation.

The rates given are the accrued values at the beginning of each year, while the allowances will be distributed through the years; hence, to the average accrued value of each pension must be added one-half the annual rate value of each allowance, as follows:

Years.	Invalids.			Widows, &c.		
	No. of claims.	Annual rates.	Totals.	No. of claims.	Annual rates.	Totals.
First.....	26,345	\$953 62	\$1,422,893	6,385	\$1,021 51	\$6,522,341
Second.....	26,345	1,061 64	1,422,893	6,385	1,130 23	7,216,518
Third.....	26,345	1,169 66	1,422,893	6,385	1,238 95	7,910,695
Fourth.....	23,710	1,278 68	1,280,577	5,746	1,347 67	7,743,711
Fifth.....	21,076	1,386 70	1,138,314	5,108	1,456 39	7,439,240
Sixth.....	18,440	1,494 72	1,095,044	4,469	1,565 11	7,003,476
Seventh.....	15,807	1,602 74	1,053,736	3,830	1,673 83	6,410,768

This embraces, it will be observed, only the accrued pension; i. e., the amounts payable as first payments. To these must be added the annual rate values of the roll, as follows:

Year.	Accrued pension.	Annual rate values.	Totals.
First.....	\$33,415,440	\$28,769,967	\$62,185,407
Second.....	36,955,404	32,309,929	69,265,333
Third.....	40,495,368	35,849,891	76,345,259
Fourth.....	39,654,142	39,389,853	79,043,995
Fifth.....	38,080,313	42,575,711	80,656,024
Sixth.....	35,794,980	45,407,679	81,202,659
Seventh.....	32,867,213	47,885,435	80,692,648

The annual rate value at the commencement of the eighth year would be \$50,009,303. These sums represent the gross additions to the roll growing out of the allowance of Army claims only, and do not embrace upon the one hand Navy pensions, service pensions, increased rates in progressive disability cases, special act pensions, restorations, costs of disbursements, &c., and upon the other hand no deductions have been made for losses to the roll by deaths, remarriages, legal limitation, or other causes.

During the last fiscal year the loss to the annual rate value of the roll from all causes was \$1,310,185.83, while the gain from the sources not embraced in the table last given was \$1,015,408.52, to which should be added the compensation to pension agents and their expenses for that year, (\$224,253.) making a total of \$1,239,661.52, or nearly a balance between gains and losses. Nor need we expect them to vary to any great extent during the next seven years. The largely increased number of allowances of invalid claims will add greatly to the gain from increased rates; the allowance of widows' service pensions will to a considerable extent offset the loss by the deaths of survivors of the old wars, of whom there are but 8,898 on the roll. The percentage of loss from deaths will increase somewhat, but that arising from legal limitation in minors' claims will nearly disappear, there now being but 4,333 claims representing that class upon the roll.

The losses by deaths, so far as reported during the last four fiscal years, have been as follows:

Year ending June 30,	Per cent.
1878.....	.9+
1879.....	.9+
1880.....	1.2+
1881.....	1.1+

It appears then, for the purposes of this calculation, the gains from the items omitted (which, if included, would complicate the subject exceedingly) may be accepted to equalize the losses from all causes; and if so, the annual value of the roll, at the beginning of the eighth year, so far as the claims filed prior to June 30, 1880, are concerned, will stand at \$50,009,303.

In addition thereto are the claims filed, and to be filed, after the date last named. During the fiscal year ending June 30, 1881, there were 18,455 invalid and 10,527 widows', &c., claims, of the Army class, filed.

It is, of course, impossible to estimate the number that will be filed in the future. It is not probable that the receipts will diminish to a very great extent during the next seven years. The number of invalid claims filed may grow less, but the widows', &c., claims will be likely to increase in number for some time to come. These pensions will commence from the date of filing the claims in the Pension Office.

From such consideration as has been given to this branch of the question under discussion, it is concluded that this class of claims will cause an addition to the annual rate value of the roll each year (except the first) of \$1,500,000; hence, at the close of the seventh year the annual rate value of the entire roll will be \$59,009,303.

During the fiscal years ending in 1879, 1880, and 1881 the losses to the roll from all causes were 5.5 per cent., 5.1 per cent., and 3.98 per cent., respectively.

Of the invalid and widows, &c., pensioners on the roll June 30, 1881, the proportions of those classes were respectively 67 per cent. and 33 per cent., while of the original claims then pending the proportions were 75 per cent. and 25 per cent.

While the losses to the entire roll, during the last three fiscal years, were as above stated, (5.5 per cent., 5.1 per cent., and 3.98 per cent.), the losses to the invalid branch of the roll, from all causes, was but 1.7 per cent., 2.2 per cent., and 1.7 per cent. during those years; hence the increased percentage of allowances to be made of the invalid branch, will affect—because of their relatively smaller ratio of loss—the natural increase in loss in the other branch arising from advance in age, &c.

It appears from the official publications of the War Department that the mean age of the soldiers enlisted during the war of the rebellion was twenty-six years; the mean year of that war was 1863; hence, in 1888, the average age of its survivors will be fifty-one years, and eighteen years later it will be sixty-nine years. The expectation of life of persons fifty-one years old is 20.39 years; of persons sixty-nine years old it is 9.70 years. At the intervening decennial periods it is stated as follows: fifty-five years, 17.58; sixty years, 14.34; sixty-five years, 11.79.

The statistics of mortality include both sexes, subject to the influences of ordinary conditions only, such as surround the soldier after his return home. What effect his exposure in the service may have upon his longevity is problematical. Those discharged for disability, it may be presumed, would not, as a class, have the same expectation of life as civilians; but a considerable proportion of persons thus discharged are pensioned for disabilities arising from wounds and injuries to the extremities and other non-vital parts, permanent in their nature, but not impairing the health of the subject. This class are men of tried physical endurance; the service eliminated those of weak constitutions, and developed all latent diseases, and they are superior physically to the classes embraced in mortality statistics. Only about one-third of the invalid pensioners are disabled by diseases.

From these and various other considerations, having in view the gains to the roll from the sources heretofore recited, it may be assumed that the annual net loss in value to the roll, after the adjudication of all the rebellion original claims filed within the seven years' limit, will not exceed 5 per cent. per annum.

Therefore, starting with an annual rate value of \$59,009,303 at the commencement of the eighth year, other conditions remaining the same, it would be annually thereafter as follows:

1888.....	\$59,009,303
1889.....	56,058,837
1890.....	53,255,896
1891.....	50,593,102
1892.....	48,063,447
1893.....	45,660,275
1894.....	43,377,262
1895.....	41,208,399
1896.....	39,147,980
1897.....	37,190,581
1898.....	35,331,052
1899.....	33,564,500
1900.....	31,886,275
1901.....	30,291,962
1902.....	28,777,364
1903.....	27,338,496
1904.....	25,971,572
1905.....	24,672,994
1906.....	23,439,345

These conclusions show a loss in value between the seventh and twenty-fifth years of 60 per cent., while according to mortality statistics but 41 per cent. of the ordinary classes of persons would die within that period. They are substantially in harmony with Commissioner Bentley's estimate that the future average duration of invalid pensions will somewhat exceed twenty-four years.

The proposition under discussion contemplates new legislation after the expiration of seven years, placing upon the pension-roll the names of the survivors of the war with Mexico, and of their widows.

The terms of the contemplated grant are not stated, but it may be assumed that they will be similar to those of like character relating to the war of 1812.

The following forces were employed in that war:

Regulars.....	26,922
Volunteers.....	73,280
General staff.....	272
Naval, (estimated).....	5,000
	105,454

Deductions for purposes of present calculation:

Deaths from all causes.....	12,896
Desertions.....	6,725
	19,621

Number honorably discharged..... 85,833

Further deductions:

Number pensioned from 1840 to 1861.....	6,525
Re-enlistments, (estimated).....	13,221
	19,746

Basis for pension estimates..... 66,087

As heretofore stated, the average age of the volunteers during the late war was twenty-six years. The same mean age is assumed for the soldiers in the war with Mexico. It was less, probably, inasmuch as only a small number were enlisted, and the first to volunteer are usually those free from domestic and business ties. The mean year of that war was 1847; forty-one years will have intervened between that date and 1888, at which time it is assumed these pensions will be granted. Then the average age of the survivors will be sixty-seven years.

Of 100,000 births, 58,360 attain the age of twenty-six years, and 27,771 attain the age of sixty-seven years. (See Encyclopedia Britannica, Annuities.) It follows of 58,360 persons twenty-six years of age, 30,589, or 52.4 per cent., will die before reaching their sixty-seventh year. Therefore, of 66,087 soldiers discharged from service in the war with Mexico for causes not disabling, the same ratio being observed, 34,629 will have deceased before 1889, and 31,458 will then survive.

It has been the experience of the Pension Office that of a class entitled to service pensions, a considerable number fail to apply, or having applied, from various causes fail to become pensioners. A liberal deduction upon this account, and to cover any excess in the foregoing estimate growing out of subsequent service during the war of the rebellion, or other unusual conditions, would be 16 per cent., or 5,772, leaving 28,857 as the probable number of survivor pensioners, under a provision of law granting the same to all who served, regardless of the periods of such service.

They might easily be placed upon the roll within the two years next following the passage of the law; say 20,000 the first year and the remaining 8,857 during the second year.

Of the 454,054 enlistments for more than fourteen days' service (pensionable period during the war of 1812) there were 8,898 survivors on the roll June 30, 1881; their average age is greater than will be that of the survivors of the war with Mexico twenty-five years hence. Deducting 10 per cent. for re-enlistments of the same soldier, and it appears that 2.1 per cent. of the soldiers of that war survive. If

the same proportion of deaths occur then, at the close of the twenty-five years period, but 605 names of the survivors of the war with Mexico will remain upon the roll; an average annual loss to the roll of 1,765 names. At \$96 each per annum the additions to the annual appropriations on this account will be as follows:

1888.....	\$1,920,000	1897.....	\$1,414,224
1889.....	2,770,272	1898.....	1,244,713
1890.....	2,600,766	1899.....	1,075,212
1891.....	2,431,260	1900.....	905,706
1892.....	2,261,754	1901.....	736,200
1893.....	2,092,248	1902.....	566,694
1894.....	1,922,742	1903.....	396,188
1895.....	1,753,236	1904.....	227,682
1896.....	1,583,730	1905.....	58,176

To estimate the number of widows to be pensioned under the proposed law is more difficult. The number of survivors in 1888 has been stated as 31,548, and the number who were discharged—having a pensionable title—as 66,087; therefore, the widow claimants must have been the wives of the persons representing the difference between those numbers, or 34,629 soldiers.

In addition thereto, there will be the widows of those survivors who die after becoming pensioners, and to whose title their widows will succeed. Of course a considerable portion of these soldiers have not left, and will not leave widows; but these widow pensioners will be found to be much younger than the soldiers. It is concluded that the annual cost to the roll on their account will about equal that on account of the survivor pensioners, with perhaps a somewhat dissimilar distribution of that cost in the different years, but insufficient in amount to disturb this calculation.

Therefore, the sums last stated being doubled, and combined with those estimated as chargeable to the rebellion claims gives the following results:

Years.	Rebellion claims filed prior to June 30, 1880.	Rebellion claims filed after June 30, 1880.	Mexican war claims.	Totals.
1881.....	\$62,185,407			\$62,185,407
1882.....	60,265,333	\$1,500,000		70,765,333
1883.....	76,345,259	3,000,000		79,345,259
1884.....	79,043,985	4,500,000		83,543,985
1885.....	80,656,024	6,000,000		86,656,024
1886.....	81,202,669	7,500,000		88,702,669
1887.....	80,692,648	9,000,000		89,692,648
1888.....	59,009,303		\$3,840,000	62,849,303
1889.....	56,058,837		5,540,544	61,599,381
1890.....	53,255,896		5,201,532	58,457,428
1891.....	50,593,102		4,862,520	55,455,622
1892.....	48,063,447		4,523,598	52,586,955
1893.....	45,660,275		4,184,496	49,844,771
1894.....	43,377,262		3,845,484	47,222,746
1895.....	41,208,399		3,506,472	44,714,871
1896.....	39,147,980		3,167,460	42,315,440
1897.....	37,190,581		2,828,448	40,019,029
1898.....	35,331,052		2,489,436	37,820,488
1899.....	33,564,500		2,150,424	35,714,924
1900.....	31,886,275		1,811,412	33,697,687
1901.....	30,291,962		1,472,400	31,764,362
1902.....	28,777,364		1,133,388	29,910,752
1903.....	27,338,496		792,376	28,130,872
1904.....	25,971,572		455,364	26,426,936
1905.....	24,672,994		116,352	24,789,346
1906.....	23,439,345			23,439,345
Totals.....	1,264,220,977	31,500,000	51,921,616	1,347,651,593

Maryland and Delaware Free Ship-Canal.

SPEECH

OF

HON. FETTER S. HOBLITZELL,

OF MARYLAND,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, July 25, 1882,

On the bill (H. R. No. 6242) making appropriations for the construction, repair, and preservation of certain works on rivers and harbors.

Mr. HOBLITZELL said:

Mr. SPEAKER: The theory of our Government in its practice hinges upon the trite aphorism "of the greatest good to the greatest number," and the legislation of Congress should be formulated and enacted with the general benefit and advantage to result to the great body of the whole people primarily in view, if the power of the Union is to be permanently builded up to its fullest proportions of greatness.

Early in the history of the country, owing to the limited means of interstate communication, the producing power of the people both in agricultural and manufacturing industries was necessarily limited. Deprived of a market for the want of convenient means of transportation, the greatest interest was manifested by the fathers of the Constitution in the proper development of means of intercourse between the States; not merely for the material results to flow in the additions to the wealth of the country, but with the broader object of strengthening the bonds of our unity and guaranteeing the perpetuity of those glorious free institutions for which so much precious blood and treasure had been expended.

XIII—473

Accordingly, we find upon appeal to the record of the past, as expressed in the addresses, messages, and writings of our great public men, an unbroken line of testimony of these statesmen of America, from Washington, Adams, and Jefferson to the present generation, favoring by governmental action the development and the improvement of our great natural advantages in the opening of a thorough system of transportation highways for the country, which were to distribute the rich products of the several States among each other, build up our foreign commerce, and open up fresh avenues of trade and business by short routes to the ocean; in the establishment of a wise policy of reaching out our arms for the values of the civilized world in exchange for those of our country.

This policy, while expressing sound business principles, was the outpouring of a pure and disinterested patriotism that saw in the rapidly aggregating wealth of all the States—its certain fruits—the secret ties of interest, which, more than all other motives, was to cement the bonds of our Union indissolubly. Sir, reposing in the sunshine of peace and prosperity, we are happy and contented with the glorious memories of the struggle of our fathers for liberty and independence which cluster around the history of America as the throbbing wealth of stars glittering in the heavens; but even these are forgotten when our material interests are assailed; and reckless of it all, proud and glorious as those common memories of courage, of heroism, and patriotism are, we have lived to witness, before time had rung out the first century of our existence, "grim-visaged war" bare its red arm to shed the blood of kinsmen and friends in bitter civil strife, whose frightful wounds never will be healed while lives the memory of the victor and the vanquished. And so I am led captive in admiration of the wisdom and statesmanship of our great public men of those times, devoting their energies and talents to the development of that intertwining net-work—stronger than steel or sentiment—of material interests, aggregating the giant power of the republic of our grand and glorious Union.

Sir, with no moral question now dividing the sentiment of our 50,000,000 of free citizens into bitterness of spirit or soulless faction, well may we utter, in the fullness of our hope, "*Esto perpetua.*" And while a spark of patriotism slumbers in our breasts, or judgment dictated by reason sits at the helm of legislative power, it can manifest itself with no greater wisdom than in the inauguration and rigid enforcement of a policy which will extend the ramifications of these material interests until they permeate the autonomy of all the States, as the arterial system our bodies, giving strength and power to each State, while it magnifies resplendently the strength and power of the whole Union nationally.

I feel a just pride in the advocacy of the measure included in the terms of the bill now under consideration as a work the Government should undertake and build, for the reason that the State I have the honor in part of representing, from the earliest period of the Revolution, has always stood in the vanguard of enterprise in furnishing material aid to every undertaking which offered encouragement in the promotion of the development of the internal resources of the State, originating at that period a spirit which commended itself so highly to the other States of our Union, until in 1824 President Monroe, as I shall show hereafter by a quotation from his message, called the attention of Congress to the development of the internal resources of the whole country by means of internal improvements as a matter of national concern. And it is due to a true presentation of the great project contemplated in this measure that the country should intelligently appreciate why that spirit of internal improvement which absorbed the attention of our public men in its early history in the building of wagon-roads and canals should not now equally command the wise counsel and energetic action of the statesmen of this generation.

Until the introduction of the pioneer railroad of America in the year 1828 wagon-roads and canals were the only highways of commerce that supplied the means of conveyance for the products of agriculture, mines, and manufactures to market, and Congress, as well as the Legislatures of the several States, each had their projects for different improvements. The Cumberland and National road was the first regular internal work undertaken by the Government, out of which sprung the bitter discussion of State rights. By act of Congress approved April 30, 1802, among other provisions was one dedicating one-twentieth of the proceeds arising from the sale of the public lands in the territory mentioned in the bill toward the laying out and making public roads from the navigable waters emptying into the Atlantic Ocean through to the Ohio River and through the State of Ohio. Other acts confirming, amending, and enlarging this great western route were passed by Congress in the years 1810, 1811, and 1815.

In all the Government expended some \$3,000,000 of the public money, and in the course of time Baltimore and other leading cities connected themselves therewith by means of turnpike roads. Before the development of this project, forming as it does an interesting part of the history of the efforts of the public-spirited men of America to open up routes of easy and convenient communication between the remote settlements of our infant country and the Atlantic seaboard, the intelligent energy and engineering experience of Washington may be appropriately referred to as a further indorsement both of the vital importance to the States severally of such expenditures as a means of development of their rich resources as

well as of the propriety of the Government assuming the cost of construction of such transportation highways, involving the primary obligation of the Government to supply the wants and necessities of interstate commerce.

As early as the year 1762 he projected a scheme of water improvements by the route of the Potomac River, from Fort Cumberland, at Wills Creek, to the Great Falls, which comprised a part of what was known as the movement of the "Ohio Company," organized for the settlement of the large tracts of western lands within the borders of Ohio, whose rich productive power invited the industry of man. The "Potomac Company" was formed in Maryland, but the war for Independence summoned this great spirit, busy with the arts of peace, to the leadership of the untired legions of the Colonies in their great struggle for liberty; but when success was assured and victory emerged from the dark clouds of our seven years' war the splendid commander of our gallant army of patriots, radiant with glory and destined to fill a niche in the temple of fame as "the first in war, the first in peace, and the first in the hearts of his countrymen," returned to the thread of his care and took up with renewed ardor his cherished schemes of internal improvement, recognizing as he did that the free people of America had the most difficult task yet to perform in confirming and perpetuating that liberty and independence, the rich fruits of our bloody Revolution.

Through his efforts and influence the concurrent action of Virginia and Maryland was secured; the Potomac Company was rehabilitated and its capital stock subscribed. But Washington was called to preside over the destinies of our young Government as its executive head; and in his farewell address gave proof of the faith that was in him, and of his judgment favoring as of vital importance to the unity of our Government the interwoven material and diversified interests of the States included in the wants of the sections to be supplied by interstate communication. He said:

The name of American, which belongs to you in your national capacity, must always exalt the just pride of patriotism more than any appellation derived from local discriminations. With slight shades of difference, you have the same religion, manners, habits, and political principles. You have in a common cause fought and triumphed together; the independence and liberty you possess are the work of joint councils and joint efforts—of common dangers, sufferings and success. But these considerations, however powerfully they address themselves to your sensibility, are greatly outweighed by those which apply more immediately to your interest. Here every portion of our country finds the most commanding motives for carefully guarding and preserving the union of the whole. The North, in an unrestrained intercourse with the South, protected by the equal laws of a common Government, finds in the productions of the latter great additional resources of maritime and commercial enterprise and precious materials of manufacturing industry. The South, in the same intercourse benefiting by the same agency of the North, sees its agriculture grow and its commerce expand. Moving partly into its own channels the seamen of the North, it finds its particular navigation invigorated, and while it contributes in different ways to nourish and increase the general mass of the navigation it looks forward to the protection of a maritime strength to which itself is unequally adapted. The East, in like intercourse with the West, already finds, and in the progressive improvement of interior communication by land and water will more and more find a valuable vent for the commodities it brings from abroad or manufactures at home. The West derives supplies requisite to its growth and comfort, and, what is perhaps of still greater consequence, it must of necessity owe the secure enjoyment of indispensable outlets for its own productions to the weight, influence, and the future maritime strength of the Atlantic side of the Union, directed by an indissoluble community of interest as one nation. Any other tenure by which the West can hold this essential advantage, whether derived from its own separate strength or from an apostate and unnatural connection with any foreign power, must be intrinsically precarious.

The scheme of the Potomac Company failed in 1820 because of the impracticability of the improvement of the bed of that river to answer the purposes intended, and it was accordingly merged into the now Chesapeake and Ohio Canal Company. In the December session of Congress, 1823, President Monroe brought the subject before that body, who appropriated \$30,000 for the purpose of procuring the necessary surveys, plans, and estimates. In his inaugural address he spoke as follows:

Other interests of high importance will claim attention; among which the improvement of our country by roads and canals, proceeding always with a constitutional sanction, holds a distinguished place. By thus facilitating the intercourse between the States we shall add much to the convenience and comfort of our fellow-citizens, much to the ornament of the country, and what is of greater importance, we shall "shorten distances," and by making each part more accessible to and dependent upon each other we shall bind the Union more closely together. Nature has done so much for us by intersecting the country with so many great rivers, bays, and lakes approaching from distant points so near to each other, that the inducement to complete the work seems to be peculiarly strong.

Again, in his first annual message, he adds:

When we consider the vast extent of territory within the United States, the great amount and value of its productions, the connection of its parts, and other circumstances on which their prosperity and happiness depends, we cannot fail to entertain a high sense of the advantage to be derived from the facility which may be afforded to the intercourse between them by means of good roads and canals. Never did a country of such vast extent offer equal inducements to improvements of this kind, nor ever were consequences of such magnitude involved in them.

And although further on in the same message Monroe announced the constitutional opinion that Congress did not possess the power to do what his judgment told him should be done by the General Government in the line of internal improvement, he deemed the subject of such vital importance as to earnestly recommend an amendment to the Constitution, and remove the doubt that stood an obstacle to the constitutional exercise of the power. Succeeded in the Presidential office by John Quincy Adams, who, referring to the work of his predecessor in the line of internal improvements in his inaugural address, said:

To the topic of internal improvement emphatically urged by him (President

Monroe) at his inauguration I recur with peculiar satisfaction. It is that from which I am convinced that the unborn millions of our posterity who are in the future ages to people this continent will derive their most fervent gratitude to the founders of the Union; that in which the beneficent action of its Government will be most deeply felt and acknowledged. The magnificence and splendor of their public works are among the imperishable glories of the ancient republics. The roads and aqueducts of Rome have been the admiration of all after ages, and have survived thousands of years after all her conquests have been swallowed up in despotism or become the spoil of barbarians.

And so, Mr. Speaker, I might continue to add the testimony of other great statesmen whose minds have left their indelible impress upon the character of the country, and point with exulting pride to the splendid realization of their prophetic wisdom, in the magnificent results of less than a century of development marking our present condition—a full-grown forest of wealth sprung from the acorn-cup. But, sir, a new era dawned upon the American mind, sprung from the loins of invention, embodied in the awakened power of steam as applied to railways; and, since the extended introduction of the railroad system, reaching in its ramifications the resources of nearly every State and Territory, inclosing the commerce of the country in a net-work of steel and iron, the policy of constructing canals, except for the purpose of shortening distances in continuation of established routes to the ocean as an aid to interstate communication, has been entirely and wisely abandoned. And it is in this view alone such projects, sprung from what quarter of the country they may be, can be said to assume the character and dignity of national importance, imposing primarily the duty upon Congress to provide for their speedy construction, in the development of the agricultural, manufacturing, and commercial greatness of the whole Union.

The importance of the object of this legislation asked for in cutting a water-way across the peninsula of Maryland and Delaware early became a subject of public discussion, even before the revolutionary war, and sooner or later in the stern order of necessity marking the steady march of progressive improvement it must be built, in defiance of all opposition. In no sense can it be classed as a local measure, the far largest share of advantage, commercially speaking, that must inevitably result from its construction accruing to the great and powerful agricultural communities comprising the tier of States and Territories west, northwest, and southwest, in the more rapid development of the hidden wealth of their mines and the untold acreage of rich arable land that now lies neglected and uncultivated. According to the census return for 1850 this ocean of wealth is shown by the following table:

	Acres.
Illinois	5,924,044
Wisconsin	6,190,590
Minnesota	6,156,326
Iowa	4,886,159
Missouri	11,134,245
Kansas	10,096,883
Nebraska	4,440,124
Dakota	2,650,243
Texas	23,673,620
Arkansas	8,465,944
Kentucky	10,696,883
Tennessee	12,174,702
Georgia	17,920,237
Alabama	12,479,628
Mississippi	10,963,078
Louisiana	5,553,594

Total 151,686,230

These States are more or less directly or indirectly interested in the construction of the Maryland and Delaware free ship-canal, furnishing as it will, by two hundred miles, a shorter route to foreign markets for all the varied products of the labor of their people, as collected and distributed by Chicago, Saint Louis, Cincinnati, Louisville, and other leading *entrepôts* of this powerful section of our common country; also in the increased production that must necessarily flow from the impetus given to the commercial and industrial forces working with sleepless vigilance within their borders; as well in the regulative influences operating upon transportation rates, the cost of which impinges so largely upon the profits of the producer, on account of the bulk and weight of the traffic usually moved from these sections of the country.

The States of Illinois, Iowa, Wisconsin, Minnesota, Missouri, Nebraska, Kansas, Arkansas, and Texas, and the Territory of Dakota are most directly and vitally interested in the proposed canal both for their west-bound as well as their east-bound traffic, and they have a population and area as follows:

States, &c.	Population.	Area of square miles.
Illinois	3,077,871	55,410
Iowa	1,624,615	55,045
Wisconsin	1,315,497	83,531
Missouri	2,168,380	65,350
Nebraska	452,402	75,999
Kansas	996,096	80,899
Dakota	185,177	52,198
Arkansas	802,525	274,356
Texas	1,591,749	642,780
Total	12,164,312	642,780

These produced in the year 1880, as reported in the official census, the following quantities of the principal cereals:

States, &c.	Wheat.	Corn.	Oats.	Barley.
Illinois	51,110,502	325,792,481	63,180,200	1,229,523
Iowa	31,154,205	275,024,247	50,610,591	4,022,588
Wisconsin	24,384,689	34,230,579	32,905,320	5,043,118
Minnesota	34,601,030	14,331,741	23,382,158	2,972,965
Missouri	24,966,627	202,485,723	20,670,958	123,031
Nebraska	13,347,007	65,450,135	6,555,875	1,744,586
Kansas	17,324,141	105,729,825	8,180,385	300,273
Dakota	2,830,289	2,000,864	2,217,132	277,424
Arkansas	1,269,730	24,156,417	2,219,822	1,952
Texas	2,567,760	29,065,172	4,893,359	72,786
Total	203,555,981	1,078,266,684	214,824,800	15,788,246

RECAPITULATION.

	Bushels.
Wheat	203,555,981
Corn	1,078,266,684
Oats	214,824,800
Barley	15,788,246

Grand total..... 1,511,435,711

There was produced in all of the United States of these four cereals, as shown by the same census report, as follows:

	Bushels.
Wheat	459,479,505
Corn	1,754,861,535
Oats	407,858,999
Barley	44,113,495

Grand total..... 2,666,313,534

These statistics demonstrate more cogently and eloquently than any language of passion the great importance to the whole country of this magnificent development of this portion of it, the luscious fruits of fifteen years' activity of the commercial and industrial power underlying the energy of the American people. Sir, enormous as these aggregates are, they are quite insignificant as compared with the vast and rapid increase which has transpired year by year, the genius of our country's wealth moving and accumulating with the colossal stride of a growing giant. Thus, in the year 1865 the total wheat production of the United States was but 151,999,906 bushels, while in 1880 these nine States and one Territory exceed by 51,556,075 bushels the production of the entire Union; and so the comparison holds with reference to the other of the four cereals selected for illustration.

The total exports of grain during the year ended June 30, 1880, (wheat flour, corn-meal, and rye flour being reduced to bushels,) amounted to the large sum of 284,707,808 bushels, of which 180,304,181 bushels consisted of wheat, and 99,592,329 bushels of corn. The totals of both wheat and corn amounted to 279,876,510 bushels, and constituted 97.25 per cent. of the total exports of grain during that year. The year 1872, says Mr. Nimmo, appropriately marks the beginning of the transportation of grain by rail from points as far west as Chicago to the Atlantic seaboard, when the exports of wheat from the United States increased from 26,423,080 bushels to 153,252,795 bushels in 1880; the exports of wheat flour increased from 2,514,535 barrels in 1872 to 6,011,419 barrels in 1880; and the exports of corn increased from 34,491,650 bushels to 98,169,877 bushels during the same brief period—an increase, he declares, constituting one of the most remarkable developments of commerce ever recorded in the commercial history of this or any other country.

The increase of production and exportation of cereals, almost wonderful in its details, does not exist independent of the commercial and industrial forces which are constantly operating with almost magic power wielding an influence as noiseless but as effective as the wand of Prospero. What accomplished these magnificent results, this grand aggregation of values? I know there are many people who in the innocency of their ignorance are like poor Topsy, in Uncle Tom's Cabin, unable to understand who made her, declared in the simplicity of her nature, "she reckons she must have just growed;" so they look upon this most wonderful advance as a mere growth, without reference to the moving influences which, spirit-like, permeates the intelligent body of trade and business. Nevertheless, the bone and the sinew, the muscle and the tissue of this living organism are there, and throughout the organized body of wealth courses the golden stream of its life, giving it action, strength, and power; and I ask, Mr. Speaker, is its expansion into still mightier proportions to be inhibited by the action of this Congress in the denial of those means usual and ordinary as aids and auxiliaries?

Sir, to the interminable iron rivers of commerce which comprise the railroad system of America, in the facilities afforded for the transportation of the surplus products of the West to the seaboard, is mainly due this development. The total receipts of flour and grain at the five principal Atlantic sea-ports of the United States during the year 1880 amounted to 319,696,057 bushels, of which the receipt of those ports by rail was 246,068,517 bushels, or 76.97 per cent. Mr. Nimmo says prior to 1872 only a small portion of the exports of grain from Boston, Philadelphia, and Baltimore was the product of the Western and Northwestern States, but at the present

time, 1880, the grain exported from these three ports, as well as that exported from New York, is chiefly of Western production. The total value of the foreign commerce for the year 1881, embracing both exports and imports, amounted to \$1,675,024,313; larger than during any previous year in the history of the country. Total value of exports for the same year was \$902,377,346, exceeding those of the preceding one \$66,738,688. Of this aggregate of our foreign traffic \$772,646,972 was imported merchandise, showing an excess of exported values amounting to \$129,730,374. During the ten years ended June 30, from 1863 to 1873 the values of our imports were in excess of our exports, ranging from \$39,371,368 in 1863 to \$182,417,419 in 1872, since which time, and during all this period, inclusive of June 30, 1881, the excess of our exports over imports has placed the balance of trade in favor of the United States, turning the stream of foreign gold into the lap of our country, and establishing our specie resumption, with all its accruing beneficent advantages, upon foundations of financial adamant. But I proceed in my analysis of this development, and I find that of the total export values for the fiscal year 1881, before stated, \$883,925,947 was domestic merchandise, exceeding the previous year \$59,979,594, and of this splendid sum 90 per cent. was constituted in the eight commodities and classes of commodities as follows:

Bread and breadstuffs.....	\$270,332,519
Cotton, and manufactures of.....	261,267,133
Provisions.....	151,528,268
Mineral oils.....	40,315,609
Tobacco.....	20,878,884
Wood, and manufactures of.....	18,600,312
Iron and steel manufactures.....	16,608,767
Live animals.....	16,412,398

Total..... 795,943,890

In the decade from 1871 to 1881, June 30, the increase was from \$428,398,908 in 1871 to \$883,925,947, as stated before, amounting to the grand aggregate of \$445,527,039, an increase which was mainly due to the large export of breadstuffs, provisions and tallow, cotton and its manufactures, live animals, leather and its manufactures, and wood and its manufactures, constituting 82.12 per cent. of all the increase of domestic merchandise, as exhibited by the following table:

Commodities.	Value of exports during year ended—		Increase.
	1871.	1881.	
Bread and breadstuffs.....	\$79,381,187	\$270,332,519	\$190,951,332
Provisions and tallow.....	41,873,254	158,328,896	116,455,642
Cotton and its manufactures.....	221,885,245	261,267,133	39,381,888
Live animals.....	1,019,604	16,412,398	15,392,794
Leather and its manufactures.....	1,897,395	8,068,445	6,191,050
Wood and its manufactures.....	12,916,542	18,600,312	5,683,770
Total increase in the export of above articles.....			374,059,476

Of all this increase the value of the breadstuffs, provisions, tallow, and live animals, which together amount to \$332,802,768, constituting 79.5 per cent. of the aggregate, are chiefly the products of the tier of States and Territories directly interested in the construction of the Maryland and Delaware free ship-canal, a result which most naturally flows from the extended development of the means of interstate communication by railroad and water-way, but largely is due to the reduction in transportation charges.

By the report of the railway commissioner for the year 1881 we are advised "that the railway construction has proceeded at such a rapid and unprecedented pace during the present year that it has been more difficult than ever before to keep an accurate record of its progress." From the incorporation and inauguration of work upon an extraordinary number of new enterprises on which definite engagements have been entered for construction the estimate is made as follows:

Between the Atlantic coast and the Upper Mississippi River, and north of the Ohio and Potomac Rivers, 4,791 miles.

Between the Atlantic coast and Mississippi, and south of the Ohio and Potomac, 2,352 miles.

Between the Rocky Mountains and Mississippi River, and south of the latitude of Saint Louis, 4,140 miles.

West of the Rocky Mountains, 540 miles. Making a total of 15,886 miles of railroad expected to be laid between October 8, 1881, and December 31, 1882.

And when we remember the fact that the aggregate of miles of all the railways in the United States, as shown by Poor's Manual, is 93,669.50 miles, the predicted increase must give quite an impetus to the present immense development of production, by reason of this enlarged field of its operations, as well as augment the aggregate of values for delivery to the various commercial *entrepôts* of the country, both for home consumption and exportation, reaching as these new lines will rich producing areas not hitherto drained by the rail rivers of commerce, whose values have tempted the investment of the large capital necessary to inclose it within the embrace of trade enterprise.

Sir, the trade growth of the country, already so enormous, so remarkable, and without a parallel in the commercial history of the world, increased in the ratio of past experience by this rapid development of our interstate communication, annually going on, in a very brief period of time must inevitably outgrow the capacity of any one single Atlantic seaport, possessed of adequate western connections to discharge it to a foreign market; and large-hearted, liberal-minded business men of all sections of the country, surveying the horoscope of our commercial future, when our population will be a hundred millions instead of fifty, already express grave anxiety for the coming condition of American productions and are casting about for means to prevent a glut of exports at the seaboard.

Now, Mr. Speaker, while this remarkable development of the material wealth of the West, Northwest, and Southwest, shadowed forth by these leading elements, constituting the fruits of the industrial and commercial forces at work in these States and Territories, speaks trumpet-tongued to their Representatives on this floor of the necessity and importance to them for a still greater progress in the means of interstate communication, both by rail and water-way, in their extension to every county of every State and Territory in this broad land, and also in the cheapening of transportation charges by shortening continuous through routes of the great arteries of trade and commerce leading to the Atlantic seaboard, which are to bear upon their bosom the rich argosies of a more extended production of values, as the ocean floats the mighty navies of the world, so they voice forth to the East and the South a no less uncertain sound in proclaiming the rich harvest of benefits to be reaped as the ripened fruits of the commercial and industrial forces, inspiring the energies of these sections of our common country in the development of the wealth constituting the work of their people, in the mine, at the forge, or the loom, in the cotton and rice fields, or the sugar plantation, or in whatever direction the invention, skill, and labor of man expends power in the production of values.

Here, I desire to refer to the report of Mr. Nimmo for confirmation of what I have said in expectation of further effort in this direction, "that the value of products of agriculture exported from the United States during the years 1830, 1840, 1850, 1860, 1870, and 1881, respectively, showed a fluctuation of only about 3 per cent. of the total values of exports of domestic merchandise. This indicates that the growth of the exportation of commodities other than products of agriculture kept pace with the astonishing growth of the exportation of the products of agriculture." And it heralds the wisdom of that policy so early inaugurated by the statesmen of America in the encouragement of agriculture, of manufactures and of its handmaid, commerce.
